

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE
ANNUAL REVIEW;
AND
HISTORY OF LITERATURE.

CHAPTER I.

VOYAGES AND TRAVELS;

NARRATIVES of voyages and travels, and foreign topography, are of all books, perhaps, the best calculated to excite a strong and general interest in the reading part of the community; every class of which, from the mere lounge, with whom reading is only a creditable kind of idleness, to the philosopher, who derives from books the materials of useful contemplation, is almost equally interested in the faithful narrative of the traveller. Nor is there any reason to fear that this department of literature should ever become exhausted; accidental causes may superinduce a temporary dearth, but the curiosity of the public will never fail to encourage and recompence those adventurous spirits, who, after penetrating into foreign countries, to gratify their own love of novelty, will allow their fellow countrymen to indulge theirs from the same source. The navigator, it is true, must ere long find his employment, as far as regards the discovery of new lands, almost entirely concluded, and with much more reason than Alexander may complain of the diminutiveness of the globe that he is destined to inhabit; but this very circumstance will probably conduce to the public benefit, by withdrawing the researches of science from the barren ocean and the sea-beat shore, and encouraging them to penetrate the vast tracts of land, as yet, almost wholly unknown to Europeans, though inhabited by man in various stages of civilization, and presenting, to the lover of nature, an inexhaustible store of the wonderful, the beautiful, and the new.

Of America, though under the dominion of Europe, and colonies from Europe, we know less than even of Africa; it is therefore with peculiar satisfaction, that we perceive an increasing curiosity concerning the transatlantic Continent, and that it begins to attract the attention of travellers: no less than six of the books noticed in the present chapter, refer to this quarter of the world, and although the information

which they contain is imperfect, and probably, in many respects inaccurate, yet we are inclined to welcome them perhaps more than they deserve, as good omens, and the harbingers of better and more accurate researches.

Political circumstances have excluded British travellers from the territories of France and her allies; and the other parts of the continent being but little attractive. Mr. Carr's northern summer, being a tour through Norway and Sweden to Petersburg, is the only account worth mentioning of any part of Europe that has issued, during the last year, from the English press.

The discussions in parliament respecting Pulo-Penang (Prince of Wales's Island), have given birth to two small topographical descriptions of this little island. The solitary rock of St. Helena has also found a sensible and able historian.

Captain Beaver's African memoranda merit the serious study of all future leaders of colonies to the western coast of that continent; and Mr. Turnbull's voyage round the world deserves mention, as being the latest account of the singular political changes that are going on in the Sandwich Islands, and some other of the Polynesian groups.

ART. I. *Travels to Discover the Source of the Nile, in the Years 1768, 1769, 1770, 1771, 1772, and 1773.* By JAMES BRUCE of Kinnaird, Esq. F. R. S. 7 Vols. 8vo. and 1 4to. Vol. of Plates. The Second Edition, corrected and enlarged; to which is prefixed a Life of the Author.

WAS Bruce ever in Abyssinia, and are the sources which he describes, the real sources of the Nile? These facts have been questioned with little urbanity, little candour, and much malevolence.

The first fact will now no longer be contradicted. After the positive testimony which sir William Jones accidentally found in India, he who denies that Bruce was in Abyssinia, and as he himself states, in high favour at Gondar, must be a wilful calumniator. But did he visit the sources of the Nile? "The Bahr el Azrek, or Blue River, says Mr. Pinkerton, was mistaken for the real Nile by the Portuguese writers Alvarez, Tellez, &c. probably misled by the vain glory of the Abyssinians; though it was well known to the ancients as quite a distinct river, the Astapus, flowing into the Nile, from the Coloe Palus, now the lake of Dembea. Mr. Bruce's vanity led him to adopt the same mistake."

That the Abyssinian branch is the Astapus of the ancients is sufficiently clear, and also that Herodotus and Ptolemy considered the Bahar el Abiad as the Nile. But it is equally certain that the Abyssinians themselves consider their branch to be the Nile; as such it is described by the Jesuits and laid down in the map of Balthazar Tellez; this was the opinion of Ludolphus, this was the

general opinion in Europe when Bruce set out upon his travels, and this opinion he found in Abyssinia, in Atbara, and in Nubia, not only in the country where the Bahar el Asrak rises, but also where it joins the other stream. There is decisive proof that this is not a mere boast of national vanity among the Abyssinians, but actually and *bona fide* their belief, a received opinion upon which they have formed a great, though visionary, political project, which they once proceeded to put in practice. Lalibala began to divert the course of his Nile for the purpose of famishing Egypt: in the first intercourse which took place between the Portuguese and the Abyssinians this project was renewed, and had Albuquerque lived, there can be no doubt but that the execution would have been again attempted.

If Bruce, therefore, has mistaken the Astapus for the Nile, it is a very pardonable mistake, for if there be not authority sufficient to establish his opinion, there is surely enough to excuse his error.

The question itself, however, is *infinitesimally* insignificant. The Bahar el Asrak, and the Bahar el Abiad, meet and form the Nile; which is to be called the Nile before the junction? The dispute is not concerning the course of the water, but concerning the name. If indeed the

the Nile had been regularly christened, and a certificate from the church register could be produced, the point might be decided. But to whom does the right of godfatherhood belong in this case? Why to the Donga and Tuclawi, the people of the Deir and Tuggula, more than to the Abyssinians and the Agows of Geesh? They who reside about the junction, call the united stream by the name of the Abyssinian branch: if authority is to determine the point, where can we go for a better jury than to the place itself? The Bahar el Abiad is the larger branch: Bruce expressly says that it is so, but his editor very properly observes, if they who dwell by the junction continue the name of Bahar el Asrak after it has joined a larger branch, it is plain that they consider the larger branch as received into the smaller, not the smaller as received into the larger. It is the straight course which determines these unlettered surveyors. Striking instances, he says, occur in our own country, of rivers being named from the inferior source, and he adduces a case in point. The largest river in Scotland is formed by the Teith and the Forth, the latter of which is a stream as much inferior to the former as the Bahar el Asrak to the Bahar el Abiad. The inferior stream, however, in spite of the decision of several respectable writers in favour of the Teith, obtains the name of the great river, because it runs in the same* line. A river must have as many sources as a man has grandfathers in the fiftieth degree, and in the one case as well as in the other we trace to the straightest line.

True it is that Bruce himself considered the discovery of the sources of the Nile as a thing of great importance; honourable not only to himself but to his age and country, and to the king under whose reign it was accomplished. In this respect he was as absurd as his critics. But this folly does not in the slightest degree detract from the value of his work. The journey was not the less important because the object was ridiculous, as the value of an action is not to be estimated by the motive of the agent, though the merit of the agent is. Whatever be the name of a rivulet in Geesh,

we are equally interested by the picture of society in Abyssinia. A gap in history has been filled up.

There remains yet a third question—did Bruce actually visit these sources in Geesh, or has he merely copied the Jesuits accounts, and the Jesuits map? for whoever has inspected both can have not the smallest doubt, that in the map of Balthezar Tellez, these sources, and the course of the river, through the lake Dembea, are laid down precisely as they are by the English traveller. This question has been for ever settled by Mr. Murray, the editor of the present edition, whose undeviating candour and indefatigable industry, cannot be too highly commended. Of the journey to the sources, he tells us, there exist, besides the narrative in Mr. Bruce's own words, written as he went along, the complete journal by Balugani in Italian, and many of the strips of paper which he carried in his hand, *on which he wrote with a pencil the history of each day, before he entered it in the journal at night.* We will transcribe that part of Balugani's journal which describes the springs, because it sets the question for ever at rest.

"At three o'clock we have arrived at the church of St. Michael, above the sources; and at an eighth of a mile, descending from this into the plain, are found the *fountains of the Nile*. We have halted in the valley (or plain) called Assua, half a mile to the S. S. E. of these fountains. Our journey to day has been six hours, computed at twelve miles.

"The sum of the whole way, from Gondar to the fountains of the Nile is about one hundred and eleven miles.

"The fountains of the Nile are three. One of them *will be* four palms in diameter; but it is all full of rushes, and shews neither its depth nor true extent, it not being possible to introduce into it any sounding instrument.

"The second will be five paces distant from the first to the south, a little west; and will be about twelve inches diameter at the mouth, but within about four palms, and it is eight feet three inches deep.

"The third will be twelve paces distant from the first, to S. S. W.; its mouth is somewhat larger than that of the second, but it is only five feet eight inches deep. The first being the lowest, the water is seen at the level of the earth; but in the other two, the

* It is curious that the river should resemble the Abyssinian Nile in another very remarkable circumstance. The stream of the Teith is distinctly visible in its passage through Lochlubnaig, which indeed signifies *the Lake of the Winding Stream*.

† This expression is literal, and might be exchanged for *is*; though computation be in some cases understood.

ground being a little raised, the water remains about eight inches lower than the level of the mouth. All the three may be observed to spring (the word *bollore* signifies to boil or bubble), but so imperceptibly that it can scarcely be discerned by great attention; and it is false what is said by some, that they spring with a noise out of the ground, rising above it.

"All this place near the fountains produces only grass and rushes; trees are not found, to the distance at least of half a mile on every side.

The latitude of the fountains is 10 degrees 58 min. and 58 sec. The sources of the Nile are found in the Agow country, in a province called Sacchala.— They are situated in a little valley at the foot of the

mountain of Gheesh, by E. N. E. From the fountains to the top of the mountain will be two miles and a half, nearly three. Above the fountains, about one-eighth of a mile distant from them, by N. E. by N. is a church, on the top of a hill, called Kedus Michael, over the fountains. The Nile, rising out of its springs, takes a direction east for a quarter of a mile. Then it turns about to north-east for another half-mile, always in the middle of a plain (vallone), without trees or shrubs, excepting grass and rushes; and in all that space it does not appear to run; but as the earth is very flat, it spreads, and leaves the ground about, marshy, and (in) stagnant (water). From this it begins to run north, and in a short time becomes very rapid, and continues to flow by north-east and north, under the mountain, on which is the church of Mariam Nett, for the space of a mile. Thence it runs north-west about a mile. About that part is the place where they pass the Abay, to go to Gondar, coming from the fountains, and the church will be a quarter of a mile to the east distant from this passage. After having run the forementioned mile north-west, it turns about west, and a little after south-west, then south south-west, then south, always retreating backwards towards its sources in all that course. From the place where it begins to go west till it runs south will be about four miles and a half. In this last place it passes between two mountains, and begins to retreat, by going down by the way of west, north-west, north, &c. until it comes to cross the lake in an angle of it; it (then) passes near to Dara, and returning south makes the circle of Gojam, after which it descends (towards the north).

"Two miles before arriving at the place where it changes its course reverting towards its sources, are seen three small streams, one of which comes from the east, another from the south-east, and another from the south south-east; the two first of these arise to the north-east of the church of St. Michael Gheesh, about somewhat less than one-eighth

of a mile's distance. The first of these runs nearly parallel to the Nile, receiving about half a mile from its source the second, and then about three miles after the third; and about a mile and a half after that discharges itself into the Nile. The Nile in that place begins to grow large; because it receives there other small streams which come from the north and west."

A minute account follows of the bearings of the adjoining places, as marked from the top of the mountain of Geesh. The manuscript from which this is printed is in Italian, in Balugani's hand-writing, on the smooth cream-coloured cotton paper of the east. It contains a complete detail of the hours and days in which they travelled; of the villages, rivers, mountains, and in short, of every remarkable object they met with from their leaving Gondar, Sunday twenty-eighth October, 1770, at half after nine A. M. till their return, Sunday eighteenth Nov. one o'clock P. M. in the same year.

Such evidence is unanswerable. But could any thing be more absurd than to admit that Bruce was in Abyssinia, and yet to deny that he visited the sources of the Abyssinian Nile? These sources, says Mr. Pinkerton, were in the seventeenth century accurately described by Payz, a Portuguese missionary, whose account was published by Kircher and Isaac Vossius, and has in our times been very minutely copied by Bruce, as Hartman has explained by printing the two accounts in parallel columns. Mr. Murray has confused the charge in the best possible manner, without condescending to notice it. He has printed the passage as it stands in Kircher, and added a literal translation. In justice to him and to Bruce, we shall copy the two accounts.

"The source of the Nile is situated in the western part of the kingdom of Goyam, in the upper (or highest) part of a valley, which resembles a large plain, surrounded on every side with ridges of hills. A. D. 1618, April 21st. when I was living in this kingdom along with the emperor and his army, I ascended this place, viewed every thing diligently, and found at first two round fountains there, both above four palms in diameter, and with the greatest pleasure of mind saw what Cyrus, king of the Persians, Cambyzes, Alexander the Great, and the famous Julius Caesar, could obtain by no wishes. The water of the source is very clear and light, and agreeable to the taste; yet it must be known that these two fountains of the source have no outlet in the uppermost part of the plain of the mountain, but at the foot of the

mountain*. We tried also the depth of the fountains, and put a lance into the first, which, entering eleven palms, seemed to touch, as it were, some roots of the neighbouring trees entangled with one-another.

"The second fountain bears from the first east about a stone's cast; trying the depth of this, by putting in a lance of twelve palms, we found no bottom, but having tied two lances together, in length twenty palms, we tried the thing again; but not even then could we find bottom, and the inhabitants say that the whole mountain is full of water, of which they gave this sign, that all the plain about the fountain shook and bubbled, a plain mark of concealed water, and that, for the same reason, the water did not overflow at the sources, but threw itself out with very great force at the foot of them; and the inhabitants affirmed, as well as the emperor himself, who was present along with his army, that the ground had trembled little that year, on account of the great dryness of the season, but in other years it shook and bubbled so, that it could scarcely be approached without danger. The circumference of the place is like a round lake, the breadth of which may be a sling's cast."

"Further, the plain of the fountains of the Nile is difficult of ascent, on every side but on the north, where it is easily ascended. Below the mountain about a league, in a very deep valley, rises another river from the bowels of the earth, which however joins itself a little after to the Nile; they believe it has the same source with the Nile, but that, conducted under ground by secret channels, it rises first here. But the rivulet from the source, which breaks out below the mountain, runs a gun-shot to the east, then, winding suddenly, flows to the north, then, about the fourth-part of a league afterwards, a new river presents itself, dashing from the stones and rocks, to which two other rivers a little after join themselves, breaking from the east quarter; and so on, by receiving constantly one stream after another, the Nile increases remarkably. After a day's journey, it meets with a large river, that is called Jama (Jemma); then turning towards the west for twenty-five leagues, or thirty-five leagues from its sources, it next reflects its course to the east, winding into a large lake (situated in the province called Bed, and partly adjacent to the kingdom of Goyam, partly to that of Dambia), which it passes through in such a manner, as that the waters of the Nile shew a remarkable difference from the waters of the lake; and the whole stream, unmixed with the lake waters, holds on its course."

It is to be remembered also that Bruce has himself given in the text of his book the whole sum and substance of the very account by Pedro Paez (who was a Cas-

tillian and not a Portuguese) which he is accused of having stolen; omitting only a few trifling parts of no importance whatever, for the sake of brevity. Let his own account be now examined.

"In the middle of this marsh (that is, about forty yards from each side of it), and something less from the bottom of the mountain of Geesh, arises a hillock of a circular form, about three feet from the surface of the marsh itself, though apparently founded much deeper in it. The diameter of this is something short of twelve feet; it is surrounded by a shallow trench, which collects the water and voids it eastward; it is firmly built with sod or earthen turf, brought from the sides, and constantly kept in repair; and this is the altar upon which all their religious ceremonies are performed. In the middle of this altar is a hole, obviously made, or at least enlarged, by the hand of man. It is kept clear of grass, or other aquatic plants; and the water in it is perfectly pure and limpid, but has no ebullition or motion of any kind discernible upon its surface. This mouth, or opening of the source, is some parts of an inch less than three feet diameter; and the water stood at that time, the 5th of November, about two inches from the lip or brim, nor did it either increase or diminish during all the time of my stay at Geesh, though we made plentiful use of it.

"Upon putting down the shaft of my lance at six feet four inches, I found a very feeble resistance, as if from weak rushes or grass; and about six inches deeper I found my lance had entered into soft earth, but met with no stones or gravel. This was confirmed by another experiment made on the 9th with a heavy plummet and line besmeared with soap, the bottom of which brought up at the above depth only black earth, such as the marsh itself and its sides are composed of.

"Ten feet distant from the first of these springs, a little to the west of south, is the second fountain, about eleven inches in diameter; but this is eight feet three inches deep. And about twenty feet distant from the first, to the S. S. W. is the third source, its mouth being something more than two feet large, and it is five feet eight inches deep. Both these last fountains stand in the middle of small altars, made, like the former, of firm sod, but neither of them above three feet diameter, and having a foot of less elevation than the first. The altar in this third source seemed almost dissolved by the water, which in both stood nearly up to the brim; at the foot of each appeared a clear and brisk running rill; these uniting joined the water in the trench of the first altar, and then proceeded directly out, I suppose, at the point of the triangle, pointing eastward, in a quantity that would have filled a pipe of about two inches diameter."

* This is unintelligible; Kircher having misunderstood, or obtained an incorrect copy of the original.

"The Nile, keeping nearly in the middle of the marsh, runs east for thirty yards, with a very little increase of stream, but perfectly visible, till met by the grassy brink of the land declining from Sacala. This turns it round gradually to the N. E. and then due north; and, in the two miles it flows in that direction, the river receives many small contributions from springs that rise in the banks on each side of it: there are two, particularly one on the hill at the back of St Michael Geesh, the other a little lower than it on the other side, on the ground declining from Sacala. These last-mentioned springs are more than double its quantity; and being arrived under the hill whereon stands the church of St Michael Sacala, about two miles from its source, it there becomes a stream that would turn a common mill, shallow, clear, and running over a rocky bottom about three yards wide: this must be understood to be variable according to the season; and the present observations are applicable to the 5th of November, when the rains had ceased for several weeks. There is the ford which we passed going to Geesh, and we crossed it the day of our arrival, in the time of my conversation with Woldo about the sash.

"Nothing can be more beautiful than this spot; the small rising hills about us were all thick-covered with verdure, especially with clover, the largest and finest I ever saw; the tops of the heights crowned with trees of a prodigious size; the stream, at the banks of which we were sitting, was limpid and pure as the finest crystal; the ford, covered thick with a bushy kind of tree, that seemed to affect to grow to no height, but thick with foliage and young branches, rather to court the surface of the water, whilst it bore, in prodigious quantities, a beautiful yellow flower, not unlike a single wild rose of that colour, but without thorns; and, indeed, upon examination, we found that it was not a species of the rose, but of *hypericum*."

"Here, at the ford, after having stepped over it fifty times, I observed it no larger than a common mill stream. The Nile, from this ford, turns to the westward, and, after running over loose stones occasionally, in that direction, about four miles farther, the angle of inclination increasing greatly, broken water, and a fall commences of about six feet, and thus it gets rid of the mountainous place of its nativity, and issues into the plain of Goutto, where is its first cataract; for, as I have said before, I don't account the broken water, or little falls, cataracts, which are not at all visible in the height of the rains.

"Arrived in the plain of Goutto, the river seems to have lost all its violence, and scarcely is seen to flow; but, at the same time, it there makes so many sharp, unnatural windings, that it differs from any other river I

ever saw*, making above twenty sharp angular peninsulas in the course of five miles, through a bare marshy plain of clay, quite destitute of trees, and exceedingly inconvenient and unpleasant to travel. After passing this plain, it turns due north, receives the tribute of many small streams, the Gometti, the Gouguefi, and the Kebezza, which descend from the mountains of Aformasha; and, united, fall into the Nile about twenty miles below its source; it begins here to run rapidly, and again receives a number of beautiful rivulets, which have their rise in the heights of Litchambara, the semi-circular range of mountains that pass behind, and seem to inclose Aformasha: These are the Caccino, the Carnachiuli, the Gougueri, the Iworra, the Jeddelli, and the Minch; all which, running into the Davola, join the Nile something less than a mile west of the church of Abbo.

"It is now become a considerable stream; its banks high and broken, covered with old trees for the space of about three miles; it inclines to the north-east, and winds exceedingly, and is then joined by the small river Diwa from the east. It then makes a semi-circle, and receives Dee-ohha, turns sharply to the east, and falls down its second cataract at Kerr. About three miles below this cataract, the large, pleasant, and limpid Jemna, pays its tribute to the Nile. Though its course is now mostly north, through Maitsha on the east, and Aroossi and Sankraber on the west, it still is inclining toward the lake Tzana, and, after receiving the rivers Boha and Amalac Ohha, small streams from the west, and the Assar, Aroossi, and Kelti, large rivers from the east, it crosses the south end of the lake Tzana, for about seven leagues, preserving the colour of its stream distinct from that of the lake, till it issues out at the west side of it, in the territory of Dara, where there is a ford, though very deep and dangerous, immediately where it first resumes the appearance of a river."

Is there any greater resemblance between these descriptions than there necessarily must be between two descriptions of the same place, made at different times by different persons? if any thing remarkable is to be discovered in them, it is in the points of difference, not of agreement. But what motive for plagiarism can now be assigned? It is not pretended that the whole story of these travels is the impudent forgery of a man who was never in Abyssinia; what then was to prevent him from proceeding to Geesh? The difficulties and dangers of the journey were not likely to intimidate

* A plan of the windings of the Nile in the plain of Goutta is inserted by Balugani in the Journal. These are singularly numerous, and very much resemble, though on a different scale, what are called "the links of the river Forth," near Stirling, in Scotland.

man who had reached Gondar. And that he did visit Geesh is proved, as far as any such fact is capable of proof, by his own journal taken on the spot, and by the journal of Balugani. As for the resemblance between his account and that of Pedro Paez, both are alike because both are true; so also his map agrees with that in Balthezar Tellez, because both are made from authentic documents, not because one is copied from the other. Bruce has sinned against the jesuits, but not as a plagiarist.

That we are not disposed to depreciate the merit of this traveller must already have been apparent, and how highly we value his labours will presently be seen; but it must be confessed that the object of his journey was an unworthy one. It was the search after what was curious, not what was useful; a-kin to the pursuits of the collector and virtuoso, rather than of the philosopher. However great the effort, however valuable the result, vanity was the motive. Attributing an undue importance to the discovery of these sources, he unduly attempted to appropriate the whole merit of the discovery to himself. No passion so easily tempts to falsehood as vanity. He could not be content with being the *partner of Pedro Paez*, to use his own expression, and has therefore laboured with much disingenuity to prove that neither he, nor any of the jesuits had visited the sacred spot, the *Kebba* to which all his ambitious aspirations were directed. The extract from Pedro Paez published by Kircher, he says, was not in three manuscripts of that father's history which he examined at Milan, at Bologna and at Rome. He does not pretend to have read through these manuscripts, but only to have examined the place where this description ought to have been. Mr. Murray, however, is so well satisfied with the account in Kircher, as fairly to concede the point, and to declare it cannot be doubted but that Pedro Paez had visited the sources. On this head we are not so fully satisfied as the editor; whoever wrote the description in Kircher, certainly had seen the place which he describes; but if the passage is not to be found in the three manuscripts which Bruce consulted, it may very possibly have been inserted in that which Kircher used, by the transcriber, from the account of some other jesuit. This we suspect to have been the case, because Tellez, though he had the writings of Pedro Paez before him, does

not enumerate him among his authorities for the description of the springs. Our traveller may be right here: but on the other hand Tellez expressly mentions the patriarch Affonso Mendez, of whom Bruce as expressly says, that he never saw, nor indeed ever pretended to have seen the sources of the Nile. Bruce even hazards a hardier mistatement, asserting boldly that Tellez makes no mention of such a discovery. The work of Balthezar Tellez lies before us; he gives a description of the springs "as they are described in many annual letters, and many treatises by many jesuits who saw these secrets closely,"—*como em muytas annuaes e muytos tratados, escrevem muytos nossos religiosos que viram muy de perto estes segredos*. "The best witnesses among them, he adds, are our patriarch of Ethiopia, Dom Affonso Mendez, a man of the highest credit, and father Mansel d'Almeyda who relates it much at length, and father Jeronymo Lobo, all of whom curiously beheld it with their own eyes." Bruce has certainly been guilty of wilful misrepresentation here; and his critics have only dealt by him as he has dealt by the jesuits, with the same measure wherewith he meted, it hath been measured to him again.

A similar jealousy lest any person should share the imaginary honour of this discovery is discernible in his whole management respecting Balugani the Italian, who assisted him in his drawings, and kept a daily journal of their route, like himself. We suspect that the mention of his death (Vol. iv. p. 426) is purposely antedated, and introduced before the journey to the springs, least it should be known that he also had seen them, and been the partner of Bruce; for it is mentioned as having taken place before the journey, and as one motive which almost induced him to return without accomplishing it. This was not oversight. In the journal of the journey a servant is spoken of, who the editor tells us in a note was Balugani. In this proud and unfeeling language does he speak of his only literary companion, of the artist who shared all his dangers, and died in his service. Not one expression of respect, or kindness, or endearment towards this young man ever escapes him, —though the death of a dog whom one had taken from Europe into such a country should have made an Englishman shed tears. In no other instance does Bruce appear like a proud and hard-

hearted man, but it is the tendency of that mean passion which was in him so predominant, to warp the understanding and to deaden the heart.

So far then as regards Luigi Balugani, and the claim of the jesuits to the discovery of these sources, the errors in Bruce are misrepresentations, not mistakes; falsehoods, not inaccuracies. He was not ignorant of the truth, and he had obvious motives for concealing it. Many other errors occur in his work, which can only be called inaccuracies or blunders, and which must have proceeded from an undue reliance upon his own memory. Some of these we shall notice.

Bruce is speaking of the conquest of Spain by the Moors: he says—

“A great influx of trade followed the conquest; and the religion, that contained little restraint and great indulgence, was every where embraced by the vanquished, who long had been Christians in name only. On the other side, the Arabs were now no longer that brutish set of madmen they were under the Khalifat of Omar. They were now eminent for their rank and attainments in every species of learning. This was a dangerous crisis for Christianity, which threatened nothing else than its total subversion. The whole world, without the help of England, had not virtue enough to withstand this torrent. That nation, the favourite weapon in the hand of Heaven for chastising tyranny and extirpating false religion, now lent its assistance, and the scale was quickly turned.”

It is impossible to explain the gross ignorance of this paragraph. Charles Martel was the man who preserved christendom. As for England, it had not the slightest influence upon the continent of Europe till the Norman conquest.

“John I. king of Portugal, he tells us, after many successful battles with the Moors, had at last forced them to cross the sea and return vanquished to their native country. By this he had changed his former dishonourable name of Bastard, to the more noble and more popular one of John the Avenger.” John the First never fought a battle with the Moors in his life, till he crossed to Ceuta. They had been completely subdued in Portugal a hundred years before he came to the crown. The whole of this chapter is full of such errors. We know not whether they are his own, or taken from some French blunderer,—for the orthography

or rather kakography of many of the names is French.

Covillan, he says, (it should be Covilham) sent frequent dispatches from Abyssinia to the king of Portugal, who on his part spared no expence to keep open the correspondence. Of course it must have been carried on by the regular post-offices. He even describes the contents of Covilham's journal, and adds, that he sent a map with it. All this Bruce has dreamt by his own fire-side. The contemporary chroniclers of Joam II. all say that Covilham was lost, and the contemporary historians of Emanuel all say when he was found.

He wonders why no mention is made by Tellez of the three capuchins who were stoned to death at Gondar in 1714. The wonder would have been if Tellez had mentioned them, for he died in 1675 himself. One might almost suspect that Bruce never revised his own writings; he tells you that he has a Coptic MSS. three times as old as the books of Numa were in Pliny's days, that is, above two thousand five hundred years; and a few pages on he adds, that it is a Gnostic treatise. It would be tedious to proceed with instances which might be enumerated to great length. Enough has been adduced to show that he wrote often carelessly, and sometimes presumptuously, but such blunders do not affect the main value of his work.

Whichever be the source of the Nile, whoever may be the first European who beheld it, and whatever be the historical inaccuracies and trifling blunders of the traveller, the main value of his travels remains unaffected. This consists in the state of society which he has most admirably delineated, a state the most extraordinary in which any people upon the face of the globe exist. It has fallen to his lot to reside among a people half Jews, half Christians; half savages, half civilized; half black, half white, half cannibals;—a people standing in so little fear of God, that oaths and sacraments go even for less among them than they do at an election or a custom-house; yet in such dread of the devil that they will not spill water upon the ground lest it should splash some of his imps, and dare not travel in the night for fear of meeting him upon the road: so ignorant that they believe hyenas to be Jews in disguise, and oblige their blacksmiths * to live

* This is not mentioned by Bruce, but we give it on the authority of Francisco Alvarez, the first traveller into the country.

part from the rest of the community, as men who can have acquired such extraordinary skill from none but from the devil; and it must be confessed that certainly these artificers do practise the black art: a people, who, in direct violation of that hospitality which all savages practise, detain every stranger who is unhappy enough to venture among them, and who send for their patriarch from Cairo, lest the little learning and miserable remains of christianity among them should be utterly extinguished. Such is their known barbarity, that the unfortunate Copt who is condemned to be their primate, must be put in chains and sent into the country under a guard of janizaries, lest he should run away. This country Bruce describes, where the inhabitants live in such a state of insecurity that the saddle and bridle can never be taken off, nor the bit slipped from the horse's mouth while the roads are passable, nor the shield and lance hung up in the hall till the rainy season sets in, and brings with it what may there truly be called the truce of God;—a country where dead bodies are left in the streets of the metropolis for the hyenas;—where if the small-pox make its appearance, the neighbours surround the house and consume it, with all its inhabitants, by fire, —where they eat animals alive, and men and women intoxicating themselves together at these bloody feasts, satisfy their lusts publicly, like dogs, in open daylight!

There is not the slightest reason for disbelieving or distrusting any part of this description. It is authenticated by other accounts, as far as they go, coherent with itself, probable in all its parts. There is nothing which could have warped the veracity of the traveller here; nothing which could be affected by neglect of documents or failure of memory. It depends not upon single facts, but upon accumulation; the whole history of Abyssinia agrees with the representation, and every circumstance in their laws and manners, their forms, ceremonies, and customs, public and private, is in keeping.

No traveller ever left Europe better qualified to travel in safety, and to keep up the honour of his country. Well acquainted with the language of the people among whom he was adventuring, he took with him recommendations and safe conducts from the chiefs of their religion, and the different powers whom they most respected, or with whom they

were most connected. Without incurring the dangerous suspicion of being wealthy, he appeared as a noble, and was accordingly valued by others as he valued himself. His person and his personal qualities were such as to obtain and to secure respect; tall and powerful beyond the ordinary strength and stature of man, he excelled the barbarians of Abyssinia in their own accomplishments: his excellence in horsemanship delighted them, and his skill in the management of a double-barrelled rifle astonished people who did not fire the clumsy muskets of the Arabians without fear and trembling. Wherever human courage or human prudence can be of any avail, Bruce might have travelled safely; never offering an insult, never submitting to one,—not ambitiously exalting himself, not meanly self-abased, conferring favours instead of soliciting them,—fearless in times of danger, yet never losing sight of caution when in most security,—a soldier in the camp and courtier in the city—the friend of the great, the healer of the sick, the favourite of the woman. Long will it be before another so qualified shall undertake such a journey,—and any one less qualified would have perished in the attempt.

The historical portion of his work is valuable to collate with the jesuits' accounts, and to supply the chasm from the time of their expulsion to our own days; that part in which he himself bore a share is particularly interesting. When the intercourse between Abyssinia and Europe shall again be opened, and the nation humanized by future missionaries more fortunate than Pedro Paez (more able and more deserving they need not be; and unless, like the jesuits, they unite policy and religion they must fail)—whenever that happy age for Africa shall arrive, the inhabitants will read their own history in the writings of Yagoube the Englishman.

We have better books of travels in the English language; that is, books more uniformly good, and without the faults of this; but none that contains so much interesting matter. Encumbered as it is with theoretical dissertations, it excites a livelier and more abiding interest than any traveller of our own, or of any other country. This is partly because he was a witness of great events, and an actor in them; still more, because he knew so intimately the most important persons in the drama, and has so admirably delineated them. It has been said that Mi-

chael Sukul, the Ras, is such a character as Shakespeare would have conceived; nor is this commendation, high as it is, exaggerated. Other books may be better written, but there is none from which finer passages can be produced; and in these there are no tricks of composition, nothing that the Birmingham-manufacturers of plated style can counterfeit; it is the plain tale plainly told, the strong feeling naturally expressed. In the whole course of our reading, we remember nothing more deeply and lastingly impressive than the journey of Bruce across the desert.

It now remains to state what has been added to the present edition, either from the papers of Bruce, or by the labours of the editor. An account of the life and writings of Bruce precedes the work. It appears that the conclusive act, by which presbytery was established as the national religion of Scotland, was obtained chiefly by the address and policy of the founder of his family. Whoever has seen presbyterianism north of the Tweed, will understand what reason Scotland and religion have to be obliged to him. In his youth, Bruce was considered as of a consumptive habit, which there was the more reason to apprehend, as his mother and sister had both been cut off by that curse of our country. He had the happiness to be educated in England, because his father was attached to the house of Hanover, and feared lest he might be infected by the prevalent spirit of jacobinism in his own country. Accordingly he was placed at Harrow, where he distinguished himself. As he advanced towards manhood, the symptoms of disease became more threatening: he was tall beyond the measure of his years, his joints feeble, his breast weak, and subject to violent coughs on catching the slightest degree of cold. Care and exercise saved him. For his profession he would have preferred theology himself, and wished to have entered the English church. This predilection did not meet with the approbation of his father, and, in obedience to his advice, he entered at Edinburgh and commenced the study of Scotch law: but neither health nor inclination permitted him to proceed with this. India was the next object: he was advised to petition the court of directors, for the liberty of settling as a free-trader under its patronage. To forward this scheme, he went to London in

1753, the twenty-second year of his age: there he became intimate with the family of Mrs. Allan, the widow of an eminent wine-merchant, married the daughter, and entered into the business with the son. In his own opinion this marriage, which prevented him from adventuring to India, saved him from the dreadful imprisonment in the black hole. He was now settled in a prosperous business, and happy with a wife; but, before the end of the year, manifest symptoms of consumption appeared in Mrs. Bruce. Bristol hot-wells proved, as they always must prove in such cases, inefficacious: the south of France was then recommended, which was her native country; but she only lived to reach Paris, where her last moments were persecuted by the catholic clergy, according to their detestable custom. We copy a very affecting letter written shortly afterwards.

"Letter of Mr. Bruce to his Father.

"Dear sir, Marklane, Nov. 12, 1754.

"I received yours of the 28th ult. If I could be susceptible of more grief, I should have been much concerned for my good friend Mr. Hay; but my distress at present does not admit of augmentation. Death has been very busy amongst my relations of late. My poor wife, my kind uncle, * who had been always a tender father to me, both gone in eight months! God Almighty do with me as he sees best! When I reflect upon what I have suffered these three years past, I am much more inclined to pray for my life being shortened than for a prolongation of it, if my afflictions must have no end but with my being. My mind is so shocked, and the impressions of that dreadful scene at Paris so strongly fixed, that I have it every minute before my eyes as distinctly as it was then happening. Myself a stranger in the country; my servants unacquainted with the language and country, my presence so necessary among them, and indispensibly so with my dear wife; my poor girl dying before my eyes, three months gone with child, full of that affection and tenderness which marriage produces when people feel the happiness, but not the cares of it; many of the Roman catholic clergy hovering about the doors; myself unable to find any expedient to keep them from disturbing her in her last moments—Don't you feel for your son, dear sir, in these circumstances? But I will write no more; my afflicting you cannot alleviate my distress. I cannot, however, omit telling you an instance of lord Albemarle's very great humanity; he has been always a warm-protector of this house. The morning before my wife died, he sent his chaplain down to

offer his services in our distress. After hearing the service of the sick read, and receiving the sacrament together, he told me, in case I received any trouble from the priests, my lord desired I would tell them I belonged to the English ambassador. When my wife died, the chaplain came again to me, desired me to go home with him, and assured me, that my lord had given him orders to see my wife buried in the ambassador's burying-ground, which was accordingly done; and had it not been for this piece of humanity, she must have been buried in the common yard, where the wood is piled that serves the town for firing. I could not, however, leave her as soon as dead, as is the custom in England, but having ordered the mournful solemnity, with as much decency as is allowed in that country to heretics, at midnight, between the 10th and 11th ult. accompanied only by the chaplain, a brother of my lord Foley's, and our own servants, we carried her body to the burying-ground, at the Porte St. Martin, where I saw all my comfort and happiness laid with her in the grave. From thence, almost frantic, against the advice of every body, I got on horseback, having ordered the servant to have post horses ready, and set out in the most tempestuous night I ever saw, for Boulogne, where I arrived next day without stopping. There the riding, without a great coat, in the night time, in the rain, want of food, which, for a long time, I had not tasted, want of rest, fatigue, and excessive concern, threw me into a fever; but, after repeated bleedings, and the great care taken of me by Mr. Hay, I recovered well enough to set out for London on the Wednesday. I arrived at home on the Thursday, when my fever again returned, and a violent pain in my breast. The former is so far abated, that I am endeavouring to do a little business, hoping, from the variety of that, to find some ease from reflections that at present are too heavy for me. Thus ended my unfortunate journey, and with it my present prospect of happiness in this life."

He continued in the trade several years, and, in the course of business visited Spain, and Portugal, and France. Before this journey he had studied the languages of these countries, and improved himself in drawing. As his journals remain, we cannot but wish that all which is interesting in them had been inserted in this memoir: it might well have supplied the account of his writings, which, however fit for a biographical dictionary, is surely out of place when prefixed to the writings themselves. The following passage is given by the editor as a specimen of these journals.

"There are many particular customs in Portugal, all of which may be known by this rule, that whatever is done in the rest of the

world in one way, is in Portugal done by the contrary, even to the rocking of the cradle, which I believe in all the rest of the world is from side to side, but in Portugal is from head to foot. I fancy it is owing to this early contrariety that their brains work in so different a manner all their lives after. A Portuguese boatman always rows standing, not with his face, but his back to the stern of the boat, and pushes his oar from him. When he lands you, he turns the stern of the boat to the shore, and not the head. If a man and woman ride on the same mule, the woman sits before the man, with her face the contrary way to what they do in England. When you take leave of any person to whom you have been paying a visit, the master of the house always goes out of the room, down stairs, and out of the house, before you, to leave you, as he says, in possession of his house, and to shew you how much he, and all that are in it, are devoted to you. They are, indeed, very attentive to the smallest punctilio, knowing well one another's temper. The smallest affront is never forgiven. This is the occasion of the many murders which are continually committed here. It is, indeed, the only country where it can be said that murder is tolerated. Every family has a son, a brother, or a nephew, who is priest, or friar. These are the instruments. As soon as the friar has committed the crime, he flies to his convent; and in six months the thing is no more talked off."

Much of this is prejudice, and the latter part is false. A curious anecdote occurs in another note. On arriving at Coimbra they visited the principal library, but none of the friars could tell where the Greek books were kept. Mr. Bruce's friend having been there on a former occasion, accidentally found one; and, on asking the friars in what language it was written, they answered, *He alguma das linguas muertas*, it is one of the dead languages.

In Spain he made some effort to obtain access to the Arabic MSS. in the Escorial. Don Ricardo Wall, the then minister, wished to engage him in the service of Spain, but did not, or could not, assist him in this plan. It seems that the observations which he had made in Spain were new and considerably numerous; but in consequence of an early resolution, which he never violated, he had determined to publish nothing on any subject which others had exhausted, or might easily illustrate—a resolution springing from that vanity which was his predominant fault.

During this journey his father died and he succeeded to a respectable inheritance, though not equal to his growing

ambition. In 1761 he left the wine business. He had seen a battle at Crevelt without being engaged in it, and had conceived a passion for military enterprise. Having procured a plan of the harbour and works at Ferrol from some person in the Spanish service, he projected a scheme for attacking it, a Spanish war being then expected, and through his friend Mr. Wood, then under secretary of state, laid it before the ministry, adding, that if the king would entrust him with the command of the forlorn hope, and a pair of colours, he would not desire the assistance of another boat except that in which he landed, till he had planted them with his own hand on the beach of Ferrol. He conceived himself justified in this, because models of the newest British ships of war had been secretly procured by the Spaniards. The justification is not admissible; nothing can justify a man of honour for performing the work of a spy.

The plan was approved, but laid aside for the sake of sending nearer relief to Portugal. He was preparing to return to Scotland, when lord Halifax requested to see him.

"On meeting with him, his lordship laughed at Mr. Bruce's design of retiring to the country at his time of life; suggested to him, that the way to rise in the present reign, was by enterprise and discovery; and that his majesty's love of the arts was a sure and effectual introduction to patronage. He observed, that Africa, though almost at our very door, was yet unexplored; that Dr. Shaw, a writer of undoubted credit, had spoken of magnificent remains of architecture existing in the kingdoms of Tunis and Algiers; and that something should now be done to preserve them, by drawing, and add them to the king's collection. As a further inducement, he informed him, that Mr. Aspenwall, his majesty's agent and consul-general at Algiers, had been recalled; that a merchant, of the name of Ford, who had been appointed to succeed him, was since dead; in consequence of which the place was vacant. He warmly advised Mr. Bruce to accept this opportunity of visiting Africa, under the protection of a public character; promised that he should have leave to appoint a vice-consul for the dispatch of business in his absence; and that, if he made wide excursions into the country, and large additions to the king's collection, he should be recompensed with the rewards stipulated in the affair of Ferrol, or advanced to a higher situation in the diplomatic department. To these proposals Mr. Bruce acceded. He afterwards had several conversations with lord Halifax and Mr. Wood on the subject of Africa. In the course of the conversation was frequently made of the sources

of the Nile, and of the obscurity in which they had ever been concealed. The fountains of the river of Egypt were spoken of as likely to remain wholly unknown to the moderns, until some undaunted adventurer should trace it to its origin. Hints were obliquely thrown out, that the discovery of these "coy sources" could not be expected from an ordinary traveller, much less from one who had no experience in those difficulties which must accompany an enterprise of such magnitude and glory; and it was insinuated, that if any Briton should fulfil the wishes of every age, in this particular, he ought not, under such a monarch, and in a period so auspicious to discovery and learning, to despair of a high reward."

The consulship at Algiers accordingly was given him. It appears from his own letters in the appendix, but not from the memoir, that he had accepted it because an attack upon Oran was projected, in which he hoped to have been of service. The fair promises of lord Halifax ended—as the promises of great men usually end. Not only was the promise which had been given him of a few months absence to visit the interior of the country never performed; but pressing dispatches upon the most urgent business, in which the property, and liberty, and life of British subjects were at stake, were neglected. As far as it was possible for an individual, Bruce defended the rights of his countrymen, and supported the honour of his country. If British property was confiscated, and British subjects dragged into slavery and scourged like slaves, the infamy does not lie at his door.

It was the plan of the Algerines to make the English pay them an annual tribute; for the many favours which they received from England, these ignorant barbarians attributed to fear—though not the true motive, quite as worthy and as wise as the true one. Bruce's advice, if followed, would have humbled their insolence for ever, and have preserved us a station in the Mediterranean. It is thus detailed in one of the letters to lord Halifax:

"My lord, affairs are come to this crisis: the Algerines have formed their plan, pursue it steadily, and have made all further expostulation impossible; and I humbly apprehend no alternative remains, but either by appearance of force, to shew them this scheme is impracticable, or put ourselves upon the footing of other nations.

"Nor is it the arrival of a fleet only that will have the effect to put his majesty's affairs upon a lasting footing of quiet. They will,

It is true, immediately make restitution, and desire a renewal of friendship, and if we are contented with that, the fleet will scarcely be disarmed, until they anew begin acts of violence, till constant equipments on our part, without any product but constant verbal submissions on theirs, will, they hope, in time, make us prefer a moderate annual expence to an excessive one so often as they please to provoke us to it. Therefore, my lord, I should humbly hope, besides restitution and reparation, that the expence of the armament might be insisted upon. They really are not in a condition for refusals. This, on our part, would be such a lasting mark of superiority, and, on theirs, so distinct a one of mal-administration, that no Dey, for the future, would hazard measures that might bring such serious consequences on his country. They are, my lord, very capable of affording this: in the treasury in Algiers only, there are said to be contained thirty-five millions sterling in specie, besides an immense amount in jewels and plate.

"But if it were his majesty's pleasure his royal highness should come hither with a fleet, there is a much more proper species of indemnification than that above mentioned, of more consequence to the nation in peace or war, which will much more readily be complied with by Algiers, and which is attended with certain circumstances in favour of liberty, that make it perfectly proper for the first expedition of a prince.

"This is the cession of the island of Tabarca to Britain, the subject of the memorial inclosed, wherein I have set down imperfectly the advantages attending the possession of it. It has been offered, by Algiers, to several powers, and they have differed upon small sums. It is of no sort of profit to the Algerines at present. The above your lordship may depend upon, as it is the result of many conversations with the commissary of Tabarca, now a slave here, and who is under obligations to me, though he knows not what use is to be made of his information.

Bruce had seen this island in a coasting voyage. It is famous for a coral fishery; and, along the coast, he says, are immense forests of large beautiful oaks, more than sufficient to supply the necessities of all the maritime powers in the Levant, if the quality of the wood be but equal to the size and beauty of the tree.

The whole correspondence is in the highest degree honourable to Bruce. He concludes one of his letters thus: 'My lord, in this country of murder, chains, and torture, your lordship will not expect me to be more explicit than I am as to measures.'

"I was just finishing the letter to your lordship, when word is brought me, that this morning early, the master of the above-mentioned vessel, and the supercargo, were car-

ried before the Dey, and in order to extort a confession if they had secreted any effects, were bastinadoed over the feet and loins in such a manner as the blood gushed out, and then loaded with heavy chains: the captain, it is thought, cannot recover. I have likewise received from a friend some insinuations, that I am in danger, and advice to fly; but as it was not the prospect of pay, or want of fortune, that induced me to accept of this employment, so I will not abandon it from fears or any motives unworthy a gentleman. One brother has this war already had the honour of dying in his majesty's service, two more are still in it, and all I hope is, if any accident befall me, as is hourly probable, his majesty will be favourable to the survivors of a family that has always served him faithfully."

It is impossible to read the correspondence without wishing the two men to change situations. Bruce would have taught the pirates a good lesson had he been in the ministry, and lord Halifax should have been sent to Algiers to teach him English feelings under Algerine discipline. Bruce was neglected in his public capacity, and ill-used as to his private concerns. The leave of absence was never granted him, and he was at last obliged either to make his excursion as a private individual, or to abandon the principal design of his residence in Barbary.

The history of this journey is given by himself in the introduction to his travels. From this time, therefore, till his return from Abyssinia to Europe, we may pass over the occurrences of his life. The first business in which he engaged after his complete recovery was of a very singular nature. Before he went to Algiers he had received a promise of marriage from a Scotch lady, settled, as we suppose, in Italy. As Bruce, however, thought proper to make an excursion to the sources of the Nile before he claimed the performance of this promise, the lady married an Italian nobleman, while he was drinking her health at Geesh. He thought himself injured, apparently with less reason than she had thought herself undervalued; and, in spite of the advice of his friends, he went to Rome to challenge the marquis. The affair terminated in the following correspondence:

"1. *Mr. Bruce to Sig. Accoramboni.*

"Sir,

"Not my heart, but the entreaties of my friends, made me offer you the alternative by the abbe Grant. It was not for such satisfaction, that I sick, and covered with wounds, I have traversed so much land and sea to find you.

"An innocent man, employed in the service of my country—without provocation or injury from me, you have deprived me of my honour, by violating all the most sacred rights before God and man; and you now refuse to commit to writing what you willingly confess in words. A man of honour and innocence, marquis, knows no such shifts as these; and it will be well for one of us to-day, if you had been as scrupulous in doing an injury as you are in repairing it.

"I am your equal, marquis, in every respect; and God alone can do me justice for the injury which you have done me. Full of innocence, and with a clear conscience, I commit my revenge to him, and draw my sword against you with confidence inspired by the reflection of having done my duty, and by a sense of the injustice and violence which I have suffered from you without any reason.

"At half past nine (French reckoning) I come to your gate in my carriage; if it does not please you, let your own be ready; and let us go together to determine which is the more easy, to injure a man in his absence, or to defend it when he is present."

"2. *Sign. Accoramboni to Mr. Bruce.*

"Sir, *Rome, Nov. 30, 1773.*

"When the marriage with Miss M., at present my wife, was arranged, it was never mentioned to me that there was a promise made to you, otherwise that connection should not have taken place.

"With regard to yourself, on my honour, I have never spoken of you in any manner, as you were entirely unknown to me. On which account, if I can serve you, command me. With the profoundest respect, I sign myself, your most obedient humble servant,

"FILIPPO ACCORAMBONI."

"To James Bruce, Esq.

On his return to England he presented his drawings to the king, for which, it is added in a note, he received a gratuity: we wish it had been specified what. The high reward, which had been held out to him by lord Halifax, was certainly never bestowed, though assuredly the services which he had rendered to literature deserved some marks of public honour, and public remuneration. In 1776 he married a second time: having been so long a widower, that the year of his first wife's death was that in which his second was born. With this lady he lived happily; but only for nine years, when he was again left single. He survived her nine years: his own death was remarkable. After having escaped from the barbarians of Abyssinia and Nubia, and the perils of

the desert, he fell down his own stairs and died; but it is probable that his fall was in consequence of a fit. He was in his 64th year.

The present edition contains his last corrections and emendations. As these are not pointed out, it cannot be expected that we should have collated so extensive a work; and had they been of any great importance, they would have been specified. Mr. Murray has added various appendices and notes. To the first book he has appended Balugani's description of the *cunya*, or boat of the Nile, and general observations on the early history of Arabia, Egypt, and Ethiopia, which tend to identify Sesostria with Shishak, and to prove that the Egyptians had made no conquests in Asia prior to the age of Solomon. The dissertation is erudite and ingenious, but the arguments would have been more forcible if more condensed. Here also he has inserted Bruce's letter to Dr. Burney on Egyptian and Abyssinian music, adding certain remarks of his own; a part of which we shall quote, relating to the drawings of the harpers from the caverns of Thebes.

"Mr. Brown, who lately travelled into Egypt, and Dar Fur, and visited the cavern in the Biban al Moluc, where Mr. Bruce drew these figures, has insinuated that he seemed to have drawn them from memory. This report has gained credit, and been repeated to the prejudice of Mr. Bruce's character, both in Britain and on the continent.* The facts, that may be brought to vindicate him, are the following:

"The penciled sketches of the two harps are still preserved among Mr. Bruce's papers, and one of them, at least, is clearly the work of Luigi Balugani. On one of them is a direction to the engraver, in Mr. Bruce's handwriting, giving him a slight liberty to finish the sketch, but not to change the costume of the player. This was written a short time before the publication of the travels; but it is quite evident to any eye that the difference between the engraving and the sketch is very trifling.

"From the known custom of Mr. Bruce and his assistant, it is next to certain that the sketches were taken on the spot. However careless Mr. Browne may suppose these gentlemen to have been at other times, it is not likely that they would have sitten down, after an excursion through the tombs of ancient Thebes, to draw, *from memory*, the sculptures they had seen in the course of the day. Mr. Browne does not pretend that he can draw; we may, therefore, ask him, if he had Mr. Bruce's drawings in the cave to compare

* Vide Larcher, Traduct. d'Herodote, vol. i. pref. p. xlv.

them with the originals? If he had not, his criticism is that of a man who is no artist, *making a remark from memory*. Whether Mr. Bruce could draw or not, is of little importance in deciding on the truth of these representations; for he had in his company an excellent draughtsman, whose works remain to speak for his pretensions."

M. Denon, who gives us a more perfect view of Egyptian antiquities than any work as yet in existence, confirms what Mr. Bruce has said on the subject of Egyptian music. That accomplished artist sketched seven figures, playing on instruments, from the walls of the royal sepulchres, west of Thebes, and from the temple of Tentyra.

The most important of these sculptures is that of a musician playing on a harp, having, according to M. Denon, twenty-one strings. The sketch which he gives nearly inclines us, at first, to believe, that it is one of those given by Mr. Bruce; yet, on examination, it differs in so many particulars as to leave no doubt that it is none of them. M. Denon's sketch is evidently hasty, but probably a good resemblance.

Denon has now confirmed the veracity of Bruce, who seems to have made no other alteration than that of improving the figures, a liberty to which a zealous artist might easily be seduced.

To the second book the editor has added a summary view of the Egyptian theology, as collected from the Hebrew and Greek writers, with the names of the gods in the antient native language, intended to illustrate the remains of Egyptian antiquity mentioned in the two preceding books. A dissertation, containing additional proofs in support of Bruce's hypothesis, that Egypt was peopled from the south, and the confines of Ethiopia; and a vocabulary of the Amharic, Falashan, Gafat, Agow, and Tcheretch Agow languages. To the third, he has prefixed a geographical account of the Abyssinian provinces, and a preface to the history of Abyssinia, containing a short view of the Abyssinian constitution, such as it appears to have been in the better days of the empire; an account of the ceremonies used at the coronation of the king, or neguz, as he should more properly be called; of the principal officers of state, and those peculiar customs of the court and camp, which should be understood before the history is perused. These very learned dissertations are compiled from Bruce's Ethiopic MSS. To this same

book he has appended miscellaneous notes and remarks on the MS. Abyssinian history, brought by Bruce from Gondar; and a vocabulary of the Galla language. The fourth book has neither preliminary matter nor appendix; but, in the course of this book, Mr. Murray has exercised a very unwarrantable exertion of editorial authority, having omitted the whole life of Bacuffa, as it stands in the former edition, and inserted one written by himself in a note. He says, indeed, that the life, as written by Bruce, may be found in a succeeding volume: we have not found it there. This total omission must be imputed to oversight; but the chapter ought not to have been displaced; it is highly curious, and the most curious anecdotes rest upon the authority of the wife of Bacuffa, the Iteghé, who herself communicated them to Bruce. Mr. Murray's additional matter might have appeared, as it now does, in a smaller type, and this have been retained. The work is imperfect without it, and indeed contains some allusions which are left absolutely unintelligible by the omission.

The fifth book also is without additions; but, after the sixth, we find additional accounts of the transactions at Gondar, and journey to the sources, containing a sketch of Michael Sukul's life, till the time when Bruce entered Abyssinia; extracts from Bruce's common-place book concerning his first introduction to the Ras, and from Balugani's journal; part of these last we have previously extracted. Here also he has inserted the descriptions of the sources by Pedro Paez and Jeronymo Lobo; the first as it stands in Kircher, part Latin, part unintelligible Portuguese; the latter in Le Grande's French, with translations of both, and remarks upon them. It is his opinion that Paez had visited the springs, but that Lobo only copied his account. After the last book, detached articles are added from the several journals and common-place books, containing additional information respecting Abyssinia, and extracts from the journals of the route homeward. The appendix is increased with eleven additional articles of natural history; an account of the antidotes used by the Nuba against serpents. Observations of latitude and longitude made by Bruce in Africa; dissertation on the progressive geography of the Bahar el Abiad, and the other branches of the Nile; account of the Ethiopic MSS. from which Bruce composed the history of Abyssinia; ac-

count of the price of writing-books at Gondar, and a description of some of the most valuable works in Bruce's collection of Arabic MSS. The volume of prints contains all the additional articles of natural history, and portraits of Ozoro Esther, Tecla Mariam, Kefla Yasous, and Woodage Asahel.

It would be poor and inadequate praise to say, that it has seldom or never fallen to our lot to notice a book so ably edited. We believe no editor ever before so laboriously qualified himself for his undertaking. It is to be hoped that Mr. Murray will make farther and greater use of

the very rare, and very difficult erudition which he has acquired. We wish for the book of Enoch, however extravagant it may be; and for a literal version of the Abyssinian chronicles, however opposite to our notions of historical composition. Bruce says that he has made his narration from these, more conformable to the manner of writing English history; this is precisely the very thing which he should not have done. If I am to feed upon lion's flesh, don't let it be drest like roast mutton; I would have it in the genuine cookery of the Welled Sidi Booggannim.

ART. II. *A Voyage round the World in the Years 1800, 1801, 1802, 1803 and 1804: in which the Author visited the principal Islands in the Pacific Ocean, and the English Settlements of Port Jackson, and Norfolk Island.* By JOHN TURNBULL. 3 Vols. foolscap 8vo.

IF every man whose business or amusement leads him into Wales or Scotland flatters himself that he is qualified to impart some interesting information to the public, to present some novel view of human society, some unnoticed trait of character, it can excite no surprise that he whose enterprising spirit has led him to circumnavigate the globe, should, on his return, feel so fully fraught with matter of high import and curiosity as to seize with avidity on the press, as the only sufficient conductor for discharging the contents of his o'erburdened brain. Repeated experience, indeed, has evinced, that it is not absolutely necessary to freight a vessel with *savans* in order to have such an account of a voyage as may repay the time and task of perusal: the plain and unassuming journal of a man of sense and observation, faithfully kept, will hardly fail to interest and inform. For many of our best books in this department of literature we are indebted to merchants and missionaries. Among the number of our *best books*, indeed, the present narrative has no chance or claim to be ranked; such as it is, we owe it to an adventurer whose voyage was undertaken for the advancement of trade, not of science, and, like most others, for purposes of private emolument rather than of public advantage.

Whilst second officer in the *Barwell*, in her last voyage to China, in the year 1799, Mr. Turnbull and the first officer of that ship had reason to believe that the Americans carried on a very lucrative trade to the north-west of that continent.

On their return to England they communicated the result of their observation to some merchants of an enterprising spirit, who approved of the proposed speculation, and immediately prepared for its execution. The command of the vessel was given to the captain of the *Barwell*, and the cargo and trading part were entrusted to Mr. Turnbull; both these gentlemen were interested in the success of the voyage, as they held shares of considerable value.

From Portsmouth we sail to St. Salvador in about six pages. It is perhaps a memorandum worth preserving, that whilst the Spaniards in the harbour were lading and unlading as deliberately, and as much at their ease, according to Mr. Turnbull, as if they had been in Cadiz itself, the most minute and jealous examination of the English vessel was insisted on by the viceroy; various circumstances indicated that the Spaniards were on very favoured terms with the Portuguese, and indeed that a clandestine intercourse between the two powers existed at that time, prejudicial to the interests of Great Britain, and consequently unsanctioned by the terms of a fair neutrality. Mr. T., however, gives the Portuguese a Rowland for their Oliver; he suggests the impossibility that a nation fallen so low in the scale of European powers should long possess the Brazils, and monopolize an extent of country which she is as little able to use as to defend; of course, if it falls into any hands, it had better be enjoyed by us than the French, who would be likely enough to seize upon them if an

opportunity occurred, and console themselves in South America for the loss of Malta.

From the Brasils our adventurers steered their course to the Cape of Good Hope, where they stayed a fortnight, and thence proceeded to Port Jackson in New South Wales, where Mr. Turnbull remained, in order to dispose of his cargo, whilst the captain proceeded on his north-west speculation. The admirable account of New South Wales, by captain Collins, has anticipated, in all its particulars, the information concerning it in this meagre narrative. Mr. Turnbull paid two visits to the colony, and laments, not without reason, the disinclination which at both times he found prevailing among the officers of government. Numerous indeed are the obstacles which seem to oppose themselves against the improvement of the colony; nor, perhaps, is it a matter of much consequence, so far as the interests of the mother country are concerned. The vast expence with which the establishment of it has been attended, ought, no doubt, to ensure a compensation at some distant period: a parent never expends his money with less reluctance than in the education of his son: he hopes to qualify him for earning his own subsistence, and for adding to the wealth or honour of his family. But a colony—a colony too of convicts! is it likely to thrive? And if it should, is the thrift of the offspring connected with the interests of the sire? where is the bond of unity and concord? Whenever the colony is able to support itself it will, in all probability, assert its independence: the aid of other countries in support of its exertions will be called for without scruple, and granted without reluctance. This, no doubt, is a remote period to contemplate: the climate, indeed, notwithstanding its severe heat, is salubrious, and when the country is cleared of its woods there will be a large extent of fertile soil. The character, however, of the persons who are transplanted thither leaves but little hope that they will advance the interests of the colony by their industry, their morals, or their understanding; and some of the regulations which, with the best intentions, the government has adopted, appear to be in the highest degree impolitic and prejudicial. We allude to the limitation of the price of labour, of profits upon the sale of imported articles, and to the regulation concerning the price of provisions. These absurd restrictions, however, call forth warm eulogiums from

Mr. Turnbull on the wisdom and benevolence of the government! The markets at Port Jackson having, unfortunately for Mr. Turnbull, been just supplied, and the little money of the colony exhausted, he proceeded to the settlement of Norfolk Island, where he had again the misfortune to have been recently anticipated. Here he remained ten months, and as an excuse for saying little or nothing about it, pleads that he visited the island as a trader, and not as a natural philosopher! The general statement which many of our readers will remember to have seen in governor Phillip's Voyage to Botany Bay, &c. concerning the beauty of the country, and the exhaustless fertility of the soil, is confirmed by Mr. Turnbull. The productions which, according to the governor, were of the greatest importance to Norfolk Island, are the flax plant and the pine: the former, though luxuriant in its growth, and estimable for the purpose of making cordage, sail-cloth, &c. does not appear to be a native of the island. Pines grow to an enormous size; they often rise to eighty feet without a branch; governor Phillip says they are sometimes nine or ten feet in diameter at the bottom of the trunk, and frequently measure one hundred and sixty or one hundred and eighty feet in height. The fern tree (according to the same author, for we obtain marvellous little from Mr. Turnbull) measures from seventy to eighty feet, and affords excellent food for sheep and other small cattle. The turpentine obtained from the pine is remarkable for purity and whiteness, and governor Phillip, understanding that the wood was of excellent quality, and light as the Norway timber, thought that it promised a valuable supply of masts and spars for our navy in the East Indies. He seems, however, to have been mistaken; Mr. Turnbull says that the pine of Norfolk Island is very brittle, and only fit for purposes of building, household furniture, &c. The pine of the South Sea, and indeed of all warmer climates, he says, is of a very different nature from those of Europe. We have no doubt of this: nature is uniform in her operations: throughout the vegetable kingdom rapidity of growth seems to be incompatible with solidity of substance.

Norfolk island was colonized by governor Phillip, who sent thither the most profligate part of his profligate people: "it has henceforth been adopted as the ordinary practice, that the more abandoned of the convicts, and such as have fallen

under the sentence of the law a second time, should be transported to this island." Among the most respectable of the settlers are some part of the crew of the *Sirius*, who, being shipwrecked on the island, preferred the cultivation of so fertile a country to a return home; several marines who went out upon the first establishment had the same indulgence, as also have some of the more industrious convicts. We are glad to learn that the culture of the sugar cane is highly encouraged; many of the smaller plantations are fenced round with it. Norfolk Island, however, as a place of establishment for a colony, has the insuperable objection against it of being almost wholly surrounded by a reef, and barricaded, as it were, against all approach, by a heavy mountainous sea; of being destitute of a harbour; and having a bad shore, the bottom being covered with pointed fragments of sharp coral rock, which renders anchorage impracticable. Government has attempted in vain to remove these obstacles.

The following anecdote will not be read without interest, or without exciting feelings of compassion towards the unfortunate outcast: it occurred in the island about eight years since:

"One of the prisoners belonging to the outgangs, being sent into camp on Saturday, to draw the weekly allowance of provision for his mess, fell unfortunately into the company of a party of convicts, who were playing cards for their allowance, a thing very frequent amongst them. With as little resolution as his superiors in similar situations, after being a while a looker-on, he at length suffered himself to be persuaded to take a hand; and in the event, lost not only his own portion, but that of the whole mess. Being a man of a timid nature, his misfortune overcame his reason, and conceiving his situation amongst his messmates insupportable, he formed and executed the extravagant resolution of absconding into the glens.

"Every possible enquiry was now made after him; it was known that he had drawn the allowance of his mess, and almost in the same moment discovered that he had lost it at play; search upon search however was made to no purpose. However, as it was impossible that he could subsist without occasionally marauding, it was believed that he must shortly be taken in his predatory excursions. These expectations, however, were in vain, for the fellow managed his business with such dexterity, keeping closely within his retreat during the day, and marauding for his subsistence only by night, that in despite of the narrow compass of the island, he eluded all search. His nocturnal depredations were solely confined

to the supply of his necessities; Indian corn, potatoes, pumpkins, and melons. He seldom visited the same place a second time; but shifting from place to place, always contrived to make his escape almost before the theft was discovered, or the depredator suspected. In vain was a reward offered for his apprehension, and year after year every possible search instituted; at times it was considered that he was dead, till the revival of the old trade proved that the dextrous and invisible thief still existed.

"In the pursuit of him, his pursuers have often been so near him, that he has not unfrequently heard their wishes that they might be so fortunate as to fall in with him. The reward being promised in spirits, a temptation to which many would have sacrificed their brother, excited almost the whole island to join in the pursuit; and even those whose respectability set them above any pecuniary compensation, were animated with a desire of hunting in so extraordinary a chase. These circumstances concurred to aggravate the terror of the unhappy fugitive, as from his repeated depredations he indulged no hope of pardon.

"Nothing of this kind, however, was intended; it was humanely thought that he had already sustained sufficient punishment for his original crime, and that his subsequent depredations, being solely confined to necessary food, were venial, and rendered him a subject rather of pity than of criminal infliction. Of these resolutions, however, he knew nothing, and therefore his terror continued.

"Chance, however, at length accomplished what had baffled every fixed design. One morning about break of day, a man going to his labour observed a fellow hastily crossing the road; he was instantly struck with the idea that this must be the man, the object of such general pursuit. Animated with this belief, he exerted his utmost efforts to seize him, and, after a vigorous opposition on the part of the poor fugitive, finally succeeded in his design. It was to no purpose to assure the affrighted wretch that his life was safe, and that his apprehension was only sought to relieve him from a life more suited to a beast than a human creature.

"The news of this apprehension flew through the island, and every one was more curious than another to gain a sight of this phenomenon, who for upwards of five years had so effectually secluded himself from all human society. Upon being brought into the camp, and the presence of the governor, never did condemned malefactor feel more acutely; he appeared to imagine that the moment of his execution approached, and, trembling in every joint, seemed to turn his eyes in search of the executioner. His person was such as may well be conceived from his long seclusion from human society; his beard had never been shaved from the moment of his first disappearance; he was clothed in some rags he had picked up by the way, in some of his nocturnal peregrinations, and

even his own language was at first unutterable and unintelligible by him.

"After some previous questions, as to what had induced him to form such a resolution, and by what means he had so long subsisted, the governor gave him his pardon, and restored him to society, of which he afterwards became a very useful member."

While Mr. Turnbull was at Norfolk Island he received a letter from his captain, announcing the total failure of the north-western speculation, and his return to Port Jackson: it was resolved to try Bass's Straits, and endeavour to make up a cargo of skins there, as the licence from the East India Company compelled the vessel to visit China. The captain, in order to expedite this business, engaged some supernumerary hands, whom, together with an officer "well versed in the sealing business," he landed on King's Island in those straits, whilst he proceeded with the ship to the Society Islands, in order to supply her with provisions, *which could not be purchased at Port Jackson at any price!* On their arrival at Otaheite, however, they learned from some missionaries who are settled there, that the ravages of a destructive war, which was just terminated, had created a dearth in the island. After remaining there about a month, however, they obtained a small supply of hogs, &c. and proceeded to Ulietea, touching at Huaheine, where they were greeted by an old shipmate who had for some time resided on the island, and seemed perfectly satisfied with his situation! In this island the natives entertained them with a dance.

"The performers and their attendants came off in procession, in a large double canoe, having a platform or stage erected across the forepart, on which the dancers and musicians sat. This canoe was accompanied by a great number of small canoes, filled with natives to behold the entertainment prepared for the strangers. The women were dressed in a sort of long bell hooped petticoat of their own cloth, ornamented with a purple border. What answered the purpose of a hoop was a couple of stuffed pads bound round the waist to support and distend the petticoat; round the body was wrapped a large quantity of cloth, fastened with bandages; and opposite to each breast was placed a bunch of black feathers. They wore also a kind of turban adorned with a variety of flowers. A master of the ceremonies presided in the dance, and directed all the movements, which were not always of the most delicate nature. The music consisted of two drums made from a log of wood hollowed out in a cylindrical shape, and covered at the end with a piece of shark skin, tightly braced down the side. The

musicians make no use of drum-sticks, but employ their fingers, and sometimes their hands, so as to be heard at a considerable distance. They beat slowly at first, as a signal to prepare for the dance; and as the music becomes more rapid, the dancers quicken their motions. Flutes also were used on the occasion, having only three holes or stops, one of which is of such a size as to admit of the performer's applying his nostrils to fill it. The dance required very great exertion in the women to keep time to the music by expiring and inspiring their breaths, drawing their mouths in contrary directions, and twirling their arms and fingers with some order and great regularity. Those who excelled in these contortions and gestures were the most applauded. So eager were the performers to gain the approbation of the spectators, and so violent were their exertions, overloaded with clothing and straitened with bandages, that many of them seemed at length ready to sink under the violence of their efforts. The director of the dance exerted himself to encourage them to a further continuance of their labour, which to us appeared a kind of cruelty; and induced us at length to interfere, apparently much to the satisfaction of the performers. Our people were so much pleased with this entertainment, that they applied to me for some articles to bestow on the ladies who had worked so severely for their amusement. Goods of different sorts, to the value of three pounds, were accordingly furnished, and instantly distributed amongst the actresses; and thus an acquaintance was mutually formed, which in some instances grew into a close intimacy.

"During this exhibition, some of the men were amusing themselves by a sport of their own; three of them getting into a vessel formed like a wooden dish made use of at great feastings, their weight sinking it in the water to within an inch of the brim. In this situation they whirled it round and round, by means of their paddles, with incredible velocity, till they fell into the water, when they again renewed the sport, to the no small amusement of the by-standers."

A savage who is brought from his native woods into a civilized country, there clothed and fed, and anticipated in all his wants, feels, after a time, his restlessness revive, and impatient of restraint, to which he has been unaccustomed, sighs for the society of his sable brethren; he is anxious to participate in the dangers of the chase, the vicissitudes of war, and the barbarities of victory. An additional motive too, for returning among his countrymen, is the pride of shewing the trinkets he has obtained, and of enjoying the rank and estimation he is likely to derive from them. But it is hardly credible that a man who has once tasted the sweets of civilized life should voluntarily degrade him-

self into the character of a savage: and yet this has often happened. Several Europeans are scattered among the South Sea islands. The facilities of subsistence, arising from a soil of the highest fertility, exemption from labour even to indolence, and unrestricted intercourse with the female sex, these are the allurements which a sailor, after the fatigues of a long voyage, is not always able to resist. The natives, crafty and insinuating, take every opportunity to seduce the sailors: sensible of the superiority of European skill, they are eager to obtain their assistance in battle, and their instructions in the make and use of domestic implements. It has of late also been customary to permit convicts from Botany Bay to assist in navigating vessels bound thither: these people seldom fail to avail themselves of the opportunity to escape, and afford no slight ground for the apprehension of Mr. Turnbull, that in no great length of time the South Sea islands may become nests of plunderers and pirates.

At Ulitea our adventurers found an Englishman of the name of Pulpit, who brought with him his wife, as he called her, an Otaheitan girl of about fourteen or fifteen. The moment the poor fellow got upon deck he returned thanks to heaven, in the most fervent and impressive manner, that he had escaped out of the hands of the most savage murderers. It seems that he had been landed in Huaheine by the brig *Venus*: and in return for his voluntary service on board that ship he had been supplied with such articles as would be useful to him on the island. Among these was a musket and double-barrelled gun, which were objects of such eagerness to the natives, that in order to procure them they resolved upon his murder. This horrible project was discovered to him by the Otaheitan girl, who faithfully assisted her lover in his attempts to elude the attack of his murderers. Pulpit, however, was at last surprized by a party of natives, and led away as a sacrifice to some of their divinities: they disputed among themselves concerning the treatment he was to receive, and his life was spared by the authority of an elderly woman of rank, on condition that he should give up his various implements and arms, and repair some muskets belonging to the natives. Pulpit made his escape to Ulitea, but he assured his deliverers that the inhabitants here had the same character of dissimulation, treachery, and ferocity with the people of Huaheine. The event proved the truth

of his assertion: on the night before the intended departure of the vessel from Ulitea, it was discovered that four of the crew had deserted; three of these were Botany Bay convicts, who had been taken on board to work the ship, under an engagement that they should be returned to Port Jackson. These fellows had concerted with the Uliteans to cut the vessel from her anchors, and when she should be driven ashore, to plunder her of her small arms and ammunition, and murder the crew. As soon as this desertion was discovered, Mr. Turnbull, with a degree of courage bordering on temerity, went singly on shore at two o'clock in the morning, and requested of the king (who had been a constant visitor on board the ship) to exert his utmost authority in restoring the men. The king affected the greatest surprise, and declared that they certainly had not landed, although it was afterwards known that half an hour before they had passed by his house. In a short time the situation of Mr. Turnbull became extremely critical: he felt himself surrounded by an hundred islanders, who were sagacious enough to know that if they had come to an open rupture and murdered him on the spot, it would have defeated the object they had in view; and who, on the other hand, were sufficiently aware of their own relative superiority at the time, to make their own terms for the restoration of the deserters, who, at last it was acknowledged, were concealed in a house but a little way up the country. These terms were the immediate gift of a musket and the promise of more fire-arms. Mr. T. returned to his ship, doubtless not without self-congratulation on his escape: some of the crew, however, had been tainted, and it was necessary to inflict summary punishment on two of the ringleaders. On the following night Mr. T. was roused from his sleep by an alarm that the ship was on shore: it was dark; but on sounding, twelve fathoms of water were found, and there was no sensible motion of the ship or of the water. On examining the cables, Mr. T. found them both lying slack on the deck; and the seamen being commanded to haul them up, the first pull brought the ends of both of them on board! They had been cut, and with the slightest breeze from sea the vessel would have been drifted on shore; indeed the natives had contrived to fasten a long and stout rope to the rudder, five or six feet under water, with which they had intended to draw the ship on shore.

This timely discovery enabled the captain, by clearing away another anchor with an iron stock, to haul the vessel seven or eight fathoms off from the reef. The natives had all this time preserved the profoundest silence, in momentary expectation of the bulging of the vessel: when they found their desperate plans detected they became perfectly outrageous, begun a furious assault with stones, and kept up, during the greater part of the following day, a discharge from fourteen muskets, which they had among them, and which did great damage to the rigging, boardings, nettings, and boats. The discharge of small arms from the ship, far from intimidating the natives, made them more outrageous: fortunately the horrid menaces which they held out of flaying and roasting alive any who should fall into their hands, restored loyalty and unanimity among the crew. Two of the deserters were seen instigating the natives with the greatest activity. Several attempts were made to recover the lost anchors, but in vain: the natives kept up so well-directed a fire that it was impossible. In the course of the day they made repeated exertions to gain the prize they had so treacherously laid a snare for, and it was necessary to employ the large guns against them in order to defeat the purpose. These had the desired effect, and the ship, in the darkness of the following night, got under sail and escaped from her perilous situation.

From the Society Islands our adventures proceeded, with some Otaheitans whom they had taken on board, to the Sandwich Islands: the first land they made was Wahoo, where, notwithstanding the example of treachery and ferociousness displayed by the Ulietans, the ship-carpenter deserted, and it was thought advisable not to go on shore for the recovery even of so necessary an artificer, lest more of the crew should follow his example!

According to Mr. Turnbull, the inhabitants of the Sandwich Isles are astonishingly more advanced in civilization than those of the Society Islands: these latter, indeed, have made no perceptible progress since the time of captain Cook. Like all savages—would that the remark were limited to savages in its application—their avidity for intoxicating substances is excessive: some Europeans planted the vine in Otaheite, and explained its future utility if allowed to remain unmolested. The avidity of the natives broke through all

restraint, and the grapes were plucked off before they were ripe. Not relishing the fruit equally with their own *ava*, they imagined that the spirit was in the root, and endeavoured to extract it by mastication, (the nauseating process which is employed on the *ava* root); finding their efforts unsuccessful, they revenged their disappointment by treading it under foot.

Mr. Turnbull suggests that the labours of the Missionaries would be far more successful among the Sandwich Islands than they are likely to be at Otaheite or Tongataboo: here they could have the advantage, support, and influence from several Europeans, and of a sovereign, *Tamahama*, the great chief of the Sandwich Islands, a man of insatiable ambition, and very uncommon genius. In a short space of time he will, without doubt, make himself master of every island: he was now on the point of invading Attowaie, an island to the leeward, whither our voyagers proceeded for a supply of salt and yams. The king of Attowaie had acquired so much knowledge of our language from some Englishmen who had followed his fortunes, that he was able to understand and answer any plain question which was put to him: the natives of Otaheite, although they have had still greater opportunities of hearing the English language, scarcely pronounce the proper names of those persons with whom they are most familiarly acquainted. The king of Attowaie professed a high regard for the British nation, and, as a proof of it, had taken to himself the name of King George, and to his children, who are numerous, he had given those of the royal family of England, beginning with the Prince of Wales, &c.

“This unhappy man, who, from every thing we saw and heard, is well deserving of a better fate, had already suffered so much from the ambition and power of *Tamahama*, that he was now about to adopt one of the most extravagant resolutions that can be conceived.

“The Europeans who had attached themselves to his fortunes, some of whom were carpenters, blacksmiths, &c. were now with their offspring a numerous body. As their last resource, they were constructing a vessel suited to the attempt of a long voyage, and in the event of the expected invasion, they proposed to escape from the island, and seek a refuge from the cruelty of their enemy in some one of the islands which they have heard are interspersed in the main sea. They are wholly ignorant of the method of measuring a ship's course, or of the other necessary branches of navigation. A compass, indeed, they possess. Their intention in the first place, is, to steer

to the westward, in the hope of reaching some part of the coast of China; or, by keeping their wind to the southward, to fall in with Otaheite, or some other of the Society Islands."

After having obtained provisions and salt, our voyagers left the Leeward Islands, and arrived at Owhyhee: here they received a visit from Mr. Young, who, with Mr. Davis and captain Stewart, had followed the fortunes of Tamahama for fourteen years. It appears that this ambitious chieftain has profited to the utmost by the instruction and assistance given him by captain Vancouver. The islanders under his dominion make frequent trading voyages to the north-west coast of America, and it is the intention of Tamahama to open a trade with China in vessels of their own construction, and to be navigated by their own people. The progress of the Sandwich islanders in the mechanical arts, according to Mr. Young's* account to Mr. Turnbull, has been astonishingly rapid: his royal residence at Mouie is said to be built after the European style, of brick, and with glazed windows, by European and American artificers, of whom he has a great variety.

"It was only in 1792 that captain Vancouver laid down the keel of Tamahama's first vessel, or rather craft; but so assiduously has he applied himself to effect his grand and favourite object, the establishment of a naval force, that at the period of our arrival he had upwards of twenty vessels of different sizes, from twenty-five to fifty tons; some of them were even copper-bottomed.

"He was, however, at this time much in want of naval stores; and, to have his navy quickly placed on a respectable footing, would pay well for them. He has also a certain number of body-guards to attend him, independently of the number of chiefs who are required to accompany him on all his journeys and expeditions."

A marine force of such strength, and so rapidly created, has given him an astonishing superiority over his neighbours: he now sends his warriors into distant parts, employs some of his small vessels as transports, and his larger ones as men of war, which are occasionally mounted with a few light guns. Tamahama's body-guards go regularly on duty, and relieve each other as in Europe, calling out *all is well* every half hour: their uniform is a blue

great-coat with yellow facings. Mr. Turnbull has forgotten to inform us of the nature of the traffic which takes place between the north-west parts of America and the Sandwich Islands: he prepares himself, however, with an answer to the very natural enquiry as to the possible nature of the commerce which can be carried on between these latter and the Chinese; he says that they are able to furnish fire-arms, gun-powder, hardware, and cloth of different sorts. A *superabundance* of these Tamahama is represented to have obtained from Europeans and Americans, in exchange for labour and refreshments supplied to the shipping who have touched there. This statement, we fear, will not obtain very general credit without further confirmation. Besides these articles of foreign introduction, the Sandwich islanders possess the sandal wood and pearl oyster-shell, of native produce.

Having accomplished the object of their visit to the Sandwich Islands, that of laying in a stock of salt, our navigators returned to Otaheite: in their course they fell in with several low islands, on some of which they landed, and had reason to believe, from the shyness of the natives, and their indifference to the proffered trinkets and tools, that they had never before been visited by Europeans. For the situation of these islands we are referred to Arrow-smith's map, although Mr. Turnbull has neither given us the name of them, their longitude nor their latitude. So much for his contributions to the advancement of maritime discovery!

During the absence of the *Margaret*† the ship *Nautilus* had visited Otaheite, and taken away all the hogs she could procure: it was agreed, therefore, that the captain should proceed to some of the windward islands for a supply, whilst Mr. Turnbull, with a few assistants, remained at Otaheite on the salting business. She was expected to be about three weeks: at the expiration of two months the crew reached the island in a punt made from her wreck. Thus fatally terminated all the hopes of the voyage!

The accounts of Otaheite and the Society Islands given by the Missionaries in the transactions of their society, are by far the most valuable of any that we have:

* Mr. Young, from whom most of the particulars respecting Tamahama were obtained, is said, by Mr. Turnbull, to be "a man of strict veracity."

† It is singular enough that we do not even learn the name of the ship in which this voyage is made, till the wreck of the *Margaret* is related at the latter end of the second volume. The name of the captain is not once mentioned.

their manners, customs, superstitions, and idolatries, are there detailed with more minuteness than in any other work. The opportunities of obtaining information on these subjects during his residence at Otaheite by Mr. Turnbull, were considerable, but we find little which has not been anticipated by the relation of the Missionaries. This account indeed seems later than the last of theirs, and the *political events* of the island, to use a term of appropriate dignity, are brought lower down. The war which the Missionaries represented as being on the eve of taking place between the young king Otoo and the Attahoorians for the image of their god, Oro, had just terminated in favour of the latter when our voyagers first landed there, and was the cause of the dearth which then visited the island. This war was not entirely of a religious nature, but seems to have been fomented, if it did not originate in the domineering and oppressive character of the royal family, and particularly of Otoo himself.

The father of Otoo, the regent Pomarre, died suddenly at the time Mr. Turnbull was at Otaheite: he considered this event as likely to be attended with serious inconveniences to the Missionaries, to whom he was ever a firm friend. Many of the natives imputed his death to the prayers of the Missionaries: indeed it is a very prevalent, and most unfortunate belief among the Otaheitan, that whatever calamity befalls is effected by their witchcraft. They are convinced too, that a great part of their plagues and diseases proceed immediately from the shipping. In the present instance, however, there was a diversity of opinion, which, it may be hoped, the Missionaries would turn to a good account. Many attributed the sudden decease of Pomarre to some offences he had committed, and they agreed that this must have been the frequency of his human sacrifices. In order therefore to propitiate their offended divinities, the body of a human victim which he had sacrificed about three weeks before, was brought and stretched prostrate before his corpse. The Missionaries would, no doubt, endeavour to avert from themselves the suspicion of instrumentality in his death, and press the abolition of so horrible a custom. Mr. Turnbull asserts that it is abhorred by the common people, and only supported by the chiefs: Pomarre was himself a high priest, and obtained great influence among them by his zeal for the gods. Infanticide prevails as

much as ever, and the population of the island is diminishing with great rapidity. Captain Cook no doubt overstated it at two hundred thousand: on the arrival of the Duff in 1797 it was fifteen thousand: at this time (1803) it does not exceed five thousand souls. The doctrine of fatality is carried to such excess, that every disease is believed to be a punishment from their offended deities, wrought, perhaps, by the magic of the Missionaries, or by shipping which touch at the island. In this latter superstition they have had, alas, but too strong reason to repose! The consequence of this doctrine is, that diseases are considered as remediless, and the use of medicine is rejected.

The Missionaries, although their pious but ill-directed labours have been thrown away, are pretty well satisfied with their situation: their zeal is yet unabated: they twice made the circuit during Mr. Turnbull's stay, preaching from district to district, and seconding their exhortations with presents. *Some of them expressed a wish that some decent young women of character might be sent over to Otaheite as wives for them.* They were building two boats from eighteen to twenty tons, for the purpose of visiting the islands to the leeward: they had it also in contemplation upon the arrival of the next missionary ships to retreat to the isthmus, as their chief subsistence; the fruit of the bread tree is becoming scarce at Matavai.

The propagation of the Christian faith still goes on very slowly:

"One Sunday evening, Mr. Jefferson requested permission to exhort Otoo and Terinavoura, with all their followers; Otoo sent a messenger to me on the occasion, saying that he wished to see me: I accordingly went, and found Mr. Scott and Mr. Jefferson in the act of exhortation. Their congregation might amount to about fifty. Upon its conclusion, I demanded of Otoo what he wanted with me. He asked me, upon the departure of the Missionaries, whether it was all true, as they preached: I replied in the affirmative, that it was strictly so according to my own belief, and that of all the wiser and better part of my countrymen. He demanded of me where Jehovah lived; I pointed to the heavens. He said he did not believe it. His brother was, if possible, still worse. Edeah was looking on, with a kind of haughty and disdainful indifference. It was all *havery* or falsehood, adding, they would not believe unless they could see; and observed, we could bring down the sun and moon by means of our quadrant, why could we not bring down our Saviour by similar means?"

The Missionaries tell them that the god

of Britain is the god of Otaheite and the whole earth, and that it is from this Being that they receive their hogs, bread, fruit, and cocoa-nut. This the Otaheitans flatly deny: alleging that they possessed all these articles long before they had heard of the god of Great Britain.

After the loss of the Margaret the situation of our adventurers at Otaheite became exceedingly distressing: they had

lost their carpenter at the Sandwich Islands; their influence with the natives became weakened, and the crew dispersed. Having remained in this situation three months, they were relieved by a vessel which touched at the island, and took them to Port Jackson. Here they resided a second time till the Calcutta brought them once again to the shores of Britain.

ART. III. *An Historical Account of the Voyages of Captain James Cook, to the Southern and Northern Hemispheres.* By WILLIAM MAVOR, L. L. D. 12mo. 2 Vols. pp. 656.

THE public is very well acquainted with Dr. Mavor's pentagraphic powers: children may read these volumes with in-

struction and amusement, who would be unfit to engage in the original work.

ART. IV. *A Description of Prince of Wales Island, in the Straights of Malacca: with its real and probable Advantages and Sources to recommend it as a Marine Establishment.* By SIR HOME POPHAM, Knight of the Sovereign Order of St. John of Jerusalem, Captain in the Royal Navy, and Fellow of the Royal Society. 8vo. pp. 82.

THE propriety or impropriety of expending a large sum of public money on the construction of moles, docks, quays, arsenals, and the other appurtenances of a marine establishment in Prince of Wales island, cannot here be justly appreciated without the aid of a counter-memorial drawn up on the spot by an accomplished surveyor. Sir Home Popham pleads for the establishment with specious and plausible reasoning.

"But an advantage which Prince of Wales Island possesses beyond any other part of the eastern coast, is the excellence of its harbour. The whole space from the north-east point of the island to Pulo Jeraja, bounded on the east by the coast of Queda and Praya Sand, may be considered as a very safe harbour, and capable of containing all the navy of England: the present anchoring place is near the Fort Point, to the northward, for large ships, and to the southward for smaller ones, where they lie in from five to thirteen fathoms, and so perfectly smooth in all winds, and at all times, that I never heard of an instance of the smallest boat not being able to pull off to the weathermost ship. I had apprehended, on my first going to the island, that the north-west wind would have forced in a heavy swell; but as it frequently blew from that quarter, I concluded the mud flat, from the north point of the island to the Queda shore, on which is only four fathoms and a half at low water, served as a bar, constituting the whole harbour a complete basin.

"The island abounds in several kinds of deer and wild hog; and it is remarked that the wild hog is of a very delicate flavour, and particularly good.

"The coast of Queda produces great numbers of cattle; and as many as may be wanted can be obtained, whenever there is a sufficiency of pasturage. They have for some years salted beef in Bengal, with much success. A similar attempt may be made here, for the climate in the upper part of the country is nearly as cold as at Calcutta. If the experiment should succeed, beef and pork can be cured as cheap as in England, and the ships served with it always in less than three months salting. Bakeries may also be established for the supply of biscuit; and there appears to be no difficulty in making both ruin and arrack, purer and cheaper than what is now served to his Majesty's fleet. Rice grows here; and I imagine the sugar-cane* would thrive as well as in any other parts of India, which, by being cultivated, would increase the revenue, and add to the export to Europe."

This pamphlet would have been more intelligible and complete if accompanied with a map of the island in question, which was formerly and more discriminately called Pulo Pinang; and with a chart of the contiguous sea, which might have been copied on a reduced scale from that published for Laurie and Whittle, after the original Calcutta chart.

In 1785 Mr. Lacam suggested to a committee of the house of commons the

* The sugar-cane grows to a prodigious size, both in this island and on the coast of Queda.

expediency of a marine establishment in the eastern part of our Indian possessions. He fixed on New Harbour, in the river Hoogly, as the fittest place of structure: but whatever use commerce might be able to make of that site, it seems ill adapted for belligerent vessels.

If this island, which is well situate to collect the produce of the Indian archipelago, be wholly exempted from the jurisdiction of the company, and not comprehended within the withering ban of its charter, it will speedily become another Onnuz' for traffic, wealth, and population. This advantage attends a new settlement in the east, that labour is cheap, and the supply of a population familiar with the arts of luxurious life is easy; so that, in the course of a single generation, all the parts of a flourishing and polished society can be put together, and a city can rise like an exhalation.

There is perhaps no episode in our history more truly honourable to the general character of our people and our protection than the fortunes of Pulo Penang. In August 1786 there were tombs on the island, but no man: it had been a haunt of pirates and banditti, whom the king of Queddah had thought it necessary utterly to extirpate. The empty wilderness was purchased of this sovereign for a perpetual rent of six thousand dollars. In five years time George-town was so much of a sea-port, and the resort of prowls so considerable that the king of Queddah complained his continental custom-houses no longer yielded any revenue, and armed to attack the new settlement. The inva-

sion was repelled; but an additional quit-rent was granted to the king of Queddah; and the most entire cordiality was restored. In the year 1800, that is in the short space of fourteen years, the population consisted of ten thousand three hundred and ten persons, of whom seven hundred and twenty-three were land-owners, and one thousand two hundred and twenty-two were slaves. The country is already pierced by roads bordered with alleys of young spice-trees: to pensile bridges of bamboo have succeeded in five places bold arches of brick and mortar. The cajan huts of the first settlers are giving place to durable houses and rectangular streets. Aqueducts and hospitals, custom-houses and jails, are already towering into conspicuity. Vessels of eight hundred tons have been built and launched by the inhabitants, pepper-vines and beetle-nut trees afford important objects of exportation. The revenue amounts to eighty thousand dollars, and the annual arrival of ships to two hundred and fifty, bearing fifty thousand tons. How swift a growth of prosperity.

The real lamp of Aladdin is that on the merchant's desk. All the genies, white, olive or black, who people the atmosphere of earth, it puts in motion at the antipodes. It builds palaces in the wilderness and cities in the forest; and collects every splendor and every refinement of luxury, from the fingers of subservient toil. Kings of the east are slaves of the lamp: the winds blow, and the seas roll, only to work the behest of its master.

ART. V. *A Short Account of the Settlement, Produce, and Commerce of Prince of Wales Island, in the Straits of Malacca. By SIR GEORGE LEITH, Bart. Major 17th Foot, and late Lieutenant Governor.* 8vo. pp. 94.

THIS island is unwisely named. There is another Prince of Wales Island off the coast of New Holland. It may be very loyal to have George-towns and Prince-of-Wales islands all the world over; but it occasions confusion and mistake in the memory, and will, in due time, occasion very troublesome miscarriages at the post-office. How inconvenient to the ancient world were its Selucias and Alexandrias,

The island here described was formerly called Pulo Pinang, or Penang, and is situate in the straits of Malacca, opposite the Queddah shore, on the Malay peninsula. It abounds with ship-timber and masts of all dimensions. It enjoys a cli-

mate and a soil applicable to the most precious cultivations of the east. It is inhabited by new settlers of all descriptions, Europeans, Chinese, Chooliahs, Burmahs, Pursees, Malays, and Buggesses, a people from Borneo and Celebes, hitherto confounded with the Malays, but differing from them in language. Of the commerce these particulars are given:

"COMMERCE.

"The principal, if not the only view in forming this settlement, appears to have been the acquiring a port in the Straits of Malacca, for commercial purposes; and there certainly is not in any part of India a place so well adapted to this end as Prince of Wales Island; at the same time it undoubtedly ex-

joys great advantages as a naval port.—Hitherto the productions of the island have constituted but a small portion of the extensive commerce which has flourished here for some years; but although this portion has, as yet, been inconsiderable, there is the most satisfactory and pleasing evidence that it is daily increasing. The numerous, extensive, and highly cultivated plantations of pepper, and beetle-nut, which are every where rising into view, will, in a short time, afford large cargoes of those articles, without the trouble and expence of importation. It is computed that there will be upwards of fifteen thousand peculs of pepper produced on the island this year; (1803-4), and that, in the course of three or four years more, the plantations will yield more than twenty thousand peculs. Coffee also promises to become a valuable commodity; this berry has been imported from different quarters, and they all thrive very well, and produce fine flavoured coffee. The sugar cane grows with uncommon luxuriance; but as the price of labour is very high, the expence attending the making of sugar, will prevent a very extensive cultivation of the cane.

"The spice plantations, in which there are many thousand clove and nutmeg trees, are so flourishing, that the island may reasonably hope, in a few years, to be able to furnish a valuable cargo of cloves, nutmegs, and mace; with their essential oils, and also the so much esteemed Kyapoottee oil.

"However the productions of the island may increase in various articles, the principal source of wealth must arise from its being considered as the best and greatest port of exchange in India. Ships and vessels come here from every quarter, and can exchange the commodities they bring, for those which are required as a return cargo. This affords the merchant the very important advantage of a quick return of his capital.

"As there is not a custom house on the island, it is not possible to form an accurate idea of the extent of the general imports and exports. In the year 1801-2, an import duty of two per cent. *ad valorem*, was laid on tin, pepper, and beetle-nut; from the return given in by the renter of this duty, it appeared that the following quantities of these articles were imported, viz.

China Peculs. Catties. Amt. of the Duty.

			S. D.	P.
Pepper	29,468	5½	5,251	97½
Tin	14,136	86	3,982	63½
Beetle-nut	45,819	90½	3,842	16

Sp. Ds. 13,076 78

"The following statement will shew at one view the different places which supply the trade of this port, with the articles of import and export.

"IMPORTS.

"From Bengal.—Opium, grain, iron, steel, marine stores; piece goods, which con-

sist chiefly of Hummums, Gurrahs, Baffies, Cossas, Tanjabs, Mamoodies, Chintzes, Kurwahs, Taffatees, and Bandanoes.

"Coast of Coromandel.—Salt, tobacco, Punjum cloths, kaal-blue cloths, handkerchiefs, coir rope, and yarns; chintzes; and a small quantity of fine goods.

"Bombay and Malabar Coast.—Cotton, salt, a few piece goods, red wood, sandal wood, shark fins, fish mote, putchuck, myrrh, Surat piece goods, oil, &c.

"W. Coast Sumatra.—Pepper, benjamin, camphire, gold dust.

"Acheen and Pedier.—Gold dust; beetle-nut, white and red, cut and chickney; pepper, rice, and Acheen cloths.

"Diamond Point.—Rattans, sago, brimstone, and gold dust.

"East Coast.—Tin, pepper, Java arrack, sugar, oil, rice, tobacco, &c.

"Junk Ceylon.—Tin, birds nests, beache de mer, sepuh, and elephants teeth.

"Tringano.—Pepper, and gold worked cloths.

"Borneo.—Gold dust, sago, and blackwood.

"Moluccas.—Spices.

"China.—Tea, sugar, lutestrings, velvets, paper, umbrellas, China ware of all kinds; quicksilver, nankeens, tutenague, sweetmeats, pickles, and every article required by the Chinese inhabitants; raw silk, copper ware, China camphire, China root, allum, &c. &c.

"EXPORTS.

"Sumatra. E. and W. Coasts.—All the various piece goods from Bengal, the coast, and Bombay; cotton, opium, iron and tobacco.

"Junk Ceylon.—Piece goods, and opium.

"Tringano, Java, Borneo, Celebes, and Moluccas.—Iron, steel, opium, Bengal piece goods, blue cloth; Europe coarse red, blue, and green cloths, and coarse cutlery.

"China.—Opium, cottons, rattans, beetle-nut, pepper, birds nests, sandal wood, shark fins, Sumatra camphire, tin, beache de mer, cutch, and sepuh.

"Bengal Coast and Bombay.—Pepper, tin, beetle-nut, cut and chickney; rattans, camphire, gold dust, &c.

"In addition to the quantity of pepper at present annually exported from this port, almost any number of tons could be procured for the London market, should it ever be deemed advisable to send it home on account of the honourable company, and we may safely venture to assert, that the pepper will be of as fine a quality as any ever procured; and the pepper produced on the island is considered cleaner than that of the surrounding countries: and in general, in equal measures, it is heavier.

"In the year 1802, a thousand tons of pepper of 20 cwt. were sent from the island to Europe, without having the smallest effect on the surrounding markets. That, and im-

ded a much larger quantity, could easily be procured, without any risk of raising the price, viz. 50l. sterl. per ton of 20 cwt.

"Innumerable indeed are the advantages which would accrue to this settlement, were the exportation of pepper produced on the island, direct to the London market on the honourable company's ships, once established; nor would these advantages be confined to the settlement alone, as considerable benefit, it is confidently presumed would also arise to the honourable company from this branch of commerce. The experiment at least appears worth the trial; all the expenses attending it, will be apparent at one view, and even if the flattering expectations which are now entertained should not be fully realized, still there is no prospect of risk, or loss, attending the measure. To the pepper, the product of the island, many other articles might be added, if required, as rhubarb, gallingal root, turmeric, cochineal, &c. &c.

"One of the most convincing proofs which can be adduced of the flourishing state of the commerce of this rising settlement, will be found in the following table, shewing the number of ships, with their tonnage, which have entered into and cleared out from this port, within the last four years, and as a considerable portion of the trade of the island is carried on by prows, an account of them is also subjoined.

To the general reader this account will be more amusing and more instructive than the description published by sir Home Popham; but those who are called on to determine whether directions shall be given in London to forbid the sea to encroach on the north face of the fort and esplanade, by the construction of vast stone moles, and piers—whether directions shall be given in London for founding huge docks and naval arsenals—in short, whether all the profits of this well-situate and rapidly rising establishment shall be given away to the place-mongers and projectors of jobs—will do well to read all the accounts. That of captain Macalister passes for the less accurate and precise.

ART. VI. *Narrative of a Voyage to Brasil; terminating in the Seizure of a British Vessel, and the Imprisonment of the Author and the Ship's Crew, by the Portuguese. With General Sketches of the Country, its Natural Productions, Colonial Inhabitants, &c. and a Description of the City and Provinces of St. Salvador and Porto Seguro. To which are added, a correct Table of the Latitude and Longitude of the Ports on the Coast of Brasil, Table of Exchange, &c.* By THOMAS LINDLEY, 8vo. pp. 298.

EARLY in 1802, Mr. Lindley sailed from the Cape of Good Hope for St.

Helena and a market, this is his phrase; and the original destination of the brig is

not otherwise explained. After leaving St. Helena, a severe squall considerably damaged the vessel, and obliged him to bear away for Brasil. He repaired at Bahia, or St. Salvadore, and from thence intended to steer for Rio Janeiro, where he expected a ready sale of his cargo to the Spaniards trading from the River Plata. But a storm sprung up just as he had cleared the bay, and obliged him to put into Porto-Seguro, which port, however, he did not reach without the loss of the rudder.

While he was detained for repairs here, the civil governor, or judge of the province, proposed to barter Brasil wood with him for goods. 'The proposal appeared so advantageous,' says Mr. Lindley, 'that I could have no hesitation, except from an uncertainty whether this wood was allowed to be exported; but as the offer came from the governor himself, I considered any prohibition that might exist as merely nominal; and every doubt being thus dispelled, I agreed to the exchange.' The plain English of which is, that he knew he was engaging in a contraband trade, but thought he could do it securely. Gaspar, one of the governor's sons, transacted the bargain, and his brother Antonio was to get the wood ready; but the business was not kept secret, and in about a week's time both father and son said it must be given up, regretting the mutual disappointment, and telling Mr. Lindley that he might procure the wood he wanted by another channel, and should meet with no hindrance or opposition on their part. Another adventurer was soon found, but wood is a clumsy article to smuggle; the errand of the English ship was pretty well understood, and Gaspar requested the captain, in the strongest terms, to decline the business altogether, saying, that he had secret reasons of the most forcible kind for his advice. In consequence he set sail to proceed on his destination; the repairs had been so badly made, that he was obliged once more to come to anchor in the river of Carevellos, near at hand; and before the carpenters here had completed their work, the brig was seized by the Portuguese government, and the crew conducted back to Porto Seguro. An inhabitant of that place, to revenge an old quarrel upon the governor, had laid an information against him for smuggling with Mr. Lindley.

Mr. and Mrs. Lindley were taken to the common prison: they were led into an upper room, in the floor of which a trap-

door was opened, down which they descended by a ladder into a dungeon. Three corners of this wretched place were filled with heaps of dirt, rubbish, orange-peel, and the refuse of other vegetables, rotting together; the fourth with filth of a more disgusting kind, for four of his sailors had been confined there for eight days, and were just removed to the next dungeon to make room for him and his wife. In this place they remained a fortnight, burning a fire during the day, notwithstanding the exceeding heat of the weather, as the only means of amending the bad air. At length Mr. Lindley was examined; he denied that any Brasil wood had ever been brought on board the brig; but was 'perfectly explicit respecting his intention to have purchased some,' had he not discovered in time the strictness with which that article was prohibited; that is, he betrayed the whole transaction with the governor and his sons. After this examination, in consequence of his entreaties, they were removed to an upper apartment.

There had been found, in his writing-desk, a paper containing a small quantity of grain gold, intermixed with gold-coloured sand, which had been brought to him by an inhabitant of Porto Seguro as a sample. When closely questioned concerning this, he made no secret of whence he had obtained the article, but declared he knew neither the name nor residence of the person from whom he had received it, though he believed that he was from a distant settlement. They took him a day's ride into the country to point out the man, whom he was predetermined not to recognize if he met him. The stream, however, from whence the sample had been collected was found, a guard set over it in the queen's name, and a farther sample taken to be assayed at Bahia.

The sailors had been ill supplied with food. On Mr. Lindley's remonstrances this was remedied. His situation was not much ameliorated; he was called to visit the sick, and obtained permission to take the air with his wife. Still there was much to complain of.

"Their impudence is unbounded, even to insult; while I can only resent it by reproach or unavailing complaint. The captain, Mor, who has superior apartments in the prison, takes the liberty of running into mine without excuse; not considering the situation of Mrs. Lindley and myself, confined to a small room, and who do not at all hours chuse such visitors: besides constantly using my liquor for himself and friends, notwithstanding he knows I purchase it on the spot, and have no support

allowed me. The judge ordinary, or magistrate of the town, daily visits the prison, and uses the same freedom: this morning he presented us with a basket of eggs, begged a silk handkerchief in return, and, whilst talking on the subject, reached a clothes-brush from the wall, and, *sans ceremonie*, brushed his hat in our faces. Each poor meal we make, we are necessitated in the first instance to secure our door from intrusion: and a thousand other meannesses we daily endure.

"The very dress of the men (particularly in the morning) is shocking to a person of the commonest delicacy. They promenaded the prison in a thin pair of callico drawers that scarce reach the knee, with the shirt loose over them, and no stockings or hat: if cool or rainy weather, they sometimes have the addition of a cloak or bed-gown loosely wrapt round them. In short, maugre every exertion of patience, our situation is miserable; and most gladly shall I hail the happy day of our arrival in a land of decency."

After ten weeks confinement they were removed to Bahia, and again put in a dungeon; a long arched vault, with a plank-work on one side to sleep on—the old *es-trado*. The captain of the fort executed his orders with due fidelity in placing them there; but advised Mr. Lindley to write to the governor of Bahia, supplied him implements for the memorial, and dispatched it. On the morrow the commandant of the sea, as he is here called, came himself with an order for their release from the dungeon, and that they should have an apartment, and the liberty of the fort. Both the commandant and the captain of the fort seem to have done every thing which men of honour and of feeling could do, consistently with their duty, to alleviate his confinement. He was shortly afterwards confronted with Gaspar and Antonio, who steadily denied the whole transaction, which he, on his part, as consistently confessed. Assassinations, Mr. Lindley remarks, are not common in Bahia; and it is a proof this, that he walked the streets of the city in safety six months after he had betrayed this family.

His ship and cargo were now valued infinitely below their real worth. The cargo had been pillaged, and much damaged; but he was obliged to sign a paper, attesting that the whole was in the same condition as when first seized. The crew meantime were allowed eight-pence a day each; they were in want of clothes, for their chests, as well as Mr. Lindley's trunks, had been plundered. He was now informed that he could not be sent to Lisbon till orders came from thence, in

reply to the dispatches sent concerning him; but the governor would permit him the liberty of the city, if he would petition for it on the plea of illness, and procure certificates to that effect. This Mr. Lindley thinks proper to call a mean and paltry subterfuge from the great and mighty governor of a country! though he availed himself of the humane offer. The return he makes is to publish the fact, and print, at full length, the names of surgeon and physician who attested, on oath, that he was dangerously ill, without having seen him. The next Englishman who is detected in smuggling at Brasil will be left to rot in a dungeon. He waited till August in expectation of being sent to Lisbon, then with his wife, mate, and servant, made his escape in a vessel bound for Porto.

"After the usual voyage, I arrived at Oporto on the 2d of November, and found vessels from Bahia that had sailed subsequent to ours: in consequence, I expected that information had been received of our escape, and was apprehensive of some embarrassment; but my fears were groundless. I applied instantly to the acting consul, Mr. Warr, who pointed out the necessity of my proceeding immediately to Lisbon. In four days I reached that city, and waited on lord R. S. Fitzgerald, our residuary minister, who received me with the most soothing and polite attention, and entered into the merits of the affair without losing a moment. Jointly with Mr. Gambier, the consul-general, his lordship had the goodness to assure me it should be forcibly represented to the Portuguese government, that a satisfactory recompence might be obtained for this unjust outrage on British subjects, and the sufferings that had been so wantonly inflicted on myself and wife.

"His lordship honoured me with an introductory letter to lord Hawkesbury, which on my arrival in England I presented, and was referred to the secretary of state's office, where I attended at various times till the middle of June last, when I received the unpleasant intelligence (as well by advice from lord Robert Fitzgerald), that the Portuguese government had finally resolved, that no restitution or recompence whatever should be made in the affair; thus leaving me no further prospect or hope of redress, for the injuries I have in so many respects sustained—in my feelings, my health, my time, and my property!"

No other termination of the affair was to be expected. Mr. Lindley was engaged in a contraband traffic, no matter whether with the chief magistrate of Porto Seguro or not, and no matter whether he knew it to be contraband or not; ignorance of the

law will no more excuse a breach of the law in Brasil than in England.

The volume contains many amusing traits of national manners. It is very remarkable that knives and forks are not yet in general use among the Brasilians.

"They first take in their fingers a little meat (which is always so much over-done, as to be readily separated), then vegetables, and *farinha*; these they roll in the sauce, oil, or soup, with which their plates abound, squeezing the whole in the palm of the hand into the shape, and about the size, of a wash-ball; which, when thus prepared, they convey into their mouths at once, and whilst eating form another.

"Indelicate and disgusting as such a picture may seem, it is not overcharged; both sexes equally use this practice; and most classes; even when before strangers, if by chance they take up a knife and fork, yet they are soon tired of a mode so unusual, slow, and tedious; and they involuntarily drop it; and fall to in their old way with redoubled eagerness. It is true, that, as in the east, water is presented before and after eating; but it is by no means an apology for this barbarous and dirty custom."

"It is astonishing to see how little subordination of rank is known in this country: France, in its completest state of revolution and citizenship, never excelled it in that respect. You see here the white servant converse with his master on the most equal and friendly terms; dispute his commands, and wrangle about them if contrary to *his better opinion*—which the superior receives in good part, and frequently acquiesces in.

"The system does not rest here; but extends to the mulattoes, and even to the negroes. One sees no humiliation except in the patient hard working drudge, the native Indian.

"The same licentious freedom is found in their marine and troops. On board of ship an order is seldom issued without the sailors giving their opinion on it, and frequently involving the whole in dispute and confusion. In consequence, each officer walks the deck with a stick of no small dimensions, as a mark of authority; to use as occasion requires, and carry on the duty of the vessel.

"The captain of the fort I am in, traverses the platform in a pair of coarse printed cotton trowsers, a jacket of the same, with a supplejack in hand, commanding his working party of artillery-men under the title of *comrades*. I took the liberty of remonstrating about his wooden companion; but he replied, 'No duty could go on without it.' At Porto Seguro, I have often seen the lieutenant, serjeant, and a private, in the same card party: even the captain (*mor*), and others the most respectable inhabitants, betting, and taking part in the game, without scruple. This unreserved freedom is productive of the most pernicious consequences; you get no command promptly

obeyed, and strangers who expect better are ever liable to insult. I attribute this promiscuous intercourse to the general ignorance that pervades the country; as no people pretend to more *hauteur* and reserve than the Brasilians, or really have less, in their own society."

Bleeding and clysters of human milk are the grand specifics. Mr. Lindley was called in to one poor wretch who had been bled one and twenty times in the space of nine days for a pain in the breast, and of course fairly died of the doctors. They have an extraordinary Guy Faux at Bahia.

"In my walk to the city a considerable crowd occupied the street, and I was obliged to stop till the occasion was over. This proved to be the destruction of poor Judas in effigy: when, not content with all the anathemas this day thundered against him, and the eternal torment to which he is consigned, the populace in different parts of the city dress up a masked figure, and erect a gibbet on which they exalt him—as do the shipping also from their yard-arms. At eleven in the morning they discharge musquets at the traitor; and set fire to rockets fastened at his back, and crackers concealed in his dress.

"In the exhibition which I witnessed, the rage of the good Catholics was not satisfied with hanging and blowing up poor Judas; but they afterwards lowered his remains, and dragged them in triumph through the street."

The sugar-works are in a state of primitive simplicity.

"The word *ingenio* is the Portuguese distinction of those who have a sugar-work:—here very simple, consisting of three rollers of ponderous wood, two feet in diameter and three in length, working horizontally in a frame: the upper part of the center roller joins a square beam that ascends through the frame work; and to which are affixed cross pieces sufficiently low for the harness of two horses, that move the whole. The side rollers work by cogs from the center one. Underneath this machine is a long trough, slanted, that receives the juice of the cane as pressed out by the rollers. The juice is thence conveyed to a shallow boiler of six feet diameter, and skimmed from all impurities; after cooling in another vessel, they add an alkali of wood ashes, suffer it to stand some days, pour off the pure liquor, convey it to the same boiler, and evaporate till the sugar is formed, the settlings, &c. being distilled to a powerful spirit. How widely different is this primitive sugar-making, from the immense works, machines, and engines, employed by our West-Indian planters!"

Notwithstanding the rudeness of this machinery, and notwithstanding the general darkness of Mr. Lindley's colouring, it is easy to perceive that the country is in a state of improvement. He indeed says,

that government is using every diligence, to render it more productive. Salt-petre mines, perhaps the first in the world, have lately been opened, and the pepper-shrub imported from India, and thriving uncommonly well. Some interesting passages relative to natural history may be selected.

"I was called this morning to visit a sick planter, who chiefly cultivates mandioc, that invaluable root which forms the farinha, or bread of South America, and I had an opportunity of minutely viewing the whole process of preparation. Mandioc is a knotted shrub that runs to the height of six feet and upwards, but without branches; the root, which is the only useful part, somewhat resembles a parsnip, but is much larger. It is planted by cutting the body of the shrub into short lengths, and sticking them into the earth, when they immediately reshoot, and, after growing for about twelve months, the root is perfectly formed, but varies in size according to the fertility of the ground, from one to twenty inches in diameter, and from six inches to two feet in length. The roots being pulled up, and the exterior bark cut off, a farinaceous substance remains, milky and glutinous; this is rubbed to small pieces against a rasping wheel covered with perforated copper, and received into a trough below; it is then dried in shallow pans over a slow fire, till all moisture is evaporated, when it appears a dry granulated substance, and is ready for use. Tapioca is the juice of the root drained from the raspings, and granulated in like manner over a slow fire.

"Farinha was in use among the Indians of South America at the time of its discovery, and imperceptibly adopted by its conquerors, wheat not agreeing with the soil, and mandioc being cultivated at an hundredth part of the labour and expence."

The bees form nests which load the trees. They consist of a ponderous shell of clay, cemented like the martin's nest, swelling from high trees about a foot thick, and forming an oval mass full two feet in diameter. The wax within is arranged in the usual manner, and the honey abundant; but little use is made of either, sugar being the growth of the spot, and wax supplied plentifully by the African colonies.

"For many days there has been an immense flight of white and yellow butterflies. They never settle, and proceed in a direction from the north-west to the south-east. Neither the fort nor any other building impedes them: they steadily pursue their course; which being to the ocean (at only a small distance), they must consequently perish.

"It is singular that at present no other kind

of these insects is to be seen, notwithstanding the country generally abounds in such a variety."

"I was caught on the beach in the severest fall of rain I ever witnessed. While standing under a shed to avoid its violence, I all at once observed the air full of a small flying insect, which the people near me called *Asian ants*.* This is the moment they use for multiplying their species, after which they drop; when their transparent wings sticking to the moist earth, they make a violent effort and leave them. The insect then appears as a small maggot, which immediately divides, and each part seeking the porous earth soon disappears: the larger ones always leave their wings; while some smaller, after separation, regain the air. On my arrival at the fort, I heard they had there also swarmed in myriads, as just observed.

"The large ant already noticed, is also in a state of chrysalis at this season. It is far increased in size during this change; and after continuing some time in the air, returns to the earth, shedding its wings as those which I saw yesterday: while some, unable to effect that change, lie motionless, and soon expire. A nest which I passed of these insects was opened, with some hundreds of the winged ones (which I imagine females) taking flight from the mouth of it; while myriads of young ones continued uninterrupted at work."

The natives, who are not always pacific, are formidably armed.

"The bows of these Indians are similar to the English long bow; about six feet six inches in length; strong made, of a ponderous wood, but particularly elastic, and strung with the dried sinews of an animal, or sometimes a prepared cotton cord. Their arrows are three and four feet in length, well feathered, and consist of one piece of light wood: the points of the larger sort are simply the arrow tapered, and afterwards notched for about eight inches, to prevent its easy extraction; the shorter have a broad scoop head, about four inches long, and one broad in the center part of it, tapering each way to its point, and where it joins the stem; this head is concaved to a sharp edge, and is a fatal weapon. They harden both heads in the fire; and though the whole arrow feels very light, and appears insufficient to pierce at any distance, yet it kills at nearly as great a distance as an European musket."

On the whole this is a volume which may be read with amusement and advantage. We have, however, to reprehend Mr. Lindley for the dreadful indiscretion with which he has published the names of persons, who, in the confidence of friendship, uttered their sentiments to him, and showed him the secret treasure of their libraries, little thinking that all was to be

* Vermigues d'Asie.

thus betrayed! A familiar of the inquisition would not have been a more dangerous, nor a more deadly companion for them. No Englishman will ever be received with kindness or confidence by a Brazilian after the publication of this most imprudent book, and no English prisoner there must ever again expect the slightest relaxation of law, or the slightest alleviation of imprisonment.

ART. VII.—*African Memoranda: relative to an Attempt to establish a British Settlement on the Island of Bulama, on the Western Coast of Africa, in the Year 1792. With a brief Notice of the neighbouring Tribes, Soil, Productions, &c. and some Observations on the facility of colonizing that Part of Africa, with a View to Cultivation; and the Introduction of Letters and Religion to its Inhabitants: but more particularly as the means of gradually abolishing African Slavery.* By Captain PHILIP BEAVER, of his Majesty's Royal Navy. 4to. pp. 500.

What shall I do to be for ever known,
And make the age to come my own?

IS the fine question which Cowley asked of himself, and answered, not triumphantly, by his poems. The projects of Mr. Beaver's ambition were different: he once planned an excursion to the north pole; then a journey through the interior of Africa; and thirdly, to coast the world. He was at length induced by circumstances to conduct an enterprize for the colonization of Bulama.

This volume contains a narrative of all the transactions relative to that undertaking: it defines the chances of success and the causes of failure: it preserves the hints and the warnings of experience, and deserves to occasion a repetition of the attempt. Mr. Beaver's personal conduct compels high admiration: he is one of those natural heroes who wanted only other followers to have founded, like Æneas, a permanent empire in a strange and savage land: he ought again to be solicited by his country to undertake a command, of which the highest recompense will be its eventual success.

The first chapter relates the proceedings of the Bulama society in England.

The second chapter contains the adventures of the colonists, from their leaving England to their arrival in the Bijuga channel on the coast of Africa.

The third chapter contains a summary of the fortunes of those embarked in the Calypso, which separated rather shabbily from its companions at the outset, and which deserted the expedition, on the first pretext of difficulty, with ruinous retraction.

The fourth chapter details the proceedings of the colony from their landing to the retreat of the crew of the Calypso.

The fifth chapter preserves lieutenant Beaver's journal on the island of Bulama. By the progress of disease and desertion, he is at length reduced to the necessity of

return: only one of the original colonists remained with him to the last.

Here ends the historical portion of the book. Six speculative chapters follow, which treat of the advantages to be derived from the experience collected during this attempt—of the causes of failure which are stated, convincingly, not to lie in the difficulty or impracticability of the enterprize—of the geographical character of that part of the African coast between the Gambia and Rio-Grande—of the Bijuga islands, and of Bulama especially, their soil, productions, and capabilities—and lastly of the wisest plan for a future colonization.

An appendix follows containing the public papers of the colony; nautical remarks; meteorologic journals; and other particulars worthy of preservation, which could not well be inwoven in the narrative, are here separately chronicled.

The first difficulty opposed to this effort at colonization arose from the antijacobinism of Mr. Secretary Dundas, who laid an embargo on vessels which had been purchased by voluntary subscription, and were freighted with voluntary emigrants. The constitution of government, forsooth, in which equal subscribers had equal rights of suffrage, and chose a council for the management of their affairs, had given offence. This being cancelled, the ships were suffered to proceed: but whereas the colonists originally thought themselves bound to obey the governors they had elected, they now knew that there was no legal authority over them; thus the pedantry of Mr. Dundas bestowed a practical anarchy on the colonists, and prepared the critical return of the Calypso-party.

The colonists, it may be urged, should have obtained a charter. There are two plans of colonization equally practicable. The one is to go out with the connivance of the different European governments,

but without the specific protection of any plan to begin on a system of independence, and to preserve a strict neutrality during the wars of Europe. The other is to go out with the concurrence of a specific country, and to solicit its aid: where this is the intention, the form of declaring allegiance and of promising protection, ought unquestionably to take place; in other words, a charter ought to be obtained. At the time of the Bulama subscription, the friends of the blacks were sufficiently numerous, both in France and England, to have conjointly colonized a vast tract of Africa for the purpose of cultivating cotton by free labourers. The democratic constitution of the colony was adapted to the admission of people of all kinds and countries: difficulty of any kind would always have occasioned the necessary deposit of authority with the few leading minds. A colony from all nations, a North-America in Africa, free, independent, at perpetual peace, and open to the commerce of the world, might well have comprehended a larger portion of white settlers, and have attained a speedier civilization, than under the monopoly system of British intercourse.

Mr. Beaver's method of acquiring ascendancy over the negroes is thus recorded in his journal.

"Read prayers. Sent the Industry, with Mr. Scott, to Bissao. Therm. 88. Bennet sick.

"Employed as usual till nine o'clock, when Bellchore, with two canoes, paid us another visit. Left off work, and collected the grumetas within the block-house, which Bellchore, and two attendants only, are permitted to enter, at the gate of which they deliver up their arms, and they are returned to them when they go out again. The rest of his people, in number twenty-eight, occupy the grumetas' huts. I am now strong enough not to care for these people, they can do nothing by open force. I had intended to have reproached Bellchore for his treacherous conduct in having been here with a large armed force, with a view of attacking us; to have assured him that nothing that he had done was unknown to me; then to have flogged him, and turned him unarmed from the island; but as we were now safe, and had nothing to fear from them hereafter, I thought it more advisable, on reconsideration, to receive him in a friendly manner, and pretend ignorance of what had passed.

"In the evening, at the request of Bellchore, we fired several six-pound shot in various directions, to the great admiration of the Bijugas, particularly one, which I had told them, before it was fired, should come out of the water four or five times. It did so in fact

seven times. ~~They~~ ^{They} exclaimed, clapping their hands, "all white man witch;" this, simple as it appears to us, they could by no means comprehend, and thought that nothing short of witchcraft could possibly foresee that a shot fired into the water, should come out of it again four or five times. Another shot they were told should go through a tree, distant I suppose not more than two hundred yards. It went through its centre, and they were all astonishment: but what seemed to stupify them with wonder was the accidental circumstance of my sitting upon one of these six-pounders while it was fired.

"It has ever been my custom, since the departure of the Hankey, to fire a morning and evening gun, that is, one at dawn of day, and one at sunset. When the latter is fired the drum is beat, the colonists retire to the block-house, which is then locked, and the key put under my pillow, and no one can, after that time, go in or out without my permission. We had for some time left off firing to amuse the Bijugas, when, it being just sunset, I was sitting upon the gun that was to be fired, talking to Bellchore: as the boy approached with the match, Bellchore ran away, for though they are highly delighted with the noise of a cannon, they keep at a very respectful distance, while it is fired; and notwithstanding they have so often seen my little boy, not more than twelve years of age, fire one, I suppose no consideration could induce one of these people to do so. As before observed, I was accidentally sitting upon the gun when the boy came to fire it: Bellchore immediately ran away—I remained—the boy fired, and I verily believe they expected to see me dead.

"They had before a great idea of the power which I possessed in common with all white men, of performing miracles, or rather of being a magician, and they now believed me invulnerable—a belief that I was at no pains to undeceive them in. Therm. 86. Bennet sick.

"As we did no work while Bellchore was here, in the morning I amused him and his people, as well as myself, in shewing them many things which riveted their faith in my magic power, and which they at last believed to be unlimited.

"I made them remark the north point of my circumferenter, and then, desiring them to turn it several times round, or put it in any other position, observe that they had not the power of moving that point, because I had ordered it to remain where it was. They saw that it was so, and could not comprehend why it was, unless by my power, fixed to that point. The bubble in the spirit level of my theodolite, they thought alive; and the distinctness with which they viewed distant objects, through a good telescope, increased their belief in my magic. But there was one thing yet to shew them, which would fully convince them that nothing was to me impossible. It was near noon, and I was regulating my watch by the sun. The watch had

for some time taken up ~~by the sun~~ which they thought, as well as the spirit level, was alive: particularly after, (for at first they would not believe that the minute hand had motion, which is too slow to be readily perceived by the eye) I had made one of them hold a pin, five minutes before the minute hand, and then explained to him, that in a certain time that hand would go to the pin, and then pass it; for instance, whilst another walked to a certain tree and back again. This they all perceived; but, wonderful as it was to them, it ceased instantly, as well as every thing else, to occupy any of their attention, when I played off my last trick. With my quadrant I brought the sun down upon the top of the block-house, and then desired Bellchore to look at it, which he did, and then, one after another, all his people; when, placing one of his men before me, I told him that I would put the sun upon his head. The poor Bijuga at first was frightened, and unwilling to stand where I desired him; but, on my repeated assurances that no harm should come to him, he consented, and I shewed to his astonished countrymen the sun upon his head.

"In the evening Bellchore left me. He had been much struck with the strength and magnitude of our building, and will never, hereafter, I am confident, attempt any thing against us. Besides, what can he expect to achieve against a man who can sit upon a cannon, "against which there is no gris-gris" while it is fired; and can put the sun upon another man's head? The Industry returned this evening from Bissao with six new grumetas."

The result of Mr. Beaver's interesting experience, which constitutes a sum of knowledge worth the expence at which it has been purchased, is thus very modestly summed up.

"What did we propose to ascertain?

"First—Whether we could cultivate the tropical productions on the Island of Bulama and the adjacent shores?

"Second—Whether we could do so by the means of *free natives*?

"Third—Whether by *cultivation* and

commerce we might not introduce among them *civilization*?

"The first of these queries is proved beyond a doubt, not only by what I cultivated on the island; but from all tropical productions growing wild on it, or in its vicinity.

"Now then for the second, which is by far the most important. It will appear by the list of grumetas in the Appendix * that in about one year I employed on the island 196 of them. These grumetas were not all of one nation: neither were they only of two; but they were of three, of four, of five, and even of six,† and they were all free. Had it been prudent, with my reduced force, to have employed more, I could easily at all times have doubled or trebled their numbers. These grumetas cleared all the ground that was cleared, they made the inclosures, and worked hard and willingly, generally speaking, at whatever task was assigned to them. I have no hesitation therefore in declaring *that the second also is proved: and the third will necessarily follow*—for *COMMERCE* will follow *CULTIVATION*, and *CIVILIZATION* will result from them both.

"When the peculiar disadvantages enumerated in the former part of this chapter, are added to those arising from the general character of the settlers, and of some of the grumetas, as well as from the smallness of our force for the last year, our having been able to command respect, and to accomplish what we did, must remove from the mind, I think, of all unbiassed persons, every doubt as to the practicability of accomplishing all which we had promised ourselves, had the expedition been planned with more wisdom, or executed with more energy. And although we were obliged to quit the island at the moment when we had shelter and protection for more settlers, and fields ready for the plough, yet I trust that our labour has not been altogether fruitless, but that we have been paving the way for some more fortunate enterprise. And though in this undertaking our mortality has been great, nay dreadful indeed, yet have we the satisfaction to say that no one ever fell by the hand of an enemy;‡ that we never had any quarrel with the natives; and that the English character which we found considered by them as sordid, base and cowardly, we left

* No. 15.

† I regret much that I did not, when on the island, keep an account of the nations to which my several grumetas belonged, as, besides being more satisfactory to the reader, it would have enabled us to form some little notion of their national character. However, by far the greatest number were Papels and Manjacks; about a dozen of the whole number were Biafaras, a few Balantees, four or five were Naloos, but only two Bijugas. I had Biafara visitors frequently, and with them sometimes came Mandingos, but I never had a Mandingo grumeta, though they have frequently come to the island in that situation, in canoes belonging to Bissao. I sometimes also had visits from Bulola, a place about seventy miles up the Rio Grande, but in what nation to place its inhabitants I know not. They are I think a mixture of Biafaras, Naloos, and Mandingos; at least people of each of those nations reside at Bulola, and there is frequent intercourse by land between Kacundy on the Nunez, and Bulola on the Grande. Woody Toorey was at this time queen of Bulola; she often pressed me to come to her town, but I never was able to accomplish it.

‡ The reader will remember that we had not arrived when the Calypso's people were attacked by the natives.

beloved, respected, and admired; yet its enmity was valued as much as its friendship was courted. And although we have not been hitherto able to reap the fruit of our labour, I hope that the day is not far distant, when some enlarged and liberal plan will be adopted to cultivate the western coast of Africa, without interfering with the freedom of its natives. Such a plan, pursued with a wise policy, is the surest way of introducing civilization, and at the same time of abolishing slavery; and if the preceding account shall in the smallest degree lead to such a measure, I shall be amply repaid for all the time and trouble I have expended, and all the difficulties I have encountered."

What remains for national consideration is the expediency of reviving a disposition to form settlements in Africa. This is the only quarter of the world in which British language and British commerce have struck no root; to which the advantage of our laws, the benefit of our protection, the civilizing influence of our manners, our intercourse, and our literature, have not been extended. It is the bed of a soil, which we have not attempted to cultivate; the atmosphere of a climate, which we have not endeavoured to purify; the home of a barbarism, which we have not sought to dissipate; the seat of a slavery, which we have not taken steps to abolish. Let us try. The solid pyramids of African antiquity attest the possibility of labour in vain: let the hollow warehouses of modern industry demonstrate the possibility of labour to advantage. The first roads will only be accessible to the keel; but the next to the camel and the elephant: to fleets will succeed caravans; to a coasting-trade, internal traffic.

The elephant and the hippopotamus of this part of Africa, have hitherto been hunted down, as the foes of men, for the puny recompense of their ivory teeth. From Mr. Beaver's testimony, and from that of other zoologists, it is probable that their alliance would be more profitable than their enmity. Both appear domesticable. The elephant can carry burdens; the hippopotamus can tow boats. Great care is wisely recommended to impress on the black man an opinion of the justice and humanity of Europeans: ought not analogous precautions to be taken for impres-

sing on these powerful animals a similar opinion of the friendliness and compatibility of the white man? Camels, but not yet, will be requisite in these districts. Ants are troublesome there: the partridge, which is a voracious ant-eater, might be carried over. Swine are the appropriate enemies of serpents.

The following hints for commencing the settlement of Bulama, deserve conspicuousity.

"Supposing the colonization of the country between the Gambia and the Grande, as well as the uninhabited Bijuga isles, to be undertaken by individuals sanctioned by government, or else by government * itself, I should recommend the repossessing ourselves of Bulama immediately; and, upon the fertile soil of that beautiful little island I should commence such a plan of cultivation, which, with common prudence and common success, would, I doubt not, in less than twenty years export to the parent country produce to the value of more than a million sterling; and, it requires no great share of credulity to believe, might soon after take from Great Britain her manufactured goods to more than that amount; for which the colony would make its chief returns in raw materials, for British industry to work up; and these would be returned to it at an amazingly increased price; which is, of all others, the most advantageous commerce that one country can carry on with another.

"We will therefore suppose the colonization of these countries seriously intended; and that a certain number of persons are arrived, at the proper season of the year, that is to say, just after the rains, on the island of Bulama; those persons will find an uninhabited and fertile soil; and grumetas, or labourers, may be readily procured in the neighbourhood. Six months dry weather may be certainly reckoned upon, if they arrive at the proper time; in which they may clear their grounds for cultivation; and cotton, as the least difficult and least expensive, and making the best return, all things considered, I should recommend to be first cultivated. During the dry season the colonists would also erect their houses and make a public road &c.; while the governor should be making purchases of land on the continent and among the Bijuga islands for future settlers; and in doing this he would meet with no great difficulty, as all the ground uncultivated by them is of no use, any further than as affording them the means of the chase. And indeed they are ever anxious to have white people settled in their neighbourhood, as when that is the case they always expect a constant supply of European

* It would be better undertaken by government, on whose account all the land should be purchased, which I think might be done for less than 5000 pounds; and grants of certain portions of it should be made to individuals at 10s. an acre. Now supposing the above territory to contain only 18,000,000 of acres, the whole when granted away, would produce to government 9,000,000L. sterling.

goods. In the mean time, while the cotton is growing, some small returns might be made to the mother country in the native produce enumerated in page 381.

"Having, in the first year, made two establishments on the island of Bulama, one at the east, and the other at the west end of it; the former of which is to be considered the capital of the colony; I should the next year form one on the Biatafa shore opposite to it; and another just to the westward of that branch of the Grande which runs up to Ghinala. These would be both on land already purchased of the natives; but, if the government at Bulama has been at all active, other territories will have been purchased in the first year; in which case I should form a third establishment at Bulola,* and a fourth in the isle of Galenas; so that at the beginning of the dry season of the second year, we should have six distinct establishments on this part of the coast. At the beginning of the third year, three, four, five or six other establishments might be formed on some of the Bijuga islands, or on some of those close to the continent, or, on the continent itself, north of the Rio Grande; and I should now consider the colony as sufficiently strong and permanent to require no further assistance from government.

"In the above outline, I have confined myself to the southern shore, but I think it would be as well, nay better, to begin the first year at both ends. In which case I should recommend the taking possession of James's island in the Gambia, and constructing on it a considerable fort; and the second year an establishment should be made on the Pasqua river.

"In establishing this colony there are certain points which must not be swerved from; whenever they are, the colony, if not ruined, will be retarded; these are:

"First, that no land be ever taken from the natives by force; and that we do not ever make a settlement without their consent. We should even re-purchase the land already bought rather than our right to it be disputed.

"The second is, that no person can be employed as a slave in any of our settlements, nor on board any ship or vessel belonging to the colonists. At the same time that the employment of slaves is prohibited to the European colonists, these must also be forbidden to interfere in the smallest degree whatever, with the employment of them by the native kings or chiefs, in their own towns or territories. Nothing must be done against their independence. The abolition of that execrable trade must be left to the gradual, but

sure, operation of reason, and example. Should we endeavour to prevent the native chiefs from selling slaves; so sudden, and so violent a check to one of their immemorial customs; the reason, the policy, or the justice of which it is impossible for them at first to comprehend, would ill dispose them towards us; and make them either treacherous friends or open enemies to the success of our undertaking; at the same time that not one slave less would be annually sold, notwithstanding our ill-advised and absurd attempts to prevent it; and by such means the slave trade never will be abolished. Whereas if these people are left to themselves, and to the operation of reason and example, without the smallest shock to any of their customs or prejudices, I question very much if a slave will ever be seen in any native town of the colony at the expiration of fifteen or twenty years. But if a misguided zeal for the abolition of slavery be manifested, it will tend to prolong its continuance, and the colony never can, and never will flourish. The absurdity of very well meaning persons, in thinking that they can overcome vices, customs, or prejudices, immemorably rooted in an unenlightened people, by shocking, instead of gradually enlightening their understandings, has done a great deal of mischief already. To begin by telling a native chief, the instant you have got into his country, that of his six wives he must put away five, because it is a great sin, and forbidden by the laws of God, to have more than one, will certainly astonish the chief, but will not induce him to part from his wives. As to the word sin, it is impossible that it can convey any idea to him; it is not within the limits of possibility for him to comprehend the idea which it is meant to convey; and of the laws of God he will have as little knowledge. But he will know that it is the custom, and ever has been, in his country, for every man to keep as many wives as he can afford; and that he is respected in proportion to the number of them which he maintains. Now to insist upon his parting from the cause of his respect, without assigning any comprehensible reason for his so doing, betrays a more barbarous mind than the one intended to be enlightened. If, after this, the same person goes on, and tells the chief, that drunkenness is also a sin, and that he must give up drinking spirits; in short, that he will not sell him any, nor suffer any to be sold to him for the future; the chief, who has been accustomed to drink spirits, and to see every one else do the same, when it was to be procured, will begin to think this European a little unreasonable; and will not be desirous of having him for a neighbour. But if

* Although Bulola is without the boundary line of the territory proposed to be colonized, being on the Naloo peninsula on the south side of the Grande, yet, from the character of its inhabitants, and their desire to have us established among them, I should there form a settlement; probably it might be thought wise to extend the southern boundary of the colony and carry it to the Rio Nunez, which is navigable for ships of 300 tons burthen, though with two or three bars, up to Kacundy about seventy miles from its mouth, between which place and Bulola on the Grande, there is frequent communication.

the European goes on, and tells him that he must change his religion and become a Christian, or else when he dies that he will be roasted like a yam, always in torment but never thoroughly done; this chief will probably inquire what he means by, being a Christian, that he may avoid this roasting. When his European instructor goes on from one dogma to another, all alike unintelligible in the present intellectual state of the chief, till he finishes with the doctrine of the Trinity, the belief in which, he tells this chief, is essential to his salvation: the latter, who thought him unreasonable at first, now thinks him * outrageously so; and that he is either a mad man, a fool, or an impostor; and to get rid of people professing such doctrines, will be his constant endeavour. Absurd as such conduct must appear, I have seen conduct towards a native chief yet more so; and much mischief has already been done by the fanatical zeal of some misguided people. I could give instances, but they are so incredibly extravagant, that they would scarcely find credit among sober minded people. If conduct like this be pursued in the intended colony, it will never succeed, and the condition of the natives will never be improved.

"It those Europeans who settle there are of industrious habits, and confine themselves to one wife, whose offspring they bring up with care and affection, the very habit even of imitation, (more particularly as it would be an imitation of people acknowledged their superiors in every thing) will in time, and that not very distant, introduce the same custom among the native chiefs, and from them it will descend to all others; and thus what the furious zeal of a bigot would have endeavoured to bring about in a day, a week, a month, or a year, at the expence of rudely attacking all their prejudices, but which he would never have accomplished, might gently and gradually be effected, and made to appear their own work, without our having in any instance wounded any of their feelings.

"As to drinking; if Europeans set them the example of sobriety, if they will not employ a drunkard, and always consider a man who has been seen in that state, as having dishonoured, and debased himself, they will soon confine that vice to a few of the lowest and most thoughtless of the people; who, by the bye, if they have the propensity, will not have the means of gratifying it.

"As to religion; there is much more danger of doing evil, than probability of doing good, by an excessive zeal for its introduction. In this, as in other points, example is much; if we are constant in our attendance at divine worship, and conduct ourselves there with decorum and reverence, this will have more effect on the minds of the Africans, towards

converting them to Christianity, than any thing that could be said by any fanatical zealot; and if we leave its operation to the slow workings of time, we shall certainly attain our object; which the folly of an enthusiast might only place farther from us.

"So of slavery. Interfere not with the natives buying or selling slaves; but let no European employ one. His grumetas, who till the ground for hire, must be reasonably paid, well fed, comfortably lodged, and have a little piece of ground to raise vegetables, and to keep poultry. These grumetas, unless they have a very unreasonable master, will be generally contented and happy; and if they have a good master they will never quit him; and generally speaking would risk their lives on his account. It would be seen in a very short time that these grumetas would annually produce more profit to their master, than if they had been all sold for slaves; nay, than if they could be all sold EVERY YEAR, whereas they can be sold but once.

"One great motive of the Africans in making slaves, indeed I may say the only one, is to procure European goods; slaves are the money, the great circulating medium, with which African commerce is carried on; they have no other. If therefore we could substitute another, and at the same time that other be more certain and more abundant, the great object in trading in slaves will be done away. This may be done by the produce of the earth. Let the native chiefs be once convinced that the labour of a free native in cultivating the earth, may produce him more European goods in one year, than he could have purchased if he had sold him for a slave, and he will no longer seek to make slaves to procure European commodities, but will cultivate the earth for that purpose; and he would be a gainer, even if the labour of one man should procure, annually, goods only to the amount of one half, or one fourth, of the value of a slave; because these he will have every year, the former he could have only once."

By consulting captain Beaver's excellent map, an instantaneous idea may be formed of the magnificence of this undertaking.

Mr. Malthus's book must have convinced the British public that population is always and every where progressive with the means of maintenance, and with them alone; that nations, which cannot provide a drain for their superfluous adolescence, must rebarbarize, and allow the brutal qualities of strength and courage to snatch the goods of life from the feeble hands of the industrious, the luxurious and the refined; that colonies, far from being

* If I may be thought to have spoken too lightly on subjects so serious, my apology will be found in the contempt and indignation I feel at the ill-directed efforts of those misguided and self-appointed missionaries. The language I use is such as must naturally suggest itself to their ignorant catechists. And the great truths of Christianity will be more exposed to ridicule than veneration, by the exercise of this "zeal without knowledge." Romans x. 2.

exhaustive of national force, or burdensome to public revenue, promote a wholesome emigration, and facilitate at home early marriages, manufactural demand, and domestic thrift; that with our power they extend our fame and influence, diffusing our exemplary arts of life, our multifarious occupations of profit, our traditional and recorded experience, enlarging the area of existence, and distributing the blessings of civilization.

The ancient world enrolled among its favourite worthies the founders of states; to their honor monumental cities arise; their ashes fertilize provinces.

Mr. Beaver wisely proposes to the government to buy these districts for its own account, and to grant the lands to individuals at a low quit-rent, increasable at definite periods. This is the best form of colonial taxation, and less likely to produce by its augmentation a dangerous discontent, than those monopoly-laws and navigation-acts, which check a direct intercourse with foreigners.

A time of war is the fittest for founding a new colony: few emigrants are wanted in the origin, and those not so much of the fighting as of the industrious class: the primary difficulties are thus overcome against the period when the redundant population of peace is ready to pour forth its shoals of recruits. A treaty

recognizes possession; whereas, during peace, wars are sometimes incurred by the attempt at new acquisition. We exhort the minister to put immediately at Mr. Beaver's disposal the means of enterprise: we doubt not his success: the risk and cost is small; the probable gain vast and lasting.

Out of deference for the practical virtues of the writer, let us not overlook the literary imperfections of his book. It is too thick: it abounds with repetitions: facts included in the narrative reappear in the journal: reflections incorporated with the history are brought out again in the speculative chapters. A more scholastic knowledge of natural history and botany would have rendered the same circumstances more conducive to the advancement of science, and also of the arts of life. Gardening and agriculture may be learnt by specific experience; but the manner in which they are practised being a result of the experience of ages, it is cheaper to follow tradition than to arrive at the same rule by fresh experiments. Yet in fitting out this colony no provision had been made to hire creole labourers in the West Indies, who might set agoing, in the established manner, the various processes of tropical agriculture. We recommend to the author some increase of library, and some extension of his literary acquisitions.

ART. VIII. *A Description of the Island of St. Helena; containing Observations on its singular Structure and Formation; and an Account of its Climate, Natural History, and Inhabitants.* 12mo. pp. 239.

A solitary, wild, and rocky island, rising in the midst of a vast ocean, which separates it from those continents on which its inhabitants must depend for the prime necessities of life, was not likely to have enticed many settlers from more opulent, fertile and independent regions; and although the situation of St. Helena, in the homeward track of our Indian ships, invites them to anchor in its harbour, few of the numerous visitors who touch at the island enjoy opportunity and inclination to examine with attention, and at leisure, its soil, structure, climate, and productions. Nor has St. Helena, like the rock of Malta and Gibraltar, had the good—or evil fortune to emblazon the page of history with high deeds of war or feats of chivalry. It has thus happened, that the descriptions which have been given of it are meagre, and rather general than in detail. Mr. Forster's is an exception.

If, however, this insulated rock allures not the historian by records of painful and protracted sieges it has sustained, or of

hard-fought battles it has won, it interests the naturalist by the curious geological phenomena presented for his examination, and is dear to the philanthropist as being the scene of a prosperous experiment, which in its issue, has utterly disproved the hardy and unfeeling assertion that the labour of the negro must be enforced by the lash, and can only be secured in the mute and sullen obedience of slavery. Sir George Staunton, who stopped there in his return from China, mentions this fact, to the honor of the East India company, in his account of Lord Macartney's embassy. (vol. 2, p. 600). St. Helena is chiefly cultivated by blacks, who were brought thither as slaves by the first European settlers, the Portuguese. They continued under the unlimited dominion of their owners, till, in consequence of a representation made to the English East India company, many regulations were enacted in their favour, and they were placed under the immediate protection of the magistracy. Before these regulations

were adopted there was an annual average loss of ten slaves in the hundred, and since that time the race has considerably increased in consequence of the comfort and security they enjoy.

Besides the blacks in a state of slavery, there are some who are free: the labour of these latter diminishing the value of the former, the free blacks became obnoxious to the slave-holders, who had influence in a grand jury to represent them as without visible means of gaining a livelihood, and consequently liable to become burdensome to the community. On examination, however, it appeared, that all the free blacks of sufficient age to work were actually employed, that *not one* of them had been tried for a crime of several years, nor had any of them been upon the parish. The English East India company has accordingly placed them nearly on a footing with the other free inhabitants; and the importation of slaves into the island is prohibited.

St. Helena derives its name from the circumstance of its having been discovered on St. Helen's day by the Portuguese, in 1508: the English obtained possession of it in 1600, and in 1673 the Dutch took it by surprize. It was retaken, however, the following year, in a very gallant manner, by captain Munden, who also captured three Dutch Indiamen, which were in the roads, and the island has from that period remained in the hands of the English East India company.

It marks the natural sterility of the island, that, on its discovery, it was destitute of human inhabitants, that it was without quadrupeds, and almost without birds; 'for excepting some species of sea fowls, which still hover about its coast, and the man-of-war and tropic birds, which annually resort thither to build their nests in the cliffs, no other kinds seem to have found their way through the vast solitude of the ocean to this remote isle, which was only covered in a few places with some indigenous shrubs and plants, and these neither numerous in their kinds nor very abundant.'

The whole structure and composition of St. Helena indicate volcanic agency; and whether or not we accede to the theory of its origin and formation, deduced from a careful examination of its materials and the arrangements of them by the author of this little tract, it will be impossible to withhold from him the praise due to his scientific research and ingenuity.

The loftiest range of hills in St. Helena runs in a central line from the south-west to

the north-east, forming an elevation from two thousand to three thousand feet above the level of the ocean. Throughout the island their declivities present a stratified appearance, showing at different heights a great variety of tint and colour. The layers consist of basaltic rock, placed alternately with deep beds of volcanic matter, and layers of clays; they have moreover an uniform tendency, even where the masses of rock are most wild and irregular, to assume the columnar form; consisting of perpendicular portions of rock, separated from each other by vertical fissures, and generally also intersected by horizontal ones. Towards the summits these columns are sometimes oblique, and not unfrequently curved: the central parts of the rock are compact and of an uniform texture, but at the extremities, that is to say where it terminates, either in the bed of volcanic matter or of clay, it is commonly scorified, flaky, and honey-combed; the scorified parts oftentimes presenting the appearance of recent ignition, being quite black and scorched. This cellular appearance, though generally confined to the summits and bases of the rock, is sometimes found in the center of it: in a quarry, situated in the interior of the island; the stone, when broken, exhibits large cavities, containing a fine and wholesome water.

The intermediate layers of clay and of volcanic matter, which, like the strata of rock, vary in depth sometimes abruptly, sometimes with insensible gradation, correspond in several respects with the appearances of the basaltic columns: they occasionally present the columnar form, are found to consist of concentric lamellæ, whose interior surfaces are tinged with a variety of rich colours, and are oftentimes found regularly fissured, separating into uniform and angular portions.

A remarkable difference is observable between the exterior and interior of the island; in the hills that border on the sea the clays only appear in thin layers, interposed at different heights between the beds of basalt; the interior hills, which as has been already observed, are much loftier, are composed principally of clay, interspersed with some beds of the same basaltic rock and the same volcanic products as near the shore.

Among these argillaceous hills more particularly, it is to be observed, that besides the horizontal strata of which the hills chiefly consist, they are all penetrated by huge perpendicular strata of loose and broken rock, red, grey, or blue, re-

gularly fissured, the fragments in many places being quite separate and distinct. The fissures in the vertical strata are often in the direction of the stratum itself, and in some places separate the whole mass into perpendicular columns, which are again transversely subdivided by horizontal fissures. As in the lapse of time the softer parts have crumbled and fallen away, some of these vertical strata rise to a great height above the summits of the hills, exhibiting, together with some insulated masses of broken and precipitous rock, a most wild and dismal picture. No sand is found on the coast, except at one place, which, on that account, is called Sandy Bay; nor did our author meet with any granite; but the whole surface of the island is overspread with a vast quantity of loose fragments, consisting of splinters of the blue basaltic rock, intermixed with light, spongy, porous, and honey-combed stones, very various in their colour and specific gravity. From all these appearances he conjectures—in opposition to Mr. Forster's opinion, that St. Helena as an island or fragment of some ancient continent, existed above water before it became the seat of a volcano—that the whole is a volcanized mass, raised by successive eruptions from the bed of the sea. Not that St. Helena was raised above the waters of the Ethiopic, by the resistless violence of one vast explosion; such a supposition is incompatible with the regularity of its appearance: we might, says our author, as easily believe, that an earthquake could raise a city without throwing down its buildings, as to imagine that the hills of St. Helena could have been suddenly raised three thousand feet, without disturbing the position of the broken, loose, and hanging rocks, of which they consist.

“It seems not likely, that the perpendicular and oblique strata of broken and fissured rock, which pass through the volcanic beds, could have existed before the formation of the hills, which support and keep them together in their present position; and it is impossible to conceive, that the parallel horizontal layers, and those that cross them, were the effect of operations, co-existent and simultaneous. Whence it will follow, that the elevation of the perpendicular strata, and of the numerous oblique ridges of stone which intersect the hills, must have taken place at some period subsequent to the elevation of the island itself.

“From all this, the most probable conclusion seems to be, that the various matters, composing the parallel layers of the hills, have been successively accumulated by volcanic eruptions: that these matters, on cooling and

hardening, not only became fissured and cracked in the manner we find them, but that, in many places, the hills themselves were affected with larger rents and chasms, from the same causes: that all these rents and chasms, as well as the craters, were afterwards filled up with explosions of liquefied matter from below: that this liquefied matter, which, upon cooling and contracting, would also naturally become fissured and broken, as we see it, has formed all the perpendicular strata of rock, and the oblique ridges that cross the hills. This opinion seems conformable to every appearance which we meet with in the island; for all the beds and layers, which compose the main bulk of the hills, are unquestionably volcanic; and in many places disposed, as we should expect, by matter issuing from the mouth of a volcano; and on the spot where we should naturally look for a crater, we sometimes find an angular or conical mass of stone, or a huge vertical stratum, dividing the hill into two equal segments. As the clays and coloured earths would be more subject to rents and fissures than the stoney matter, we accordingly observe, that the argillaceous hills, more than any other part, are penetrated by vertical strata of rock, and intersected throughout all the declivities with numerous oblique ridges of cracked and shivered stone. From the loose texture of all these vertical strata and oblique ridges, and of the insulated and perpendicular masses of stone, it seems evident, as has been previously observed, that they must have acquired all their cracks and fissures, while in their present situation; as they could not possibly be displaced, without a total disruption of their component parts: that consequently, they must have been elevated, while in a soft and liquefied state from the effects of heat; and that afterwards, upon cooling and contracting, they became split and fissured in the manner in which we find them.”

From whatever convulsion of nature St. Helena may have been formed, no appearance of any active volcano is now to be seen; no shocks of earthquakes are felt here, nor are any sulphureous, bituminous, or inflammable matters discovered; whatever fires may have once existed, have for ages been extinct. The climate is salubrious, and the temperature, for an island within the torrid zone, is moderate, the medium heat being about 69, and the range of the thermometer, for the period of a year, from about 52 to 84. It has no wind but the trade wind; is never visited by hurricanes, and one may reside on it for several years without observing the phenomena of thunder and lightning. The hills and valleys, as they approach the coast, are alike sterile, while the loftier summits of the central ridge are covered with the most luxuriant vegetation; thus, apparently is inverted the ordinary course which nature is observed to pursue. The

fact, however is, that a large proportion of the little rain which falls upon the island descends on the interior mountains; which from the superior loftiness of their summits, are conjectured to intercept in their course the lighter vapours of the trade-wind, which accumulate till they acquire a sufficient density to be precipitated in the form of rain.

The author of this little tract has endeavoured to explain and illustrate some of the peculiarities of climate in St. Helena, by comparing them with those which exist on the peninsula of India. From its loftiness and lonely situation, exposed to all the exhalations of a surrounding ocean, in a warm climate it might have been supposed that St. Helena would rather have suffered from a superabundance than a deficiency of rain. The causes assigned for the severe and excessive drought which sometimes afflicts this island, and for the general deficiency of moisture which prevails there, are—1. The great uniformity of the temperature and the constancy of the trade wind. In the Carnatic several months pass without a shower; 'during this period the weather is serene and the winds steady and uniform; and so small is the difference between the temperature of the night and day, that there are no perceptible dews, for the atmosphere in such a state does not part with its latent moisture.' Yet in this situation extraordinary degrees of heat and closeness are invariably followed by storms and showers, as also are the concussion of opposite and the intermission of periodical winds.

"While Nature thus relieves the extraordinary heats of India, by the gathering and dispersion of heavy storms, she mitigates and counteracts the sultriness, incident to some particular seasons, by the effects of frequent showers. It is surprising how regular this course of things is, at some periods, especially in the close months of April and September, when it is not unusual for rains to occur every afternoon, if the heat and sultriness of the day have been considerable. Yet rains, at this season, never take place in a morning, and very rarely at night. The afternoon showers seem to be the effect of each day's heat, and proceed from clouds, which collect and discharge themselves within the visible horizon. For a considerable time after sun-rise, no clouds are to be seen; but in the heat and closeness of the forenoon, small specks are observed to gather all round the lower sky, and not in the direction of any particular wind. These increase in size with the increasing heat of the day, and coalescing, form a continued belt or zone all round the horizon. This, in the afternoon or evening, blackens in different parts, and falls in rain. Sometimes

the whole produces rain; though this, in general, is confined to particular quarters, from some one of which the lightning breaks forth, and the wind shortly after taking its direction from the same point, blows delightfully cool and refreshing. After sun-set, these clouds subside beneath the horizon; and the night is bright and starry. This succession of appearances frequently lasts for several weeks together, during which the mornings are always fair, the afternoons cloudy, the evenings showery, and the nights clear."

Thus it is in St. Helena: the rain usually falls at the hottest or coolest time of the year, that is to say, when the temperature varies the most considerably from the surrounding sea; the greater coolness of the trade wind in the one case evolving the latent moisture from the heated atmosphere; and in the other, the greater coldness of the summits of the hills condensing the exhalations borne to them by the trade wind.

A second cause assigned for the immoderate dryness of St. Helena, is the want of land and sea breezes, and of regular periodical winds blowing from opposite quarters. The change, or breaking up, as it is called, of the monsoons, which prevails in most tropical regions, is generally accompanied with rain: the equilibrium between the temperature of the ocean and the land is destroyed. The destruction of this equilibrium is also produced by the diurnal alternation of the sea and land breezes: the wind from the sea blowing cool in the evening on the exhalations and vapours of the land, condenses and converts them into rain; and the land breeze, when it blows chill towards the morning, in like manner produces showers on the surface of the ocean.

A third cause is the small size of the island, and its distance from other lands; and the fourth, the nakedness of its surface, which had it been well-wooded, might, from its elevation, have arrested many passing clouds which now fly over it, and have converted them into rain. These causes require no illustration.

That the island of St. Helena may be converted from its present dreariness and desolation there is good reason to believe, from the auspicious growth of some vegetable productions which are indigenous both in hotter and in colder regions. From want of care and want of foresight, it has happened, that in many parts of the island where wood was formerly cut by the inhabitants for fuel, no vestige of vegetation is now seen. St. Helena abounds with excellent water, and in its harbour ships may always ride in safety: its cli-

mate too is of such singular salubrity, that the sickly crews of ships which touch there very shortly recover, and of the invalids who are discharged from the different regiments of India, and sent home as incurable and unfit for service, many, during their stay among the health-breathing hills of this island, recover so fast as to enlist again and enjoy a renovated constitution. The atmosphere is unruffled and serene, and free from noxious vapours: malignant and contagious fevers are unknown, nor has the small-pox ever found its way to St. Helena.

As the island, therefore, is in every respect of infinite importance to the interests of the East India company, it is to be hoped they may attend to the suggestions thrown out for its improvement in this valuable, unassuming little volume. In what degree, during a lapse of years, the aridity of the atmosphere might be corrected by spreading vegetation over mountains now desolate and barren, can only be ascertained by the success of the experiment itself. A society was established in St. Helena some years ago, which had for its object the cultivation of various exotics in different parts of the island: had the resources of this laudable society been equal to the promotion of its views, there is every reason to infer, from the actual success which crowned their labours, that the consequences would have been most beneficial. As it is, however, the general improvement of the island is neglected: the want of inclosures leaves young plants unprotected against the injuries of goats, which nibble off the shoots, and a scarcity of fuel induces the inhabitants to employ for present necessities those stores which ought to be preserved for the future.

Of indigenous shrubs and trees there are not above nine or ten different species: among these are the fern, which grows to twenty or twenty-five feet, the cabbage tree, two or three different sorts of gum trees, the ebony, the aloe, and the aromatic string-wood tree. Of the smaller vegetable productions, the principal indigenous ones, besides some species of grapes, are endive, purslane, samphire, wild celery and water cresses. Exotics from the most opposite climates, from Britain, Africa, China, India, New Zealand, New South Wales, and America have thriven here luxuriantly: the oak, chesnut, ilex, bamboo, palm, weeping-willow, cypress, orange and apple-trees and plantain. Scotch firs grow vigorously: the cherry, the pear and the gooseberry do not suc-

ceed; the peach, which was formerly the most abundant fruit on the island, has been almost entirely destroyed by the inexorable ravages of a microscopic insect, which has hitherto bid defiance to every attempt for its extermination.

The first step suggested to the Company's consideration towards the improvement of this island, is to secure shelter for young plants by enclosures, and to obtain an artificial command of water, much of which now runs to waste. On so uneven a surface as that of St. Helena, nothing can be more easy than to intercept by tanks and reservoirs, those numerous springs which issue from the hills, and to distribute the fertilizing streams over thirsty, parched-up grounds. As St. Helena is unfit for the production of corn, and its inhabitants are of course dependent on other countries for the prime necessities of life, those trees should be cultivated with peculiar care, which would afford the surest resource against scarcity. The various sorts of palm, (which are entirely neglected) and particularly the cocoa-nut, should be encouraged: these trees, the growth of tropical climates, are of inappreciable value. The todda panni, and the coddia panni of Malabar, are both recommended: the pith of the former is made into bread, and the leaves are so large that one of them plaited will protect a dozen people from the sun or rain. The palmyra is a hardy palm, affords a durable timber, and grows out of the dead sand on the coasts of Malabar and Coromandel. The bread-fruit tree might also be tried. The jack, or *artocarpus integrifolia* is a tree which yields a very nutritious, and at the same time the largest fruit in the world; it affords also a beautiful timber resembling mahogany, and from its thriftiness in Tanjore on a similar soil, gives reason to believe that it might thrive on the argillaceous hills of St. Helena.

"It is a singular circumstance respecting this tree, which is, perhaps, not generally known, that it produces its fruit at the same time from the boughs and stem, and from that part of the trunk which is under ground, where the natives find it upon digging. The fruit, dug up in this way, is reckoned the best, and the time of its maturity is known, from the ground over it cracking and opening. This tree, which is one of the most beautiful and useful in the universe, has not been long known to European botanists. Its foliage is very close and shady, and the leaf bears some resemblance to the laurel. The fruit is of a most extraordinary size, and contains a wholesome and sweet pulp, interspersed with small

kernels called jack-nuts, of an exquisite flavour and nutritious quality. The natives of some of the hills of India use these kernels as bread.

"The Mahwah tree, which grows in the sandy deserts of Bahar and Orissa, and by supporting the severe droughts of that climate, supplies a seasonable subsistence to the inhabitants, seems well calculated to bear the less parching droughts of St. Helena, and ought to be introduced here."

The teap and the poon are also advised to be tried here, and more particularly that monarch of the vegetable world, the banian; these, together with various artificial grasses, might cover the surface of the soil, and contribute to arrest the fall of those loose crags which impend over the vallies, and are oftentimes precipitated from their parent rock.

Among the animals which have been introduced into St. Helena—for on its discovery it was destitute of any living thing, except a few oceanic birds—are to be mentioned horned cattle, which are numerous and well-flavoured; goats which are very abundant; sheep, poultry, and game. Horses are a hardy breed, and well adapted to the craggy and precipitous roads they have to traverse. The inhabitants have to contend against a multiplying breed of rats, which, together with caterpillars, and the insect whose ravages are directed against the peach tree, swarm in incredible numbers, to the great detriment of agriculture and gardening.

St. Helena, the circumference of which is only eight and twenty miles, contained about two thousand souls some years ago, five hundred of whom were soldiers, and six hundred blacks. What its population is at present the writer of this tract had no opportunity of ascertaining: there are about seventy garden houses, and few families are without one, in which they reside during the summer season, namely, from October till April or May. There are no professed inns on the island, but hospitality is to be purchased at every house: the arrival of the homeward-bound India fleets is, of course, a season of the greatest festivity and joy. Plays, dances, and concerts recreate the way-worn passengers, and St. Helena on these

occasions displays a large and lovely group of beautiful young women. In so salubrious a climate, longevity must prevail: the females are prolific, their labours easy, and their offspring healthful.

"But it deserves particular notice, that the number of females born here, is said to exceed that of males, which also happens at the Cape of Good Hope: and, if the writer is not greatly mistaken, in the East Indies. The number of males born in Britain is known to exceed that of females; and this is probably the case in all northern countries. Now if it be really true, as there seems reason to suspect, that there is a greater number of females born within the tropics, and of males towards the polar regions, the fact is well worth the attention of philosophers, as the illustration of it might enlarge our views of the order and design of nature, in discovering why she thus varies, though by means utterly mysterious and unknown to us, the proportion of male and female births in opposite circumstances of climate, for the purpose of perpetuating the race of mankind?"

It will be recollected that Mr. Bruce has defended against the holy conclave of moralists, Mahomet's permission of polygamy on the principle that in eastern nations more females are born into the world than males. In the south of Mesopotamia, Armenia, and Syria, from Mousul or Nineveh to Antioch and Aleppo, the proportion appeared to be fully two to one. From Latike (Laodicea, *ad mare*) down the coast of Syria to Sidon, the number was nearly three to one. It was the same through the Holy Land and parts of the Delta: but from Suez to the straits of Babelmandel, which contain the three Arabias, it was four women to one man; this proportion he imagined held as far as the line, and to 30 deg. beyond it.

Although the final cause, therefore, of such a disproportion may elude our investigations, the fact, if it is ascertained to be one, facilitates our researches into the national manners, and religious institutions, of far distant countries.

After the ample notice we have taken of this little tract, it is unnecessary to say that it indicates in its author a cultivated and philosophic turn of mind; the style in which it is written is perspicuous and energetic.

ART. IX. *Travels through Italy in the Years 1804 and 1805.* By AUGUSTUS VON KOTZEBU. 4 Vols. foolscap 8vo.

OF all the travellers which it has been our lot to fall in with, this Kotzebus is the most egregious; his trifles, however, have been so well received by the public, that he now considers himself the arbiter of

taste, and supreme judge of merit in the affairs of men. With a hop, skip, and jump he passes from one corner of the continent to the other, inspector-general of states and empires, and delivers in his re-

port to the world with the same confidence that would have inspired him had he been delegated to the task by a general congress of European powers! What serves as a preface to these volumes commences in as arrogant a manner as the periest coxcomb could have adopted. 'A list of those who are not to read this work: first, All artists; or judges of the arts, as they are termed: unless they find any pleasure in giving their shrugs of compassion every moment. For as *they* consider the arts as something fixed, but *I* as something daily new; *they* as the mere creation of form, but *I* as the transfusion of mind; *they* as proving the expertness of the eyes, but *I* as the occupation of the soul; the *form* being with them the first, but with me the last thing,' &c. &c. What stuff this is, and how disgusting! Kotzebue is a man of genius, and certainly no inattentive observer: we object against him that he is pert and familiar, and self-sufficient, seeming to stop his readers every now and then and say, 'Is not this a smart thing?' or like the old battered bequ in a caricature—'John! do the ladies admire me?'

After ridiculing the indiscriminate custom which prevails in Germany of strewing flowers in festive and in mournful solemnities, a custom, by the way, simple, elegant, and of classic origin, Kotzebue says, that in Eastland and Livonia it is usual to strew the path on which a corpse is to be carried, with branches of fir: his remark on this custom is, that 'it is a real advantage for the bearers and the followers on foot: for when the streets are dirty they are thus rendered passable, or when the snow lies deep their feet are at least defended from the wet!' Such a remark might well have come from the mouth of some buffoon in one of his own plays. It would cost us no trouble to select others equally silly, but it is an ungrateful task to censure—we take no delight in it. Let us rather avail ourselves of what is to be found curious and interesting on the present state of countries, the face of which has been completely changed within the last ten years. Italy and the Tyrol are at this moment the seat of war: like all mountaineers, the Tyrolese are an active and brave people: in their pursuit of the chamois goat they scorn all danger and all hardship, and are such admirable marksmen that their services as sharp-shooters in the last war were rewarded with the temporary liberty of hunting with impunity. The value of this liberty can only be estimated by those who know the pas-

sion of the Tyrolese for the chase; a passion, says Kotzebue, more violent than that of the gamester. Neither threats nor punishments can deter them from the pursuits of it; gain is not the object, for the goat, flesh and skin, does not sell for above ten or twelve florins, and yet a man who had been many times caught in the fact declared, that if he knew the next tree would be his gallows he would nevertheless hunt. M. de Saussure records an interesting anecdote of a chamois hunter whom he knew; he was a tall well-made man, and had just married a beautiful woman; 'my grandfather, said he, lost his life in the chase, so did my father, and I am so well assured that one day or other I shall also lose mine, that this bag which I always carry with me in the hunt I call my winding-sheet, for I shall certainly never have any other; nevertheless, Sir, if you were to offer me a fortune immediately, on condition that I must relinquish the chase, I would not accept it.' De Saussure says that he took several excursions among the Alps with this man; his strength and agility were astonishing, but his courage, or rather his temerity, still greater than either: about two years afterwards his foot slipped on the edge of a precipice, and he met the fate he had so calmly anticipated!

At Inspruck Kotzebue witnessed the dexterity of the Tyrolese sharp-shooters; he says, that of ten or twelve shots, eight at least entered the bull's eye, not a single one missed the target; and the man whose business it was to mark the place where the ball had struck, was so certain of no one's shooting wide of the mark, that he often continued standing near it during the firings.

From Inspruck we proceed to Florence, Rome, Naples; at the time of Kotzebue's visit to the first of these cities the yellow fever raged within its walls, and of course made him eager to flee from the pestilence: he has contrived, notwithstanding, to fill a few dry pages with the names of churches, and of some of the pictures and statues in the gallery. He says, that in the year 1800, the Florentines had the precaution to convey their most remarkable statues and pictures to Sicily for safety, but when the storm blew over they were all returned in good condition. This precautionary measure was adopted rather late, for in the year 1800, if we mistake not, they were most of them at Paris.

A great and general outcry has been made against the French for their plunder of Italy, for their seizure of all the valuable specimens of art, and transportation

of them into France; as if the law of nations drew a circle of security round these precious reliques of antiquity? As if the conquerors did not display before the eyes of Europe a more cultivated taste than if they had contented themselves with the plunder of Italian coffers? And as if the French had not actually followed the example of the Romans themselves, who adorned their capital with the spoils of Greece, of Syracuse, of Carthage, and, in short, with those of every city which submitted to their arms? From a fact incidentally mentioned by Kotzebue, in his notice of the gallery, we may suspect that the Florentines will not grieve long for the loss of their statues: 'Venus of Belvedere formerly held an apple in her hand, but when Venus of Medicis went on her late pilgrimage, it was wished to commemorate her by breaking off two arms of this Venus, and substituting two new ones with the bend of the Medicean. It now makes a droll appearance.' In such estimation is a supposed work of Phidias held at Florence! This reminds one of an anecdote recorded of Mummius, who, when he had conquered Corinth, and stripped the city of all its choicest specimens of art, threatened the soldiers who conveyed them to Rome, that if they broke any they should be compelled to replace them with others! Who does not regret that the Venus of Belvedere did not find an asylum against this violation by unholy hands, in company with her Medicean sister, at the Louvre?

NAPLES. Kotzebue's *forte* is in delineating living manners; he catches a few striking traits of character, and illustrates them with little descriptions and anecdotes. Like all other travellers in Italy, he seems to imagine that none of his readers can possibly know any thing about Roman antiquities: the number of superfluous pages devoted to architectural remains, which have been described a hundred and a hundred times before, makes a large proportion of these volumes tiresome in the extreme. For the relief of our readers we shall pass these over, and advise Kotzebue's readers to do the same: in describing the museum at Portici, which contains an assemblage of those works of art which have been recovered from the subterranean cities of Pompeii and Herculaneum, Kotzebue has given an interesting account of the progress which is making (under the munificent patronage of his Royal Highness the Prince of Wales), in the development of ancient manuscripts.

"The most remarkable objects in the mu-

seum at Portici, are the manuscripts found in two chambers of a house at Herculaneum. Though they have been so frequently described, they must be seen to furnish a correct idea of them. They resemble cudgels reduced to the state of a cinder, and in part petrified; are black and chestnut brown; lie in many glass cases; and unfortunately are so decayed, that under every one of them a quantity of dust and crumbs is to be perceived. Being rolled up together in the manner of the ancients, and perhaps also gradually damaged by the moisture penetrating through the ashes, it appears almost impracticable ever to decypher a syllable of them. But for the industry and talent of man nothing is impossible, and his curiosity impels him to the most ingenious inventions.

"The machine by which the manuscripts are unrolled, is of such a nature that I despair of describing it clearly. It resembles, yet only in the exterior, a bookbinder's frame on which he usually sews his books. The manuscript rests on some cotton in the bow of two ribbands; with one end fastened above in cords, exactly like the curtain of a theatre. Goldbeater's-skin is then laid on with the white of an egg in very small stripes, by means of a pencil, in order to give something to hold by. To this skin silk threads are fastened; which, together with the ribband, wind above round the peg, in the same manner as the string of a violin. When the workman has, with the skin, laid hold of however small a part of the manuscript; and, by means of a sharp pencil, has loosened the first leaf as much as possible; he turns the peg with the greatest precaution, and is happy if he succeeds so far as to unroll a quarter of an inch: upon which he begins the operation afresh. It must not, however, be imagined that this quarter of an inch, which was undone with such infinite difficulty, remains a connected whole. Not at all: it rather resembles a piece of tinder that is full of holes.

"After the workman has gained thus much of the flimsy leaf, he carries it, with his breath held in, to a table, and gives it to the copyists. These men must be very expert in distinguishing the letters. Their task is not only transcribing, but drawing: for they copy the whole leaf, with all its vacancies, in the carefullest manner; after which a man of learning tries to supply the parts that are wanting. These supplements are, of course, very arbitrary. There is scarcely a line in which some letters or words are not wanting; often whole lines, or whole periods, must be filled up. What a wide field for conjecture! What is thus supplied is written in red ink, between the black; we may therefore instantly perceive at first sight, how much belongs to the original, and how much has been added. It is said that the manuscripts are also to be printed: in that case I anticipate how the linguists of Europe will employ themselves in cavilling, each in his way, at the supplies which have been thus made, or substituting others in their room.

"The endless trouble which the whole

most occasion, may be conceived. It was some time ago nearly laid aside, as every thing else is here; but the Prince of Wales has taken it upon himself, and defrays the expences without giving offence to the royal sportsman of Naples. Eleven young persons unfold the manuscripts, two others copy them, and a meritorious and zealous Englishman named Hayter, has the direction of the whole. He assured me that the persons employed began to work with greater skill and expedition than some years ago. He by no means despairs of decyphering all the six hundred manuscripts still extant; and does not doubt of finding a Menander and an Ennius, as he flatters himself with having already found a Polybius, in his work. The very day before I visited the museum, he had discovered an unknown author, named Colotos.

"His business requires a philosophical temper. As the name of the author is always put on the last page, he cannot know whose work it is till that leaf is unrolled. Seven Latin authors have fallen into Mr. Hayter's hands; but unfortunately all in such a state that it was not possible to open them whole. He complained the more of this, as there appeared to be among them a work of Livy's; at least, it was certainly an historical work written in his style, and began with a speech in which much was said of a family of Acilius. Unfortunately no more could be made of it. Mr. Hayter lamented that the first person to whom the manuscripts had been entrusted (a Spaniard named Albuquerque) had thrown them all together; for he himself thought that they might have been of various merit in the different chambers in which they were placed.

"At present five writers have been discovered: Philodemus, of whom the most works have been found, and among others a treatise on the vices which border on virtues—certainly a very copious subject, if it has been discussed with ability; Epicurus: Phadrus; Demetrius Phalereus; and now Colotos. Mr. Hayter is not perfectly satisfied with finding nothing but philosophical works; yet he says that even in these many historical notices yet unknown are interspersed. There is, for example, a treatise on anger, containing an instance in which Bacchus punished Cadmus for indulging that passion; a circumstance of which we were never before informed. All travellers interested for the sciences, will catch (as I did) with eagerness every word from the mouth of the meritorious Hayter, and join with me in wishing him health. He is fully possessed of every other requisite qualification.

"In a fresh conversation with Mr. Hayter, I have learnt that the manuscript of Colotos lately found contains a refutation of Plato's treatise on friendship. Mr. Hayter has also traced the name of Colotos in Plutarch; who has written against him, as he has against Plato. Thus it was the same with the ancient philosophers as with those of our times.

"A new and important discovery has been made within these few days. The writings of Epicurus have hitherto been found only in

detached parts, but now they have been met with all together. This manuscript is in the best state of preservation, and Hayter will now be able to rectify his own former supplements by the original. It must be extremely interesting for an intelligent man, to be able to ascertain in such a case whether he has properly supplied the sense.—A hundred and thirty manuscripts are either actually unrolled, or unrolling."

It is impossible to be at Naples without visiting Vesuvius: Kotzebue had the good fortune to witness the eruption which took place on the night of Nov. 22, 1804, and he has described it with much less dramatic sentimentality and parade than we expected. There had been no formidable indications of an eruption since the year 1794, when fourteen lives were lost, and many families were ruined by the desolation, until in the early part of this year (1804). Three earthquakes were felt at Somma on May 22d; on the 31st of July the water had visibly diminished in the rivers and cisterns of the neighbourhood; on the 11th of August Vesuvius begun to bellow, and on the thirteenth a stream of lava, accompanied with flames and stones, burst forth from a new-formed gulph. Since that period, Vesuvius had not been at rest, and an approaching eruption was apprehended, which took place Nov. 22. No mischief of much consideration resulted, except to the character and person of St. Januarius, whose image, when the lava threatened to overwhelm the vineyards, was, as usual, carried in procession in Torre del Greco, and placed before the lava; immediately the people began to kneel before his saintship, and pray that he would be so good as to stop the progress of the flood—the flood rolled on! The saint was placed a little farther back; prayers and prostrations were repeated with increased vehemence and devotion—but the flood rolled on! At length the people, finding that Januarius was utterly inexorable, began to abuse him; they called him an old rascal, hypocrite, and every other name which indignation prompted. From words they actually came to blows, and the sides of Saint Januarius were villainously belaboured, particularly by an old woman, who had no mercy upon him. The fact however was, that St. Januarius had previously lost credit among the Neapolitans by condescending to let some of his blood liquefy in the presence of the French; on this occasion they called him a jacobin, and it is even said that a criminal prosecution was commenced against him for the offence. St. Anthony has profited by the disgrace of his rival, and

is now in very high repute! It is really painful to dwell on such instances of infatuation; these are the debasing effects of superstition, engendered by the craft of the priest upon the ignorance of the people.

The manners of the Neapolitans appear to have suffered but little alteration within the memory of man! the only *new* feeling which possesses them is a bitter and a rooted hatred against the French. It is entirely superfluous to remark, that wherever the French have set foot, this deadly detestation has been excited. The Neapolitans, from high to low, are ignorant, lazy, superstitious, and debauched: they are irascible and revengeful; an injury must, if possible, be revenged on the spot, and, if possible, by the stiletto. Kotzebue, however, says, that the habit of stabbing each other in the breast with knives on the slightest quarrel, no longer prevails. The frequency of assassination has been repressed by the vigorous ordinances of the duke of Ascoli, to whom the Neapolitans are under various other high obligations.

Nothing can exceed the stupid superstition of these people; we have already given an instance of it; another is at hand. It is a good custom in Naples for cows to be sent about from house to house; whoever wants milk sends out a servant, and he milks the animal before his master's door. But besides these cows, a number of calves wander about the city belonging to the monks of St. Francis, a set of crafty, idle impostors, who not only live themselves, but get a living for their stock also, upon the folly of the people. 'For this purpose they put a small square board on the forehead of the calf, with the figure of St. Francis painted on it: provided with this, the animals walk about uncontrolled, devour as much as they can, and sleep where they choose without any one venturing to prevent them. On the contrary, if one of them should happen to enter a great house, and lie down there to sleep, the occupier thinks it a fortunate omen!'

Gaming is carried to as great excess as at Paris, and prevails as generally among all classes of people: the dissoluteness of the female sex seems to surpass that of the Parisians. Infidelity does not prevail in Paris as it does in Naples: the cicisbeo exists no longer as a centinel to give the suspicious husband notice. From Italian jealousy the stranger has no longer any thing to dread. Take an instance of con-

summate, but according to Kotzebue's account, not unparalleled depravity:

"A duke who was esteemed the handsomest man in Naples, married an amiable woman of unblemished reputation, and who to his own astonishment remained when a wife still amiable and irreproachable. The duke, however, became dissatisfied; and paid his addresses with great fervour to a princess, whose name, together with that of her lover, I shall omit. He succeeded in obtaining favour with the new object of his passion, but *only* on one express condition; that as long as their connection lasted, he should live with his young and lovely wife merely as with a sister. He promised every thing; but he found this more easy than obeying, for a living evidence of his defalcation too soon appeared. The princess raved, and would hear nothing he had to say. In this dilemma he asserted that he was not the father of his wife's child. The princess started: for a married man to load himself with such a reproach, confounded even her for a moment. Yet her jealousy demanded stronger proof; and he promised all. 'If the child is not yours,' said she, 'send it immediately to the foundling-house.' The duke left her, and sent his child thither accordingly; regardless of the agonies of the mother, of whose innocence all Naples remains convinced to this day."

To crown the whole, the Neapolitans, in their revolutionary frenzy, committed excesses not surpassed in savageness and atrocity by the Parisian populace; every one, says Kotzebue, still relates with horror, that the Lazzaroni roasted men in the streets, and begged money of the passengers to purchase bread to their roast meat! The royal library at Naples has been enriched, *pro tempore*, it is apprehended, by MSS. from the Vatican, which the Neapolitans took from the French at Rome. Kotzebue frequently attended the library, and, from his account, it seems to contain a great variety of manuscripts, which would amply reward the careful examiner, on subjects connected with history and science.

ROME. A more active and voluble Cicerone is not to be found in all Rome than Kotzebue himself: theatres, temples, baths, palaces, porticoes, &c. &c. succeed each other in description, till the wearied reader begs an interval of repose. Rome yet continues to be the resort of artists from all parts of Europe, and notwithstanding their plunder of Italy, the French have a great many pensionary pupils there. Kotzebue runs through the galleries of living as well as of departed artists, and delivers his opinion on their respective

merits with a degree of freedom and confidence which somewhat startles modest men. At the name of Canova he is all on fire; the burst of his enthusiasm is perfectly dramatic. The workshop of Canova is the richest in Rome, and, notwithstanding that 'the manufacturers of just proportion' shrug their shoulders, he is asserted to be the greatest sculptor that has existed since the days of Phidias. His statue of a Venus, covering herself with a light robe, bears some resemblance, in point of proportion, to the Medicean Venus: our enthusiast says that, in this respect, Canova's statue is far superior, and 'cannot be charged with that confoundedly stiff position of the arms which the other appears to have learned of a dancing master!' It is a lucky thing for the Belvedere Apollo that he chanced to be at the Louvre. St. Peter's church fares no better with this second Smelfungus: Smollet compares the pantheon to a huge cock-pit, and Kotzebue the church of St. Peter to a handsome woman of the seventeenth century, who has taken all possible care to counteract her charms by a hoop-petticoat and a preposterous head-dress. He is inconsistent, however, in his comparison, for he allows the lady to be handsome, but he denies St. Peter's to be elegant or imposing; more than a dozen popes, and several dozen architects, have been busy at the building, mending, ornamenting, and spoiling it; but 'all their endeavours at producing a grand effect have proved abortive!'

The population at Rome does not exceed one hundred and twenty thousand souls, and as the city numbers very nearly three hundred churches, chapels, &c. there is ample room for the exercise of devotion. It is represented as being a most grievous custom to bury the dead bodies within the churches, and, from the scarcity of wood, it is the horrible practice to inter them without a coffin; they are thrown headlong into the vault on a heap, and the mouth of it is merely closed with a loose stone. The putrid stench which arises from this dreadful custom is, of necessity, offensive and deleterious in the extreme.

The following account of the chambers of the dead is curious:

"I went into the church of the capuchins, to see a painting of Guido representing the archangel Michael holding one of the devils by a chain. My pleasure was greatly interrupted by the capuchins assembled here. A

lay-brother, the valet of cardinal Bernis, had just died, leaving a considerable property. The monks, after having put the body into a *capouche* and carried it hither, stood now round the bier, with a number of ludicrous ceremonies.

"My guide having mentioned the burial-place of the capuchins as something very extraordinary, this raised my curiosity. Yet I never thought of meeting with a scene like that which struck me there. I shall never forget the impression which it made on me. The reader must expect neither church-yard, nor vault, nor cellar, nor cavern. In a lower story of the convent, not quite under ground; there is a range of arched chambers, with several windows looking into the garden of the convent, and all opened. I never breathed a purer air than here; and certainly I was in need of it, for the aspect was of itself sufficiently oppressive. A passage running down close under the windows, is allotted for the living that may wander here; and is separated by a small balustrade from the lower vaults, the quiet regions of death. Every arched room beyond this balustrade appears like a grotto; and each is laid out with human bones, and provided with niches. In every one of these niches we discover a dead capuchin, dressed in his *capouche*, and with a long beard; for the dead bodies buried here do not suffer putrefaction, but only dry up. The best-preserved are placed in these niches. On each of the skinny carcasses there is a ticket, bearing the name, and the hour of death, of its possessor.

"The apartments for this purpose are very small, yet harbour hundreds of such tenants. They lie here till they are dried up; when they are brought to light again, in order to yield their former spaces to their successors. A small plain black cross marks every grave. The ceiling is ornamented with arabesks consisting of human bones. A pretty large cross is composed entirely of the small bones under the throat. Several girandoles with long branches, and lamps of different sizes, all hang down. Sconces of the same composition decorate the passage running along these places.

"These chambers are all set out in different styles. One was decorated with skulls only, another with hip-bones, and so on. We raised the *capouche* of one of the corpses, and discovered underneath it a skin very much like yellow parchment. Each of them carries a light in its hand, and every girandole and sconce is provided in the same manner; which must have a strange and solemn effect at night. No foreigner should neglect to visit these last retreats of humanity, where thousands of his fellow-creatures peacefully dwell near or above each other. The emperor Joseph has been here; and I wish every prince who visits Rome would do the same.

"From the fourth grotto a door opens into a small chapel, where mass for the dead is said. It is laid out like the other rooms, but with a more sparing hand. The reflections

of the stranger are here interrupted by the discovery of some very indifferent sonnets on the frailty of human life, inscribed on the walls.

"On leaving the chambers of the dead, we may cast a look on some fine paintings by Peter of Cortona and Dominichino Lanfranco in the church, to dispel our gloom; and may view the altar containing the remains of Justinus, a saint who is reported to have been at once a christian martyr and a philosopher."

The manners of the modern Romans cannot be supposed to differ materially from those of the Neapolitans. Gaming is equally prevalent, and the age of miracles is *not gone*, although the disgrace of St. Januarius might reasonably have been suspected to have staggered the firmness of credulity. A miracle was performed on the 21st March, in the year 1803, attested by the nun who was the subject of it, the superior of the convent and all the sisters, the confessor and two learned physicians, whose medical skill in the restoration of the patient was of no avail; at length her disorder was cured through the benevolent intercession of the Madonna. The priests of the church of this devout nun's benefactress have not failed to turn the miracle to their advantage. The orthodox believers thronged thither in crowds; for three days a *triduo* was celebrated, and on the third, his holiness Pius VII., attended by twenty-one cardi-

nals, was pleased to visit the church, and to impart his benediction!

When a foreigner, says Kotzebue, returns to Rome, after visiting Naples, he will be more than ever struck with the stillness and solitude of the streets. 'Rome seems as if it had been depopulated by a plague: but it is only the effect of the pestilential dominion of the priests. The city contains one hundred and twenty convents for monks, and fifty-one nunneries.' Rome is less filthy than Naples, nor is beggary carried to so impudent and offensive an excess: the wearing of offensive weapons is also prohibited here, but not so strictly as at Naples. Fatal stabs with knives are still frequently given in quarrels, for the Romans, although they esteem it a vice to steal, do not regard murder as a crime. Pius VI. suppressed many Sanctuaries, but the police of the *Spanish Place* is under the jurisdiction of the Spanish ambassador, and the assassin may here bid defiance to the ministers of justice.

From Rome Kotzebue returns to Berlin, taking in his way Bologna, Modena, Mantua, Verona, Vienna, Prague, and Dresden. His remarks are in the same style of freedom and vanity: he is often amusing and very communicative—but altogether we have had enough of his company and conversation.

ART. X. The present State of Peru; comprising its Geography, Topography, Natural History, Mineralogy, Commerce, the Customs and Manners of its Inhabitants, the State of Literature, Philosophy, and the Arts, the modern Travels of the Missionaries in the heretofore unexplored mountainous Territories, &c. &c. the Whole drawn from original and authentic Documents, chiefly written and compiled in the Peruvian Capital; and embellished by Twenty Engravings of Costumes, &c. 4to. pp. 498.

BY the preface to this book, to which the name of Joseph Skinner is signed, it appears that several volumes of a periodical work, printed at Lima, entitled *El Mercurio Peruano* (the Peruvian Mercury), which were *richly stored with intellectual treasures, strayed from their destination*, and fell into the hands of the editor. In plain English, Mr. Skinner found these volumes on board a Spanish prize. From these, and from various authentic sources, the present state of Peru has been compiled. In particular, D. Pedro d'Oribe y Vargas, a learned naturalist, resident in London at the time when the book was published, is mentioned as having answered the queries relative to certain phenomena of climate in Peru, his native country. On board the same prize, a bird's-eye view was found of the festival in the great square of Lima,

on the accession of his present catholic majesty Carlos to the throne, and from this the prints have been taken, representing the dresses of the different inhabitants. A map of Peru should have been added, and might easily have been given, as the splendid Spanish map of their American possessions has been copied in London.

The volume begins with an unnecessary and uncandid depreciation of the old historians of Peru, because they did not 'soar to the contemplation of man in his moral and physical relations.' Credulous they undoubtedly were, and so much the better; for whatever may be thought of the old question concerning superstition and atheism, it is better that historians and travellers should believe too much, than too little; it is better that they should repeat exaggerations or falsehoods, than suppress

facts because they think them untrue; it is better that they should leave the reader to exercise his own judgment, than take upon themselves to decide for him. As for soaring to the contemplation of man in his moral and physical relations; gentlemen who soar so high, see but little—they who write travels must not travel in air-balloons.

The volume promises us more precise, and, at the same time, more novel information concerning Peru, than any that has hitherto been given. The first section is entitled *general idea of Peru*. The political geography of this country has been changed, during the last century, by the dismemberment of the provinces on the north, which form the kingdom of Quito; and of those toward the east, which constitute the viceroyalty of Buenos-Ayres. The population consists of every possible combination between Spaniards, Indians, and Negroes. The improvement of the human species, by crossing different breeds, was a favourite subject of speculation with major Jardine; while the colour is the same, he may be right—Spanish and South-down do well together. But it does not do to cross races. The mixed breeds between European and African, and European and Asiatic, seem to have a certain mulish obliquity of nature, as if the course of nature had been perverted in the mixture. Whether the European and American succeed better we have had no experience. The experiment has been made upon a large scale in Mexico and Peru, but we do not know the result.

Sowing and planting, and domestic employments, were, till very lately, wholly performed by negroes. It is only, we are told, within these four years past, that white people have condescended to these tasks, which were formerly, and by many of their countrymen still are thought infamous for men of their complexion. Commerce flourishes since it has been unrestrained; that is, unrestrained with the mother country, instead of being limited to the galleons and the fairs of Porto-Bello and Panama. Manufactures consist almost entirely of a few friezes, used chiefly by the Indians and Negroes: hats, cotton cloths, and drinking-glasses, also are manufactured here, though in small quantities. Sugar, Vicuna wool, cotton, and Peruvian bark, are the only home-raised articles of exportation. The mines are still productive, though little industry is employed in working them; as the commerce of the country increases, mining

speculations will be abandoned. The ships of Peru trade with corn to Chili, with timber to Guayaquil, and make a few voyages to Chiloe, Juan Fernandes, Valdivia, and Panama. We navigate, says the writer, with economy and ease, but are deficient in the scientific part, deriving no aid whatever from astronomy. After this confession, we need not say they are bad sailors; but coasting-vessels are multiplying, and navigation will improve. The fisheries on the coast are neglected, and the lakes are not well stored. The agriculture is bad; and it appears that the subsistence of the people is precarious, and dependant upon foreign aid.

“Knowledge is general throughout Peru, as well on account of the natural quickness and penetration of its native inhabitants, as through their fondness for study. In whatever does not require a meditated combination of ideas, the fair sex has commonly the advantage over ours. The royal university of St. Mark of Lima, and, proportionally, the other universities of this kingdom, form a centre of literature, which diffuses an abundant light to the whole of the circumference. Under their auspices, the moral and philosophical sciences have, latterly, made an incredible progress, having found their way into all the schools, and thence diffused themselves rapidly into every order of the state. It is our earnest wish that this philosophical light may, by its permanence and efficacy, influence and ameliorate the common system of education. It is on that score alone, in the acceptance which embraces the whole extent of the kingdom, that Peru is in some measure defective. A good taste, urbanity, and a social disposition, are the hereditary qualities of every Peruvian.”

Vestiges of the monuments of ancient Peru. There are obelisks at Tiahuanacu, a formidable pyramid (not having an English gradus ad Parnassum, we can only guess that this epithet is given as synonymous to large), and colossal statues of stone, together with a variety of human figures well cut in stone, which point out that this monument belonged to some gigantic nation. The facts are important; the inference about as legitimate as it would be to say that our ancestors were twelve feet high when Gog and Magog were placed in Guildhall. In the province of Chabapoyas there are conical stone buildings, which support large busts: they are situated on the declivities of mountains in spots so inaccessible, that both materials and workmen must have been lowered from above. It is conjectured that the Caciques, who erected them as their mo-

ments, placed them in these difficult situations that they might not be destroyed by man. Mummies are found in the catacombes; the word mummy should not have been used, as it implies more than it is here meant to imply. How these bodies were preserved has not been yet ascertained; some persons have conjectured by mere exposure to the action of frost; but, it is replied, that they are found in the vallies, and in the warmer parts of the country. Many ruins are specified in proof of the skill of the Indians in civil and military architecture; and of the roads cut through the middle of the Cordillera mountains: it is said that the encyclopedists, who have denied their existence, have only to send some one to view the splendid vestiges which yet remain. Mines of the natives are mentioned, and, what is more extraordinary, fragments of aqueducts, which prove that they were acquainted with hydraulics. In this science, and in agriculture, it is admitted that the Spaniards have not only not exceeded them, but have fallen short of their progress. As in China, the Peruvians filled up the clefts of their rocky hills with mould, to increase the quantity of cultivated ground. Their sepulchres still occasionally supply specimens of their paintings, manufactures, mechanical instruments, and weapons. Many remains of their poetry and music still exist. The shepherds still use the *quipos* to reckon the number, increase, or diminution of their flock, to record the day and hour when a sheep died, a lamb was weaned, or one of the flock stolen. Pillars erected to point out the equinoxes and solstices; the names given to the planets; the celestial observations relative to eclipses; and those by which they kept their time, are so many data by which their progress in astronomy may be calculated. These data therefore exist, unless this language be wilfully inaccurate, which assuredly we have no reason to suspect. How much do we regret that these very important facts are related, in the book, little more at length than in our recapitulation! and how earnestly do we wish that they had been described minutely, and that views had been added. As for the civilization of Peru and Mexico, there is no doubt that both countries were in a very high and extraordinary state of civilization. A print is subjoined to this section, of the costume of the *ynca* and his queen, as the modern Indians represent it in their processions. This costume is so evidently fictitious, that it should not have been

copied: it is fit for nothing but the pantomime of Pizarro.

Physical geography in Peru. From the insufferable bombast of this chapter we can collect nothing. Some queries relative to the climate follow, with answers by Don Pedro, himself a Peruvian. They terminate in a conjecture, that by erecting conductors *sufficiently high and sufficiently numerous*, the fickle atmosphere of Great Britain may be converted into a climate as serene, steady, and beautiful, as that of low Peru. The iron-masters will have no objection to the experiment.

From the section upon botany, it appears that able botanists have been sent over by the late and by the present king; both monarchs will long be remembered by the Spaniards as the benefactors of science. Of zoology little is said: there is a print of the Llama, and a wish expressed that attempts may be made to domesticate the vicuna, which, as the Indians hunt them for their wool, will also be destroyed. The next section is upon anthropology. It is said here, that in the cabinet of natural history at Lima, a tooth (one of the *molars*) is deposited, taken from a mummy discovered in Tarija, which weighs a pound and a half! The body from whence it was taken, was conveyed from Tarija to Cuzco by the marquis of Valle-Umbroso, and shipped for Madrid; but taken on the way by the English and carried to London. *If, perchance, the Peruvian mercury should reach that capital*, say the writers, we request to know, through the medium of the Philosophical Transactions, whether the giant thus intercepted wants the tooth in question. Was there ever so prodigious a fable so circumstantially related? Another such tooth is mentioned weighing more than five pounds, found in the same province. Either Garagantua, or Og the king of Basan, who used to catch whales in the mid sea, and toast them against the sun, must have been buried in Tarija. An account follows of a living giant, with arms like a Gibbon, bulkier than the Irish giant, but not taller and worse proportioned: a moderate reasonable giant, such as an Englishman might safely speculate upon for a show—a monster with grinders of a pound and a half weight would eat up Mr. Pidcock.

Mineralogy. From the statement in this chapter it results, that in the eight intendancies into which the viceroyalty of Peru is divided, there were, in the year 1791, sixty-nine serviceable mines of gold, seven hundred and eighty-

four of silver, four of quicksilver, four of copper, and twelve of lead; at the same time that twenty-nine gold, and five hundred and eighty-eight silver mines had, by various accidents and casualties, been rendered unserviceable. In this statement the mines contained in the kingdom of Quito, and in the viceroyalty of Buenos-Ayres, although these domains may be considered as constituting a part of the Peruvian territory, are not comprehended.

"During a space of ten years, from the commencement of 1780 to the end of 1789, the above mines yielded thirty-five thousand three hundred and fifty-nine marks of gold, twenty-two carats fine; and three millions seven hundred and thirty-nine thousand seven hundred and sixty-three marks of silver.* In the year 1790, the silver mines yielded four hundred and twelve thousand one hundred and seventeen marks of that metal; being an excess of thirty-eight thousand one hundred and forty-seven marks over the average produce of the ten antecedent years.

"It would appear that the mines of Mexico are much more productive than those of Peru, since in the above year of 1790, which was far from being reckoned one of the best, five thousand and twenty-four marks of gold, and two millions one hundred and seventy-nine thousand four hundred and fifty-five marks of silver, the produce of the mines, were coined in the royal mint of Mexico. The proportion of silver was consequently in the ratio of more than five to one greater than that afforded by the Peruvian mines."

The Mexican mines flourish, while the Peruvian decline. Two writers in this magazine explain the cause of the decline. There is a want of capital: the money-lenders lend small sums in small instalments, for which they are to be paid in *pina*, that is, the silver after it has been freed from the mercury with which it was amalgamated, and before it has been fused. This they have at so low a price, that their interest is eighteen per cent. for three or four months. What they advance is not all in specie; a great part is in coarse baize, and other commodities, exorbitantly rated, with which the miner pays his labourers in kind, and they often run away. Another cause of decline is, that neither whites nor negroes can work in the mines; they soon fall victims; the native Indians *last longer*, but they are scarce. In the royal mines they are compelled to work, and it seems that the private miners would very willingly be permitted to enforce the same prerogative.

Commerce. With these details we shall

not detain the reader; it is of little general interest to enter into minute accounts of a commerce in which we can have no participation. The facts respecting population are of more importance. There are, in the viceroyalty of Peru, one thousand three hundred and sixty towns, and yet, according to the highest computation, the number of inhabitants does not exceed one million! four hundred thousand of these are Indians. There has been a grievous depopulation. In 1551 the royal commissioners stated in their returns, that the number of Indians amounted to eight millions two hundred and fifty-five thousand; it is true that the viceroyalties of Santa Fé and Buenos-Ayres were comprehended in the census, still the depopulation is prodigious. The small-pox, unknown in Peru till the year 1588, has been the main cause—to the American tribes this disease has proved dreadfully fatal; but though this be the main cause, a heavy load of guilt remains for Spain: white men will not work the mines, and they will not compel the negroes to work them, because it kills them too soon, and negroes cost money; but the Indians are grown upon the spot, and it is what they are born to—a curse which they have inherited from their parents. Doubtless the Spanish casuists can trace their genealogy to Canaan, the son of Ham, and silence all scruples of humanity by quoting Noah's malediction; doubtless the Spanish politicians can prove that the produce of the mines is indispensable to the state, and that human lives, when weighed against gold and silver, are as dust in the balance. We indeed exclaim against this systematic inhumanity; but with what consistency do we exclaim against it? or why do we deny that to be good logic for America, which is admitted as irrefragable for Africa? While England continues the slave-trade, she must not inveigh against Spain; while we consume negroes, we must not cry out against the consumption of Indians.

From 1517 to 1790, nearly eleven millions of negroes have been transported into Peru! and these also have been consumed! The Spanish writer plainly states, that they are so many individuals lost to the growth of the population, and the reasons assigned are hard usage, cruelty, the rigorous labour exacted from the females during pregnancy and immediately

* The mark of gold being estimated at a hundred and twenty-five piastres, and that of silver at eight piastres, the total amount, in sterling money, of the produce of the mines, during the above ten years, will be found to have been of the value of 7,703,545*l*.

after parturition, and the melancholy which their miserable situation occasions. When will this traffic have an end; this foul disgrace to Europe, to Christendom, but to England in particular! The work of retribution is begun in Hayti: there the iniquity began, and there the first account has been rendered—who can tell where it will stop!

The mixed descendants of the negroes in Peru become perfectly white in the fourth generation; this is said to be so prejudicial to the kingdom, as to have repeatedly called for the interference of the legislature. What colonists arrive from Spain seem to be so many lost to the mother country, which ill can spare them, and nothing added to Peru: some few make fortunes and return; others remain single, because they and their posterity would be alike excluded from any honourable situations:—this should have been more clearly explained; nor do we understand, by the phrase which is used of *embracing celibacy*, whether it is meant that these persons merely remain single, or enter into the monastic orders. This is one specimen of the miserable style of the book. A great proportion of the European emigrants are mere vagabond adventurers; of no use while they are above ground. Hands, therefore, are wanting in Peru, and of course every thing is wanting in proportion; roads, bridges, canals; there is no internal commerce in consequence. The conclusion of this essay, which thus exposes the weakness of the country, was suppressed by authority.

Historical and Political Reflections on the Population of Lima. The capital of Peru contains three hundred and fifty-five streets, three thousand nine hundred and forty-one houses, including one hundred and fifty-seven which belong to religious communities, and fifty-two thousand six hundred and twenty-seven inhabitants. Of these one thousand six hundred and forty-seven belong to the different monastic orders, and three thousand one hundred and eighty-four live in religious communities without having made the vows; but these also are to be considered as lost to the state—a proportion, on the whole, of one to eleven! the secular clergy are not included in this number. There are nine thousand two hundred and twenty-nine slaves, two thousand nine hundred and three free servants. The capital has increased one-fifth in size since the vice-

royalty of Buenos-Ayres separated from Peru.

The account of the university of St. Mark, in this capital, is characteristic.

“The fees disbursed on the admission to the different degrees, were originally very high. Each doctor of the faculty, besides paying a considerable sum to the rector, head master, register, and other officers, was obliged to fee all those who composed the chapter, or assembly, at the time of his admission. If he took a secular degree, he gave to each of them a velvet bonnet; and if the degree was ecclesiastical, a bonnet of cloth. To this gift he added another, of six fat hens, four pounds of cold viands, and a pair of gloves. These disbursements, united with the expences attendant on the public exhibition of a bull fight, in the great square, on the day of admission, and the sumptuous entertainment given to all who were present, were found, on an average estimate made in 1743, to amount to the extravagant sum of ten thousand piastres for each degree. To remedy this inconvenience, it was then settled that the graduate should pay into the chest of the institution the sum of two thousand piastres, to be divided equally among the doctors; and should provide a slight refreshment for those who were present at his examination. He was, besides, to bestow small fees on the rector, head master, register, and other persons holding literary employments in the college. The gross amount of the charges has been since reduced to one thousand and sixty-six piastres.

“To obtain the degree of doctor, that of bachelor is, in the first instance, indispensably requisite. For this purpose, the student must be provided with a certificate of his having attended five courses in the faculty to which he aspires, together with another certificate of his having taken the private lessons, without which his studies would have been incomplete. The expences of this degree are moderate, amounting to twenty-five piastres only. Conformably to the spirit and tenor of the laws of the kingdom, whenever ten degrees of bachelor have been conferred, a similar degree is to be bestowed on a poor scholar, as a stimulus to application, and a recompense for the successful prosecution of his studies; but this favour has been liberally dispensed by the academy, which, with a view to the prosperity and cultivation of the sciences, has not limited itself to the number of indigent students for whom the above legislative provision was made.

“The ceremony of the reception of a doctor in this university is not uninteresting. On the day appointed, at sun-set, the interior of the hall having been lighted, and the doors closely barred, the examination commences before the masters and doctors, who alone are allowed to be present. Between the first and second lessons, an oath is administered by the

rector to each of the assistants; and when the second lesson is concluded, four of the doctors, the junior taking the lead, maintain a controversy with the candidate. This does not, however, prevent any one present from making such observations as he may deem essential to his further satisfaction and security. The rector, the president, the four replicants, and the six most ancient doctors of the faculty, now proceed to vote privately; and by their suffrages, the individual who has been examined is either admitted or rejected. The whole concludes by a refreshment of sweetmeats and jellies, substituted to the supper ordered by the ancient institutions of the academy.

"On the following morning, the degree is conferred with every solemnity. Provided the ceremony be not, by special favour, performed in the interior of the university, the chapel of the blessed Virgin, belonging to the great church, is splendidly ornamented; and thither the graduate, accompanied by the students, collegiates, and doctors, proceeds to make his profession of faith. The rector having administered to him an oath to defend the mystery of the immaculate conception, and to detest the execrable doctrines of tyrannicide and regicide, the degree is delivered to him by the head master, at the same time that the register invests him with the badges of his newly acquired dignity. This being done, a latin oration is pronounced in his praise, and a theme proposed to him for the exercise of his talents.

"The number of doctors is not limited. At this time (in 1791) there are one hundred and thirty-four in the faculty of theology; in that of laws, one hundred and sixty-four; in that of medicine, twelve; and six masters of arts."

The university is poor, nor would its rents be sufficient, if several of the chairs were not vacant, and if the other professors did not give up half their salaries. The members are celebrated for their patriotism.

"It is impossible to read without satisfaction the sacrifice of life, goods, and persons, made by the doctors, masters, and students, in 1709, when the English, having invaded the port of Guayaquil, excited a general panic throughout the kingdom. They enrolled themselves, without any exception of classes or conditions, for the king's service, and formed themselves into companies. Dr. Martin de los Reyes took the command of the company of the ecclesiastics who composed the chapter; that of the seculars was commanded by Dr. Bartolome Romero; and that of the students by Dr. Thomas Salazar. The rector, Don Isidoro Olmedo, to evince his attachment

and fidelity to his sovereign, took the command in chief."

It may be impossible to read this without satisfaction in Lima, and it is impossible to read it in England without smiling. If we were reduced to the necessity of arming our own universities, the heads of colleges would not be the fittest possible commanders. They themselves would not think it necessary, to evince their loyalty, that they should change their wigs for helmets.

The charitable establishments in Lima are many and flourishing. They have a theatre, which is fashionable: the writer wishes that the comedies, of which monks, popes, and saints, are the heroes, were laid aside; that the actors would declaim with less violence; that any one might be permitted to seat himself in the pit without regarding his dress or his periwig; and that the company would not smoke. Silence, and no smoking, is the motto in the theatre at Corunna. Coffee-houses were first established in 1771; they succeed well.

"The literary memoirs of Madrid * contain the provisions made by Don Mariano Colon, superintendant-general of police of that court, with a view to the introduction of a greater decorum in the coffee-houses. The principal enactments are as follow: 'first, that in all the coffee-houses in which a certain share of decency, and a corresponding neatness, should not be observed, painted cloths should be hung up, the walls white-washed, and the doors and tables coloured. Secondly, that a clean dish should be served to each individual, notwithstanding three or four persons should unite together, for this reason, that, in pouring the liquor from the cup to the saucer, it was spilled on the table, so as, by the slightest inattention, to stain the clothes and mantles of the company. Thirdly, that the waiters should, on their presenting themselves, be clean, without either a net or a bonnet on the head, and, if possible, combed, &c. &c.' What would some of our readers say if we were to insinuate the like?"

The detestable amusement of cock-fighting is permitted twice a week on working days, and on Sundays and festivals. There is a regular cock-pit; seats are paid for, and the mob admitted gratis to stand. Not a hint is ventured in reprobation of this cruelty. Bull-feasts, of course, are fashionable. Tennis is represented as a ruinous game, in consequence

of the enormous bets which are made upon it.

Customs and manners. This is the satirical portion of the work, and not the least valuable. In the form of a fragment upon the state of the Roman colonies in Africa, one writer insinuates that the Indian and Negro female slaves are the mistresses of the Spanish husbands, the bawds of their wives, and the nurses of their children: that they sway the fashions, direct the education, and contaminate the morals of the youth; and that their influence is so great, that the European women even imitate them as far as possible. Another satirist exhibits a Peruvian beauty in a dream, there, to expose the manners of his countrywomen.

"Observe attentively: that white which surprises thee so much, is a thin coat of arsenic or white lead, laid on with art, and in a manner glued to the skin. This is a despicable custom in any other nation; but, among the countrywomen of EUGENIA, it is absolutely criminal, seeing that, by its adoption, they injure and tarnish their natural whiteness, that surprizing whiteness which excites the envy of all the other ladies in the world. Art thou desirous to see the mischiefs by which this detestable paint is accompanied? Remark the forehead, which has a somewhat disproportionate width: it proves that the hair has fallen off at the temples, by the friction of this vile ingredient. Observe, now that she smiles: she has several decayed teeth; and if it were lawful for thee to approach her, thou wouldest be sensible that her breath even is in some measure vitiated. All these are consequences of the same abuse."

"The hands," exclaimed in continuation the scrupulous censor, "those hands which, physically, are beyond a doubt well shaped, delicate, and handsome, have, in a moral point of view, several very notable defects. Those honourable marks which the use of the needle, or of the distaff, occasionally leaves, are not to be traced on them. Among her countrywomen, it is considered as derogatory, to know how to take up a loop in a stocking; and but few are to be found who are able to embroider a pair of ruffles, for the husband, or for the boys. The discoloration which is so perceptible at the tips of the thumb, forefinger, and middle finger of the right hand, is owing to these extremities being regularly made to answer the purpose of the fork, in the repasts:—a filthy practice by which the strongest stomach must be nauseated. Fortunately, however, this indelicacy is not to be found among certain principal nymphs who are the flower and the glory of that highly favoured country."

It is curious, that what Ben Jonson calls

'the laudable use of forks
Brought into custom here, as they are in Italy
To the sparing o' napkins,'

should not yet have become general in the Spanish and Portuguese colonies. Perhaps they agree with the German divine who preached against the custom, and said it was an insult against Providence not to touch one's meat with one's fingers.

"The most conspicuous part of the costume is the *faldellin*, or short hoop petticoat, more particularly worn in the carriage, and at public entertainments. It is made of richly embroidered cloth, velvet, &c.; is rendered flexible by the means of whalebone; and provided with a wadding, to give it a greater protuberance, so as to display the ankle more perfectly. It is attended, however, by this inconvenience, that, in climbing a hill, or on any sudden motion, the wearer makes an exposure which borders on indecency. Its numerous plaits cause it to assume a variety of graceful forms, at the same time that they render it very costly, fifteen yards of stuff at the least being consumed in the outward covering. The expence of this article of dress alone, is rated at between three and four hundred crowns; notwithstanding which, a modish female of Lima seldom pays a ceremonious visit, without having previously had recourse to the *Bodegones*, the principal street in which the fashionmongers reside, for a *faldellin* of the newest taste. In their jewels, and, in general, in every part of their dress, the ladies of the Peruvian capital are equally extravagant.

"One of their favourite ornaments is the *puchero de flores*, or nosegay, which, as it may serve to illustrate the progress of luxury in that capital, with the civil history of which it is in some degree connected, merits a detailed description. Its basis consists of the blossom of a small apple of the size of a nut, of a white lily, of one or two rose-buds, of the same number of cherry-blossoms, and of the flowers of the Seville orange; the whole laid on a plane-leaf, of the dimension of the eighth part of a sheet of paper. On the surface of this plane-leaf are disposed chamomile-flowers, the flowers of the yellow lily, violets, daisies, and thyme, and, over these again, a small branch of basil mint, another of a sweet pea bearing a violet flower intermixed with white, and, occasionally, a stem of hyacinth, a branch of the odoriferous rush having yellow flowers and white leaves, and the blossoms of a small fruit, a kind of strawberry, but larger in size. Having been sprinkled with a water of a common scent, or with a spiritous solution of amber, this *puchero* is valued at half a real.

"The different aggregates, such as the blossoms of the little orange of Quito, of the apricot, of the small apples which have an amber colour, of the larger fruits, and of the medlar, together with the *chirimoya*,* carnations,

* A flower of mean appearance, but of exquisite scent.—*L'Alou.*

gillyflowers, anemones, tulips, and other flowers in full season, being conjoined with a *puchero* of double or treble the size of the simple one, augment its price to two or three piastres. Its value is raised or diminished, in proportion to the private festivities which are on foot, and to the times of the public festivals.

"To the augmentation of value above-mentioned, is to be superadded the price of the flower named *ariruma*, which is so arbitrary, that it rises from six reals to six or seven piastres, according to the season, or to the demands of the purchasers. Artificial flowers of this description having been recently introduced, have in some measure diminished the value of the natural ones. It is, however, to be noticed, that the *puchero* of natural flowers is to be procured at every season of the year, there being simply a variation of the more exquisite flowers, which, for want of a proper degree of skill in the culture, are not at all times obtainable.

"This indispensable luxury is purchased by all the different classes of females, in a street fronting the steps of the cathedral church, from which it is distant about fifty paces. Thence the expectants proceed, either to seek diversion from the chances which may present themselves, or to wait the appointments that have been already made. It is needless to add, that the *Calle del Peligro* (Hazard-street), for so this street is denominated, on account of the dangers to which libertines were formerly exposed, in their intercourse with the abandoned females by whom it was frequented, still continues to be the rendezvous of gallantry.

"The station occupied by the women who deal in flowers, is divided between those whose speculations are on a large scale, and the retailers. The former have their backs to the church; each of them confining herself to one or two species of flowers. They are the female gardeners; and in their front are ranged those who make the *pucheros*, on the tables placed before them. They are very intent on this occupation, and at the same time very courteous.

"In private houses, the *puchero*, or that which corresponds to the *puchero*, is constantly made to serve as a domestic and favourite gratification. The ladies select the flowers, and free them from the sandy and seminal particles, which are apt to soil, and are devoid of scent; such as the yellow at the extremity of the orange-flower, the fibrils of which give out an amber stain, in common with those of the daisy and rose-bud, and of the blossoms of the medlar, apple, and smaller fruits. Having sprinkled them afresh with the purest water, they are placed beneath a crystal vase, into which is introduced a small chafing-dish filled with live coals. On this chafing-dish is poured the most exquisite perfume, blended with different aromatics, to the end that the natural fragrantcy of the flowers may be heightened.

"This delicate operation having been performed, an economical distribution is made among the ladies who are present. Each places her portion in her bosom, and thence presents her favourite with an orange-blossom, or a small bunch of flowers, which sometimes receive a greater value from the beautiful hand that bestows them, than from that of Nature herself."

The portrait of the men is even more unfavourable than that of the women. Satirists use dark colours, but even in caricature they endeavour to preserve some likeness. Unless those writers foully belie their countrymen, a detestable vice is practised at Lima, which, to the honour of the Spanish peninsula, is no more tolerated there than in England.

Essay on the false religion and superstitious customs of the Peruvian Indians. The chief deities were *Apuini*, the sun, the lord and father; *Churi Inti*, son of the sun; *Imic Vauqui*, brother of the sun; and *Tarigatanga*, one in three and three in one, if this interpretation is to be believed. Besides these there was the idol *Rimac*, or the speaker,—who may have been their oracle; and *Pachacamac* the omnipotent, whom they regarded as above all, the deity whom perhaps the priests acknowledged, who invented idols for the people. For private and particular devotion they had household gods called *Conopas* or *Guiscamayec*, lords of the house; *Compas*, stones to whom they prayed for water; *Huanacas*, other stones erected in their plantations that they might lighten the toil of the husbandman; and *Mamateras*, long cylindrical stones who were to take care of the maize, and supply abundant crops. To bestow upon these poor idolaters, immersed as they were in darkness and error, the intelligence they needed, the essayist tells us, immense wisdom prepared the fittest means. It discovered to Europe this valuable part of the globe, and transferred its dominion by the right of conquest to Spain!—Happy change for the Peruvians! it is true that those who were not put to the sword were made slaves, and that a few millions have been worked to death in the mines; but what is that to the incalculable advantages communicated to their posterity? Have they not got nuns instead of *Acllacunas*, and the true trinity instead of *Tarigatanga*; crucifixes and madonnas instead of *Guasimucoyca* at home; and crosses in the fields instead of *Compas*, *Huanacas*, and *Mamateras*, besides a whole army of saints to pray to into the bargain.

Account of the costumes, superstitions,

and exercises, of the Indians of the Pampa del sacramento and Andes mountains of Peru. The country in which liars and dreamers placed El Dorado with its capital Mansa, is inhabited by various savage tribes in a miserable stage of ignorance. Their complexion would be almost of European whiteness, if exposure and unguents had not made them swarthy: they are well made and strong, because they murder the deformed infant, and their habits of life destroy the feeble one. To make the body strong they bind the waist and the joints of their male infants with hempen bands, and they flatten the head before and behind to make them like the full moon. Unmarried women go naked among them, and among those tribes who inhabit the warmer parts, all are naked. They have no idols, but worship the maker of the world during the time of an earthquake, and only then. They call him father, and believe that having made the world he retired into heaven. An evil being is also acknowledged by them, whom they place in the centre of the earth. Their conjurers represent themselves as his delegates, *Mehanes* or *Agerres*. Mr. Skinner calls them, overlooking that the latter word is only a Spaniard's translation of the former. Polygamy is only in use among the Caciques, yet they delight in aporodisiacs, and some circumstances are mentioned which indicate a loathsome sensuality, as degrading as that of the Polynesians.

Their notions of a future state differ in different tribes. Some expect a world like their own, with plenty of boiled plantains and yucas, where they shall fight with thunder and lightning, and sport in the milky way, which is the grove of diversions. Others believe in transmigration, and worship the particular beast into which they conceit their father or their cacique has passed. They cultivate cotton for the only garments they use; and yuca of which they make their only drink, for the water is unwholesome. Stone hatchets and wooden tools are their only implements of husbandry. They use poisoned weapons against wild beasts, but never in war; an extraordinary fact, that having such means of destruction, a sense of honour, or humanity, or policy, should prevent them from exercising them. War is the main business of their lives. They bring home the heads of their enemies, make necklaces of the teeth, and masks of the skin, and hang up the skulls as ornaments from the roofs of their dwellings. Among the Itucalis, a warrior,

whenever he carries home the head of an enemy, opens the skin of his own nose, and puts in the little husk of the palm under it, just upon the bridge. A nose completely embossed from the top to the tip in this manner, is as honourable as a blue ribband in England. What is most remarkable is, that they treat their prisoners with great humanity, in all respects like brethren.

Account of the public congregations of the negroes residing in the district of Lima. The negroes are divided into ten casts, according to their original countries; each cast has its own chief, and two head corporals are chosen as chiefs of the whole: each has its meetings, in which the contributions for their festivals are fixed, accounts rendered, and disputes between husband and wife, &c. settled. All the festivals of these poor people are connected with religion, but it is surprizing to find that certain ceremonies, which are clearly derived from their native superstitions, should still be permitted to them.

Historical and chorographical description of the province of Chichas y Tarija. Francisco Tarija, who left his name to this province, might serve as the hero of a romance. Leaving Pizarro and Almagro to devastate Peru, and to turn their arms against each other, he with a small band of followers penetrated to this fertile valley, when the natives who had never been subject to the Yucas, and had never heard of the Spaniards, received him with respect and awe. Here he settled, and peaceably began to teach the Indians the language of Spain, and the habits of civilized life. But his numbers were insufficient, and after his death they relapsed into their former state, preserving no other relic of his language than his name, which they gave to the valley, as it is believed, in affection to his memory. The large teeth are again mentioned in this paper, but the writer has too much common sense to dream that they can have been human. A great blunder of the translator occurs here; he says that the chronicles of Flavius Dexter, &c. "were extracts surreptitiously made from father Geronimo, a romance of la Higuera." The fact is, they were fabricated by the jesuit *Hieronymo Roman de la Higuera*, and Mr. Skinner has converted his name into a romance!

Plan for gaining access to, and peopling the Andes mountains of the province of Guamalies, proposed and set on foot by Don Juan de Bezarcs. The projector of this new settlement is a merchant of Lima,

who were on the point of returning to his native country with a respectable fortune, met with a Spaniard who had long led a savage life among these Indians, and represented to him their docility, and the advantages of the country. Bezares devoted his property to civilizing these people, and reclaiming them to christianity, from which, since the unhappy extinction of the jesuits, they had fallen. Unhappy we call that extinction, because of all the monastic orders they only were well employed. Upwards of twenty towns which they had established were found in ruins,—the term of course has not its European signification, but it implies fixed dwellings, and habits of domestication and agriculture, the first rudiments of civilization. The tree which yields the red bark grows here in great abundance, and also the yellow bark, neither of which had been calculated upon. Other promising productions have been discovered.

“Bezares met with a description of very lofty trees, the wood of which is unknown, but valuable, not only because, with all its solidity, it yields with equal suppleness to the plane and the chisel; but likewise on account of its semi-violet colour, by which it appears to be, in preference to any other wood, adapted to the purpose of dyeing. He found another tree which produces, in the shoots of its branches, a resinous substance in grains, of a greenish hue, which, as he proved it to be an effectual substitute for sealing-wax, is apparently calculated for many uses. A kind of osier or willow, which grows in this territory, is deemed by the Indians a specific in complaints of the bowels, and is named by them *calinture*, because, in employing its decoction in cases of the most violent rheumatic affections, the patient is subjected for three or four hours to a violent fever, which, ter-

minating in a copious perspiration, leaves him free from every ailment. The few trials of this remedy which have been made, have been extremely successful against siphylis; and if the practical enquiries that have been recently instituted should correspond with them, cures may be effected by the means of one of the most surprising simples for which medicine is indebted to the American continent. The production of a worm, which the Indians name *sustillo*, and by which a paper, very similar to that made in China, is fabricated, has been hitherto unknown to all the naturalists.*

Bezares obtained the sanction of the government to form settlements here, and it is supposed that his plans will be pursued;—but however well disposed the government may be to such projects, population is wanting; nor is there that enterprize in the people which in North America almost supplies the want of population, and secures whole provinces of forests and savannahs to be cultivated by their childrens' children.

Repopulation of the valley of Vitoc. This paper communicates some curious historical information. In 1742 Juan Santos Atahualpa fled into the mountains to escape punishment for murder. He called upon the Indians, boasting his descent from the Yncas,—and by his name it appears that some such descent had been allowed by the Spaniards, took the title of Apu-Inga Kuaynacpac, and proclaimed himself the restorer of the empire of his ancestors. A multitude of Indians joined him, five and twenty towns,—or more accurately speaking, establishments of the Franciscans were demolished, and Quimiri, an important post, conquered, and its governor burned in its ruins. The valley of Vitoc, which was then overrun,

* This caterpillar is bred in the *pacae*, a tree well known in Peru, and named by the Peruvian Flora, MS. *mimosa inga*. In proportion to the vigour and majestic growth of this tree, is the number of the insects it nourishes, and which are of the kind and size of the *bombyx*, or silk-worm. When they are completely satiated, they unite at the body of the tree, seeking the part which is best adapted to the extension they have to take. They there form, with the greatest symmetry and regularity, a web which is larger or smaller, according to the number of the operants; and more or less plant, according to the quality of the leaf by which they have been nourished, the whole of them remaining beneath. This envelope, on which they bestow such a texture, consistency, and lustre, that it cannot be decomposed by any practicable expedient, having been finished, they all of them unite, and ranging themselves in vertical and even files, form in the centre a perfect square. Being thus disposed, each of them makes its *cocoon*, or pod, of a coarse and short silk, in which it is transformed, from the grub into the *chrysalis*, and from the *chrysalis* into the *papilio*, or moth. In proportion as they afterward quit their confinement, to take wing, they detach, wherever it is most convenient to them, their envelope, or web, a portion of which remains suspended to the trunk of the tree, where it waves to and fro like a streamer, and which becomes more or less white, according to the air and humidity the season and situation admit. A complete nest has already been transmitted to his catholic majesty; and, by the hands of his naturalist, Don Antonio Pineda, a piece of this natural silk paper, measuring a yard and a half, of an elliptical shape, which is peculiar to all of them,

was only beginning to be repeopled when the Peruvian Mercury was published: the new Ynca then possessed his acquisitions in peace, but left no successor. An Indian Toussaint might shake the Spanish empire in Peru.

Periodical works. Mexico supports a gazette, a civil diary, and another of natural history. The Peruvians now rival this flourishing state of literature; a *Diario Económico* was started at Lima, and soon followed by this *Mercurio Peruano*, which commenced in 1791. The *Semario Crítico* followed this, and it was then boasted that Lima had at length placed itself on a footing with Mexico, at the time of the greatest splendour of the latter city, by possessing a Diary, a Mercury, and a Weekly Critic. In the same year a periodical paper was set on foot at Santa Fe de Bogotá, and another at Quito,—symptoms of improvement these, but which also prove that literature had declined in the Spanish colonies as well as in the mother country, and that its revival was later. Nor are these symptoms encouraged: the editor informs us that the Mercury, after having been progressively subjected to a variety of restraints, was finally discontinued in 1796.

Political economy. The academical society who published the Mercury, offer a gold medal of eleven ounces, with a ring and chain of gold for the best plan for improving the roads, which are in a miserable state, and a silver medal for the second best. One only was sent in, which was not thought worthy of either. The bishop of Quito has exerted himself to promote the same desirable object, and subscribed five hundred piastres towards opening a road in his diocese. He also offered a premium to the best baker,—a fact which proves his own excellent wishes and intentions, and exposes at the same time the sad condition of the colony.

Biography. This article contains biographical sketches of P. Juan Perez Melnacho, a theologian of the sixteenth century, remarkable for his stature and his strong memory; of D. Antonio Leon Pinedo; a useful, laborious, and learned writer of the seventeenth century; F. Francisco del Castillo, a blind improvisatore, not long dead; and D. Diego Lopez, who lost his wits in attempting to square the circle.

Longevity. A single instance is given in a native Spaniard, who lived to be 133. An article upon meteorology concludes the work.

An appendix of considerable length is added, containing a history of the missions of Caxamarquilla, of the origin and loss of those of Manoa, and the travels of P. Manuel Sobreviela, by the river Hualaga to the lake of Gran Cocama in 1790, and of F. Narciso Girbal y Barcelo by the Marañon and Ucayali to the tribes of Manoa in 1791, with an account by Sobreviela of the entrances into the mountainous country made at different times by the Franciscans, whom Mr. Skinner, according to the common error of English writers, calls monks instead of friars. Sobreviela's map was not in the volumes which fell into the translator's hands. We do not recollect whether the great map of Spanish America be of a later date than 1790, or if, as we rather think it be, his survey would be included; but in any case that map should be reduced for the subsequent editions of this work.

A few curious circumstances respecting the Indians and the country may be gleaned from this portion of the volume. Their mode of catching wild beasts might usefully be practised wherever man is placed among such bad neighbours.

“They make a narrow passage formed by stakes of a competent thickness, and six feet in length, well fastened together and fixed in the earth. The top, and one of the entrances, are secured by other stakes of the same description: in the middle of the passage there is a division. At the entrance which is left open, a stout plank, supported by a cord which is slightly secured in the front of the passage, is suspended. When the howlings of a tiger are heard, a dog is shut up in the inner division, who, finding himself in confinement, begins to howl. The tyger instantly darts forward, thinking himself secure of his prey, and being unable to find any other passage than the one where the plank is suspended, enters that way. Now entangling himself in the cord, he springs, throws down the plank, and finds himself hemmed in without being able to hurt the dog, who is protected by the division of boards. After having amused themselves until the animal becomes furious, the Indians put him to death with their clubs and arrows.”

Wolves are trapped in a like manner in some parts of Europe; there is a print of such a snare in one of the early volumes of the Gentleman's Magazine. Some odd things are related of these American tygers, that they watch for the cayman on the banks of the Ucayali, and fasten their claws in his eyes, the only part which they can pierce; and that when they catch a turtle, they imitate man, by turning it on its back, and thus securing it. Polecats

we know catch eels, but when tygers turn turtle-eaters it is time for the court of aldermen to take alarm.

The remains of one of the Yncas bridges are still to be seen over the mouth of the lake Lauricocha, where the Tunguragua, one of the sources of the Marañon, issues from it. They are stone pyramids, excellently wrought, a yard and half square, and placed a yard asunder; does Mr. Skinner mean pillars when he says pyramids?—his grandiloquent style often obscures and sometimes destroys his meaning. We read in this volume of the *exploration of America, of gratuitous erogations, of decortivating the trees, of retrograding on foot, and of a fluviatric voyage*. This gentleman would have written better English if he had not had the misfortune of learning Latin.

The navigation of the Marañon is remarkably inconvenient. Even English sailors would object to going under water on their floats in the whirlpools or pongos.

“These pongos are straits formed by high and pendant cliffs, over which the descending torrents force a passage with such a degree of violence, as to occasion terrible billows, eddies, and whirlpools, by which the balsas are submerged. The latter are composed of fifteen logs or beams of wood, twelve yards in length, and some what less in their united breadth, the narrowness of the pongos not admitting a greater extension. They are furnished with a lofty and solid tilt, formed of canes, beneath which the cargoes are made secure with strong cords. At the extremities, as well as at the parts where the beams are united, other beams, half a yard in height, are firmly attached in the manner of small pillars; and by these the navigators secure themselves, at the time when

the balsa, which, however, speedily returns to float on the water, is submerged in the pongos.”

The information comprized in this volume is new and highly interesting; a more modest title, however, would have been more decorous. Information concerning Peru,—or Transactions of the Society at Lima. A curious book concerning this country might certainly be compiled at Lima, from a few volumes of the Monthly Magazine, but it would not be accurate to call it the Present State of England. We very much disapprove the manner in which it is dedicated to lord Melville: as if no information were welcome to government but such as could be subservient to mischievous purposes. It is the dread of such buccaneering schemes as are evidently in the writer's mind, which has rendered Spain so jealous of suffering any accounts of her colonies to be made public, and such schemes are merely buccaneering. What madman dreams of subduing Peru? and expeditions which end only in plunder are disgraceful to the nation that undertakes them. The Spaniards have been forced into the war against their wishes and against their interest,—it is both for the honour and interest of England to show that she is sensible of this, by sparing Spain as far as may be possible. Willingly would Spain throw off the yoke of France and become our friend, for of all nations in Europe it is the best disposed toward us; every thing which weakens that noble nation, delays the day of its deliverance, and aids the policy of Bonaparte.

ART. XI. *A Tour in Zealand in the Year 1802, with an Historical Sketch of the Battle of Copenhagen.* By a Native of Denmark. The second Edition. 12mo. pp. 182.

THE Danes are a brave, generous, and grateful people; and slight as is the sketch here presented by a native of the manners of his countrymen, every now and then an anecdote occurs which gives a momentary interest to the narrative. Denmark has been singularly fortunate in her ministers of state: the yoke of dependence on the court of Russia, which it was the patriotic wish of the unfortunate count de Struensee to throw off, was removed by the more skilful genius of the younger Bernstorff, who also completed the project of emancipation, undertaken by his illustrious uncle, the old count de Bernstorff.

It is singular enough that the enfranchisement of the peasants was a scheme which

Catharine, probably to weaken the power of the nobility, endeavoured to bring about in the Russian empire. To a similar manœuvre recourse has been had in most countries in Europe, and wherever it succeeded the monarch has found a power succeed more jealous of despotic authority than that which it destroyed. In England, some of our most despotic monarchs incorporated several small towns, and conferred on them the privileges of royal boroughs, that they might send burghesses to parliament, and thus counterbalance the preponderating power of the nobility: Henry the eighth gave to twelve counties, and to the same number of boroughs in Wales, the right of sending each a representative to parliament. Edward

the sixth created thirteen boroughs, and restored ten to the privileges which, from long disuse, they had forfeited; Mary created ten, Elizabeth twenty-four. The same policy was observed in France: Louis le Gros, in the early part of the twelfth century, was the first who endeavoured to counterbalance the formidable power of his vassals, by conferring important privileges on the towns within his own dominion. Still farther to depress the aristocracy, Philip the Fair, in a subsequent period of time, introduced the deputies of free towns into the states general of the nation. The emperors of Germany, in order to undermine the baronial power, which they were not strong enough to oppose openly, elevated the clergy. The consequence was fatal: papal authority rose resistless, and trampled on the imperial insignia.

The Russian nobility had too many examples before their eyes to be seduced into a measure which they feared would diminish their opulence and authority. Whether the present emperor Alexander may be able or willing to effect what the great Catharine failed in, time only can unfold. The elder Bernstorff, however, not dismayed by the failure of a project which, whatever might have been its immediate object, would eventually improve the character and condition of a large mass of people, succeeded in liberating from bondage the peasantry of Denmark. Ignorant people are often unacquainted with their own interests: the author of this *Tour*, whose signature, A. ANDERSEN, is annexed to the dedication, says, that at first the abolition of vassalage, by which every peasant became his own master, and enjoyed the fruits of his own labour, was considered rather as an hardship than as a blessing. Lands were parcelled out in lots, upon which farm houses were erected, and those peasants only remained in the villages where lands were contiguous. The others, however, were placed in a situation in which they knew not how to begin business: removed from a farm the good and bad qualities of which they were acquainted with, some of them were perhaps invested with a sterile part, or allotment of a common. An agricultural society, however, was formed, which rewarded individual exertions in husbandry, and activity and diligence were crowned with merited success. The change has been as beneficial as the warmest philanthropist could have wished, or the most eager zealot have anticipated.

The peasantry, roused from their torpor, have testified the sense they since acquired of their ameliorated condition, and the grateful feelings with which they are impressed towards their benefactors, by erecting stones in memorial of their deliverance, and in honour of their deliverers.

Mr. Andersen has called his book the narrative of a *Tour in Zealand*: by applying the compasses to his scale of Danish miles, at the bottom of a neat little map of the island, it does not appear that his peregrination at any time exceeded half a dozen miles from Copenhagen, or that the whole extent of his *tour* could be five and twenty! From the capital he went to Roeskilde, then proceeded north as far as Elsinour, and coasted along the Sound back again to Copenhagen.

We have said that the Danes are a *gallant* people; henceforth let it be recorded, to the honour of the north, that they are also a most *gallant* one. Several young women, whose *lovers* were killed in the memorable battle of the 2d of April, 1801, received relief from the patriotic fund which was established on that occasion.

The historical sketch of the battle of Copenhagen, which is annexed to this *tour*, is full, and, no doubt, accurate. The engagement did infinite honour to the bravery of both parties: the Danes were certainly unprepared for it, and at this time would present a far more formidable resistance. As it was, Lord Nelson did not hoist the white flag until two British ships of the line, by running foul of each other, got aground, and were raked by red hot balls from the battery of the three crowns.

The day of peril and of suffering was to the Danes the commencement of a new era in their military establishment; and the great accession of strength which their navy has received since that event, testifies the confidence they repose in its exertions on any future emergency.

Within the space of one year after the battle of Copenhagen, a fund of upwards of fifty thousand pounds was raised, the interest of which is applied to the maintenance, relief, and education of about six hundred and fifty persons, who had suffered either individually or by their connections in that engagement. When any of these pensioners die, the portion employed in his maintenance reverts to the capital, which is established in perpetuity for the encouragement of the navy. On the first of July, 1800, the total number of guns on Danish ships, fit for service,

was one thousand seven hundred and thirty six, and of unserviceable guns eight hundred and eighty-two. Captain Hohlenberg had been appointed constructor of the royal navy in the year 1796; he travelled through the principal maritime countries in Europe, and returned to Denmark, where his genius and exertions were indefatigably and successfully employed. In the year 1800 it appears, from the above statement, that very nearly one-third (not as Mr. Andersen has erroneously stated *more than one half*) of the Danish navy consisted of ships incapable of putting to sea, being either entirely superannuated or standing in want of repair. On the 1st of July, 1802, the ships fit for service carried two thousand one hundred and eighty-two guns, and those in an unserviceable state one hundred and seventy eight only, which is not one-thirteenth of the whole. If this account is correct, however, it appears that the Danes had not yet employed all the guns from their unserviceable ships. The statement will stand thus:

July, 1800.

	Guns.	
Ships fit for service carried	1736	{ 2618
— unit for service	882	
July, 1802.		
Ships fit for service carried	2182	{ 2360
— unit for service	178	
	258	

Thus the numerical majority of guns employed in the navy was greater by two hundred and fifty-eight in the year 1800 than in the year 1802.

Within the same space of time the royal naval academy doubled the number of its midshipmen, a proportion of whom make an annual excursion on board a frigate to the Baltic, under the inspection of a superintendent.

"A battery called Proevesteen (the Touchstone) was erected in the sea, to the southward of the city, to prevent an enemy from bombarding the dock-yards, and other important places. The plan of this battery was laid before Christian VI. and approved by him the 2d April, 1742; a remarkable day, as the effects of that negligence which suffered the battery to go to decay, were most severely felt on the same day in 1801.

"To replace this battery, the Elephant, the Sound, and the Princess Vilhelmina were cut

down, filled with ballast, and grounded in the ruins, to raise a foundation for a new fort. This undertaking is pursued most zealously, and a few years will, I hope, exhibit as fine a battery there, as that we have to the north of the city, called the Three Crowns. This last battery was constructed at the distance of two miles from shore, on the plan of our ingenious Commodore Gerner,* who dying before it was completed, the battery was suffered to go almost to decay; but in 1801 it became an object of more serious attention. Upon the approach of the British fleet it was hurried into a state of tolerable defence, though unfurnished with either breast-work, or powder magazine. However, three furnaces were completed for heating balls, and the battery being fortunately made like a horse-shoe, with a tolerable large harbour in the centre, showers of shell, which would otherwise have annoyed the garrison very materially, only whistled by their ears, and buried themselves in the water.

"After the battle the East India Company furnished government with a large quantity of cotton, in bags, and many individuals collected empty sugar bags; they were filled with sand, which, with the cotton bags, made a most excellent breast-work all round the garrison. In two days every thing was disposed to meet whatever danger might occur.

"A project has, likewise, been attempted for the erection of a third battery on the side immediately opposite. Should this ever be accomplished, the Danish metropolis may be considered impregnable, as in the citadel, Frederickshavn, a line of formidable batteries have been raised just above the water's edge, which, together with the ramparts, are constructed so as to cross their fire with the batteries in the sea, though the distance considered, certainly with no great effect, unless particular circumstances should favour the entrance of an enemy to the inner roads.

"New batteries have likewise been raised on the new dock-yard and all along the coast of Amack, so that if the enemy, some years hence, should attempt making any impression on Copenhagen by sea, he would, upon the smallest computation, be welcomed with upwards of five hundred guns, most of which are long thirty-six pounders, independent of mortar, that throw shells of no less than one hundred and fifty pounds weight.

"Double ramparts have been elevated, and fosses dug from the batteries on the shore of Amack, adjoining the Baltic, down to the western gate, a distance of one and a half English miles.

"Thus the 3d of April, 1801, surpassed the uninterrupted calm of an eighty years' peace in yielding substantial benefits to Denmark, independent of the speedy re-establishment of

* Commodore Gerner died in 1784. He invented a machine worked by eight horses, which drains the royal dock in twenty-four hours; a task which formerly employed five hundred sailors incessantly for three days. I remember once to have been in this dock with two English sea captains, who paid many obliging compliments to the ingenuity of Gerner, and spoke in very high terms of the dock itself, altogether the labour of art; the tides not permitting us to establish similar docks to those in England.

that harmony which has so long subsisted, and which I trust Almighty God will ever preserve, between two nations, to both of which may, with justice, be applied the lines of Addison:

"Happy the people who preserve their honour;
By the same duties that oblige their pri- c.c."

In this devout wish we most sincerely join.

ART. XII. *Travels in Trinidad during the Months of February, March, and April, 1803, in a Series of Letters, addressed to a Member of the Imperial Parliament of Great Britain. Illustrated with a Map of the Island.* By PIERRE F. M'CALLUM. 8vo. pp. 354.

THE author of these travels was born in Scotland, and seems to have been engaged in commercial pursuits, from the familiar aptness with which he talks of every thing mercantile; he has resided much in the North American republic, visited San Domingo during the ascendancy of Toussaint, and went to Trinidad in February, 1803, to reconnoitre the capabilities of the place.

Trinidad, according to our author, was then governed by a Welshman, named Thomas Picton, who finding himself, in his civil capacity, intrusted by the Spanish laws with arbitrary powers of imprisonment and torture, and, in his military capacity, with a despotism not less formidable, gave the reins to his passions, in a manner more resembling the administration of Paris, where lewdness and rapacity are indulged without restraint, than the usual government of a British province.

Among the persons confined by order of governor Picton, was the author of these letters: the alleged motive of commitment was a contempt of court; but the apparent cause was a suspicion of what the governor called sedition, and jacobinism and disaffection. But we will borrow the author's own narrative.

"When the signing of the preliminaries of peace was announced in Trinidad, the inhabitants, actuated by a spirit of loyalty which diffused itself through all ranks, prepared a dutiful address to their sovereign, expressive of their strong attachment to his majesty's person and government, and praying him to extend, in due time, the blessings of a British constitution to Trinidad. The framers of this address were Messrs. Sanderson, Shaw, and Higham; the former a respectable physician, and the two latter engaged in mercantile pursuits,—all of them Englishmen born, warmly attached to the constitution of their native country, and of considerable experience in the colonies. As great pains have been taken to represent this address as the violent production of an intemperate party, calculated to disturb the peace of the colony, and to render the governor the object of public odium, I am happy in the opportunity of doing justice to the framers of it, by furnishing an exact copy; and I think you will agree with me in pronouncing it as loyal, constitutional, and

temperate: a petition as ever was framed on a similar occasion.

TO THE

KING'S MOST EXCELLENT MAJESTY.

"Most Gracious Sovereign,

"WE the principal freeholders, merchants, and other British inhabitants of the island of Trinidad, approach your majesty's throne with the most dutiful respect and affectionate loyalty, begging leave to present our unfeigned and earnest congratulations on the happy change which has taken place in the political affairs of Europe, among whose nations none have been so distinguished as your majesty's imperial kingdom, for that perseverance and success which have dignified your majesty's councils, and have impressed the world with an appropriate opinion of their wisdom and penetration.

"That so long and extensive a war should be closed by such a signal series of unparalleled successes, both by sea and land, and end in a peace so honourable in its terms, and so valuable by its addition to your majesty's dominions, is a consideration which must excite the proudest exultation in every British bosom, but more particularly affects the hearts of your majesty's most loyal subjects in this island, who feel, with inexpressible gratitude, the immense obligation which your majesty has been pleased to confer on them by your gracious solicitude to confirm this most valuable conquest, and add it to the other colonies so happily placed under your majesty's paternal care and protection.

"In thus venturing to address your majesty, we are emboldened by that gracious condescension and regard which it has been your Majesty's pleasure to extend on every occasion to your dutiful and loving subjects; and we most humbly beg leave to represent, that next to our most anxious prayers, which will be continually offered up to heaven for the long life and perfect health of the best of kings, and for the continued blessing of peace, we most earnestly hope your majesty will be graciously pleased, as speedily as in your majesty's wisdom may seem expedient, to complete the happiness which we already begin to feel under the cession of this island to our mother country, by extending to your faithful and affectionate subjects in this colony the privileges and protection of the British constitution, as experienced by a free representation in a house of assembly, and in a trial by jury: privileges which we inherit in common with

our countrymen under your majesty's mild and benevolent government in Great Britain and its numerous colonies.

"We most humbly beg leave to lay at your majesty's feet our warmest protestations of loyalty and attachment to your majesty's person and family, while we cherish the recollection of the happy events which confirmed the liberties of Englishmen, by placing your majesty's illustrious ancestors on the throne.

"That the blessing of almighty God may continue your majesty's health during a long and glorious life, and prolong the happiness and prosperous influence of your majesty's family over your majesty's united kingdoms to the remotest ages, is the devout and fervent prayer of your majesty's most faithful and affectionate subjects."

The signatures follow of one hundred and eight British planters and merchants. A comptroller of the customs had signed, but being threatened with the governor's displeasure, obtained the erasure of his signature. This address was left for subscription at the store of Messrs. Thomas Higham and Co.; and, after being signed by as many as chose, was confided to William Harrison, esq. A meeting of the addressers had nominated him as their chairman: half the persons assembled wished the address to be forwarded to a mercantile house in London for presentation: a majority of one voice decided that it should be given to the governor to be forwarded. This vote marked the persons who wished for a fresh governor. They thought fit to dine together at Wharton's tavern, in order to commemorate the annexation of Trinidad to the British empire. The governor heard of it, and sent word to the innkeeper that he should hold him personally responsible for any seditious meeting that might be held on his premises. Some gentlemen went to explain the innocence and loyalty of their object: the governor took from them their rank in the militia, and dismissed the custom-house officer who had withdrawn his signature to the address. Mr. Higham was arrested and led to the common prison, itself a sepulchre filthy and unwholesome in no common degree; and the author, who seems to have kept a club with the managers of this address, but who did not sign it, was also arrested and committed; and, after about a week's confinement, was shipped off for New-York.

This arbitrary banishment has not deterred Mr. McCallum from accomplishing a task for which he had been making preparations in Trinidad; he has proceeded

to lay before the public all the other tyrannies of the governor, of which he could collect accounts. The catalogue of accusations is so formidable and so horrible, that, if the common courts of justice do not possess a jurisdiction competent to the investigation, some parliamentary proceedings ought to be had on the occasion, that the colonial subject may in future know the formal method of redress.

Beside that portion of the letters which is devoted to the impeachment of governor Picton, they contain several instructive, novel, and curious particulars of a colony likely to become very important; being situate at the mouth of the Oronoko, and uniting to the common sources of tropical prosperity the command of a navigable communication with the interior of the South-American continent. Port-Espana will consequently be a great emporium; whenever the progress of settlement and civilization shall invite the shipping of Europe beyond the bocas (not *bocas*, as this author writes, the singular is *boca*) of the great river.

There is a resemblance between the usages of the people of Trinidad, and those of the ancient Greeks. When an European arrives, his first care is to purchase a concubine, of the black, yellow, or livid kind, from the priest (p. 39); or from the girl's mother (p. 79); or from stationary slave-venders. Auctions of naked slaves are frequent: the artisan fetches more than the husbandman. A belief in witchcraft is so prevalent, that negroes are tried and tortured for sorcery. The Sunday is observed like a pagan festival; goods are sold in the forenoon as on a fair-day; in the afternoon, songs and music, dancing and games of chance fill up the intervals of feasting: the rites of worship are pantomimic and idolatrous.

Trinidad produces fine grapes (p. 41); and might rival Madeira and the Cape in the production of dry and sweet wines. Surely the British legislature ought to withdraw a fourth of the present wine-duty, upon all wine grown and made in Trinidad. This will presently cover the country with colonists, and render us more independent of European agriculture. Besides, Trinidad may in time supply North America with an imitation of Madeira, if the fashion should deserve adoption in London.

"The following statement, though not perfectly accurate, will, however, tend to give

you an idea of the portion of land capable of cultivation:

	ACRES.
1313 Lots suitable for sugar	420,160
945 ————— coffee	302,400
158 ————— cotton	50,560
304 ————— cocoa	97,280
Total 2720	Total 870,400 acr.
Deduct 400 lots already granted by the Spanish government.	128,000
2320—So that the crown now holds	742,400 acr.

We wish that an increasing quit-rent, liable to be settled afresh by parliament every fifteen years, were demanded for the grant of colonial lands. Some land-tax ought to exist in favor of the state, as an indemnity for the expence of protection, and the risk of endowment. Duties on produce, which is our present plan of indemnification, divert mischievously the natural course of commerce, and will at last transfer it to that country which, by its internal economy, can afford to levy the lowest duties. Thus, the furs of Canada are now shipped in Philadelphia for China; and the return cargo is smuggled into Canada; the whole operation being conducted by British capital and for British provinces.

Some words are expended (p. 79); on the *cachexia Africana*, a disease of the stomach for which negroes seek a remedy in eating dirt. A West-Indian, with whom we have conversed, thinks it a disease which results from the excessive use of tobacco; an indirect debility of the stomach, brought on by intemperate smoking, a practice in which the negroes delight, and in which they are willingly indulged by their masters, who attend more than is imagined to the comforts of their dependents.

Of the general face of the country the following account is given:

"There are in this island three distinct ridges of mountains, the northern, middle, and southern, covered with incorruptible woods proper for ship-building. The rivers, several of which are inconsiderable, have been traced and examined as to what distance they are navigable; and a report has been made by Mallet, with respect to the improvements they may be capable of, by deepening their beds, making canals, &c. But as this man (though a creature of Picton) never discovered any talents, except a series of ill treatment towards his amiable wife, I do not imagine that his surveys merit any notice.

"The navigable rivers on the west coast which disembogue themselves into the gulf of Paria, are the Caroni, Gurracara, Coura, and Siparia; those on the east coast of the island are the Ortoire, Neg, Lebranche, and the Oropuche.

"Mr. Christie, a gentleman of considerable talents, in the surveyor general's department, is preparing to survey the river Caroni, a few miles distant from hence. This is the principal river of the island, being unavigable from its entrance to the Aripo, a branch of the Caroni, a distance of about twenty miles. The views of government are, to connect the Aripo with the Guaro, a branch of the Oropuche, also navigable to the sea, which will open a communication from the west coast of Paria to the east coast, or Atlantic; and also to clear the bed of the Caroni of the rubbish, so as to drain the great savannah before mentioned, which will be the means of not only rendering the Port of Spain healthy, but of facilitating an easy intercourse with the interior of the island. The river Ortoire, of Guatara, is the principal one on the east coast, navigable to Morne Orange, a distance of about twenty miles, having from two to five fathoms water; but as the mouth of this river is shoal water, it would be requisite to cut a navigable canal to the bay of Mayaro, which would give the facility of exportation to the production of an immense tract of cultivable land.

"In the bay of Mayaro, we find safe anchorage, having good holding ground, a fine bottom of sand and gravel, and may embark and disembark at any time of the tide.

"The Neg runs a short distance parallel to the shore, forming a sort of canal about six miles in length, which receives the waters of the Mangrove trees that spread over all this part. The water of this river is black, and so tainted, as to make the sea frothy all round its mouth.

"The Oropuche is navigable about ten miles on the banks of this river. A fine settlement might be formed, containing forty-five divisions, about 14,400 acres. The rivers Guaro, Siparia, and Lebranche, are insignificant, and hardly worth noticing, because neither of them are navigable above 6000 paces.

"There are several marshes; that of Caroni might be drained as well as those of Ortoire and Oropuche, but the marsh of Laguna Grande is inaccessible. The marsh of Icaque is level with the sea, in which there are two gulfs; one has an elevation of about seven feet, and the other twelve: mud and calcareous earth are continually gushing from them. In the months of March and June, the two principal months, they emit metallic particles, stones rounded by friction, and other heterogeneous substances.

"Rio Grande is a valley belonging to the crown, which lies about sixty-eight miles from this place, containing eleven divisions of three hundred and twenty acres each, with a fine

river meandering through it, having good anchoring ground, sheltered by a head-land from the north-east wind, and being healthy, it is remarkably well adapted for a white population. Ballandra is another place I deem equally advantageous, and not more than six miles from Rio Grande, situated on the south-east side of the island. The reason why I give the preference to these places is, not only their superior situation with regard to health, but their distance from any other settlement, which would prevent them from having any intercourse whatever with the corrupt society already mentioned, as—

‘Creeping in the putrid sink of vice.’

“I have just seen a considerable quantity of *petroleum*, *bitumen*, also called *pisaspaltos*, *carabe funerum*, *gunmi funerum*, *mumia*, *carabe* of Sodom, fossil pitch, and Jew’s pitch, a mineral sulphur, solid and light in substance, of a dusky colour on the outside, but a deep shining black within, having but little taste or smell, except when heated, in which case it emits a strong pitchy odour. It was brought from Cape de la Brea, situated in the western extremity of Laguna Grande, where there is a lake of it, elevated between seventy and eighty feet above the level of the sea. We are informed by Father Gumilla, that some little time before he came to this island (which may be reckoned nearly about seventy years), a spot of land on the western coast, about half way between the capital and the Indian village, sunk suddenly, and was immediately replaced by a small lake of pitch, to the great surprise and terror of the inhabitants. I suppose he means by the capital, the village of La Brea, for I do not know that any other petroleum lake is found in the island but the one above mentioned. The question now remains, whether this petroleum would not supersede the use of copper, for ships navigating these seas? If it would, what a great expence would be saved, not only to the nation, but to individuals. Surely the experiment ought to be tried.”

Accounts of the principal productions are given in the scientific form in which they appear in books of natural history: the author’s personal observation does not intervene much. There are many digressions which one would gladly spare: Pope and Pomfret, Armstrong and Goldsmith, could as well be quoted in a tour to Iceland as in a tour to Trinidad: all books are too large; let us have nothing unnecessary. The author is over fond of employing fine words, some of which he misunderstands: but he displays many kinds of reading, much information and experience, and a laudable zeal for public morality and political beneficence.

Although we have done with the traveller, we have not with his island. Trinidad is a recent acquisition, thinly and variously peopled, which is soliciting from the

hands of the British legislature new and purer constitutional laws. Why not make the experiment of a code more liberal to the black colonists, than that which has hitherto prevailed in the West Indies?

To the importation of slaves we are not about to object. The lands of tropical climates cannot be cleared and cultivated; and made profusely to contribute toward the sustenance of mankind, without the aid of that swarthy race, which nature has formed or seasoned for the hot latitudes. The venal negroes are slaves at home; like all the vulgar and uneducated, their memories have little tenacity, and they soon acquire as real an attachment to their new as to their original home.

But so soon as the imported slave is sold by auction, let him be termed a vassal. Let the act of his being purchased by a British land-owner better his condition, and confer some of the privileges of freedom. By passing from the hands of the slave-merchant to those of the planter, let him become, according to the apt definition of the Roman law, *ascribed to the soil*. Let him acquire a right of settlement on the estate to which he belongs; let the land which he is to cultivate be compelled to afford him a maintenance in the hour of disease, and during the twilight of decrepitude. This is West Indian law already in the chief point; and it is enforced: a Dutch planter of Demerary, whose black peasantry were so scantily provisioned during a scarcity that they begged for food in other plantations, had his estate taken away by the courts of justice for one year, and put under the care of trustees, who fed his vassals properly, and who accounted with him for the surplus.

The right of transferring vassals from one estate to another seems incapable of limitation, so long as the country is understocked with labourers. Whenever the number reared shall exceed the demand for labourers, the claims of negroes for maintenance on the estates to which they belong will become burdensome; and then, voluntary emancipations will abolish vassalage, in the same manner as it has been dropped in modern Europe. In the mean time vassals must be saleable between the planters; because the act of sale, transferring a claim of maintenance to a different tract of land, is as necessary to authorize migration, under the West Indian system of poor-laws, as a parish certificate here.

Something could be done in the new constitution of Trinidad to facilitate the acquisition of a *peculium*, or individual property, by the negro vassalry. At present, the blacks keep fowls and pigs, and out of savings so acquired purchase their little luxuries: but a specific price might be set on emancipation, so as to enable the industrious to buy their freedom: of this price a part should go to the state, which would thus be burdened with the maintenance of the free poor. We should find however, as in Poland and Russia, that it would only be worth the while of skilful mechanics, such as carpenters or blacksmiths, to incur the precarious subsistence of a free labourer.

Trinidad has the advantage over all the colonies of a larger proportion of female vassalry. The Spanish manners have founded a greater domestic demand for women, than our manners: we want labor, they want luxury. These manners should not be discouraged; they ought rather to be corroborated by a poll-tax on the male population; the multiplication of creole labourers being the radical and proper cure both for the slave-trade, and for colonial vassalage.

Some power must be conceded to the employer over his workman, analogous to that of a master over his apprentice; but this power ought surely to be restricted within narrower bounds than the vague but wide stretch allotted in the *Code noir*. In reforming the criminal jurisprudence which protects the negro, the cry of liberty, equality, and the rights of man, is, alas! still in its place. The doctrine of equality was originally a fiction or hypothesis of the civil lawyers, put for the purpose of ascertaining what is due to each, what ought to be commanded for every one. He who reviles this doctrine professes in the first instance to be a despot of justice; he may be a great statesman, as Burke was, but he cannot be a

man of principles. In Trinidad, we will not inquire farther, the violent death of a negro is not avenged like the violent death of a white; the one is but manslaughter; the other, murder. In Trinidad, torture may be applied to the negro; in Trinidad, sorcery may be punished on the negro; in Trinidad, flagellations, at which a regiment would mutiny, may be inflicted by the civil law, or without the civil law. Here is indeed a cruel change in the negro's condition. In his native country he enjoys trial by jury. When the grumeta draws a knife on his employer, a palaver is held. The master states his case and produces his evidences: the angry man is then heard, and his companions pronounce 'whether he has the reason.' The punishment is only inflicted if their verdict does not acquit. Why are not slave-drivers subject to a similar control?

This pursuit of the good opinion of one's companions, to which the native Africans are tremblingly sensible, is the most powerful stimulus to human excellence, and the basis of all the forms of ambition: of the descensive benevolence which scatters patronage, and of the ascensive benevolence which aspires to dominate. Men are most easily directed by their equals: trial by jury is the verdict of nature.

Under Adrian the murder of a slave was first punished with death; and the master accused of cruelty was compelled, on conviction, to sell the complainant. The successive extenuations of servitude between Adrian and Justinian merit the consultation and imitation of those houses of assembly, which have a similar population to govern. The protection of female chastity and of the rights of marriage was the latest improvement of their condition, and the pure gift of Christianity.

The appended map of Trinidad is not accompanied with a scale of distances.

ART. XII *Travels in Europe, Asia Minor, and Arabia.* By J. GRIFFITHS, M. D. Member of the Royal Medical Society of Edinburgh, and of several Foreign Literary Societies. 4to. pp. 400.

THE present volume, Dr. Griffiths informs us, is to be considered as the prelude to one of more importance, as 'the first link of the chain of observation which he has made upon men and governments.' But this greater work, which would include discussions upon the whole system of our Indian empire, and the laws

and manners of the Hindoos and Moslem subject to it, he will not venture upon, till he has ascertained the disposition of the public to receive his farther labours, by the reception which they shall give to this. In our last-year's* volume we advanced some opinions upon the business of periodical criticism, sufficiently appli-

* In the review of Tennant's *Indian Recreations*, p. 659.

cable to form a rule for conduct in the present case. If in works of fine literature there be a deficiency of taste or of genius, the critic has a right to complain; if in historical and scientific compilations he discovers a want of research and a want of industry, he is justified in resenting it as a want of honesty; in works like the present, where an author comes forward with an account of what he has himself seen or learnt in distant countries, if he finds any new information, instead of cavilling at the manner in which it may be conveyed, he ought to learn and be thankful.

Dr. Griffiths embarked in the summer of 1785 for the Mediterranean, with no other motive than his *'natural and irresistible inclination to visit distant and un-frequented countries'*; an inclination, he says, which very early persuaded him, that, with good humour, a spirit of accommodation, and an abundant share of patience, the difficulties of travelling might be surmounted, and many of its dangers avoided. The vessel touched at Genoa. On the situation of the slaves and prisoners here Dr. Griffiths makes some humane and interesting remarks.

"Humanity has reason to rejoice, that the disgraceful system of torturing the Turks and Africans, taken prisoners by the vessels of the Genoese Republic, is no longer pursued; and that throughout those states, now subject to Gallic influence, the horrible persecutions to which these unfortunate victims were exposed have totally ceased.

"Amongst the first objects I visited, on the morning after my arrival, were the prisons near the harbour. Here I beheld, I think, the very lowest pitch of human wretchedness and degradation! A number of aged Turks were chained to the wall, in stone recesses, at a short distance from each other; and some still more aged in cells, so low that they were never able to stand upright! Many of these men of misery appeared to have lost all sense or recollection; and one, who particularly attracted my attention, had counted no less than twenty-seven years of captivity! He seemed about sixty-five years old—his flowing beard was whitened by misfortune; and his sullen deportment indicated the rooted antipathy he so justly entertained against his inhuman Christian tormentors! Such was his prejudice, that he treated with contempt the trifling assistance I was disposed to offer him; and allowed it to remain upon the ground untouched, without even condescending to acknowledge it by the slightest gesture.

"Quitting this melancholy object with every feeling of humanity upon the stretch, I entered one of the galleys—Here was an assemblage of wretchedness one would think

sufficient to annihilate all idea of megrims; yet such is the accommodating spirit with which we are endowed by Providence, that even here I heard the sounds of joy and song and laughter.—Turk chained to Turk—Christian to Christian, and, by a refinement of cruelty, Christian to Turk; all were rivetted to the benches of the vessel—Here they worked and ate and slept; and waked to a renewal of the horrid circle of their employment!—Yet so little distressing to one fellow with whom I spoke appeared the life of a galley slave, that he had actually commenced a third term of seven years confinement for a very trifling remuneration—He had been first condemned to seven years punishment for criminal conduct—then served seven years for another person, and had, a few days previous to my visit, contracted a similar engagement. The only answer I could obtain to the few questions I ventured to ask him respecting his state was a kind of smile, and *Che vuole? Non mi dispiace tanto? If hat can I say? I dont find it so very disagreeable!*

"I was afterwards informed that this was not a very uncommon occurrence; and that even many of these poor wretches, becoming debtors to the government for some trifling assistance, or loan of money during the term of their imprisonment, were frequently obliged, upon failure of payment, to renew their services, and pass the remainder of their life in all the misery of a galley slave. The distinguishing appellation of these amateurs was *Buone voglie*, whilst those confined for crimes were termed *Forzatti*."

The use of proxies in England is not carried quite so far; indeed we have not deduced all the advantages from the principle which might legitimately follow. We indeed permit our *peers* to send their opinions upon great national subjects, and upon points of law which have passed through the inferior courts to their highest tribunal, taking it for granted that the arguments which might be advanced in debate could throw no new light upon the subject, and produce no change of sentiment—and that, so the vote be given, it matters not by whom. It is equally reasonable, and even more convenient for great men, to allow of punishment by proxy, according to the custom of Genoa.

Dr. Griffiths mentions it as a curious proof of inconsistent toleration, that a Mosque should have been built for the Mohammedan slaves, and the free exercise of that religion permitted them, for which they had been so unjustly deprived of liberty. Strictly speaking, war is not made upon the piratical states for their religion, but for their piracy. The moors of Barbary are the common enemies of civilization and of the human race, not merely of Christianity and Europe. We

do not say this from any wish to extenuate the folly or barbarity of a mere buccaneering war, but in the hope that the christian powers will one day, by common consent, and for their common honour, extinguish these despicable and detestable governments.

The game of *pallone* might advantageously be introduced among us by some fashionable traveller. Athletic sports are always useful, and this might have a fair chance of coming into vogue, as it would be new and foreign.

"A ball of leather, filled with air, and equal in size to a man's head, is propelled backwards and forwards by means of a wooden instrument fixed upon the arm of the striker, called *bruciule*. At a little distance it resembles a muf, but is covered with short wooden diamond-shaped points. The hand and arm being introduced into it, the player, by grasping a peg placed for the purpose across the internal part of the instrument, secures it firmly in its situation, and uses it with a dexterity truly admirable.

"The parties engaged generally consist of twelve, six on each side; and the object is to drive the ball into the adversaries ground, or as far distant from the adversaries themselves as possible."

The Italian hospitals are establishments of such magnitude and liberality, that even in England we have nothing which can be set in competition with them: no certificates or recommendations are required; sickness is a sufficient ticket of entrance: nor are the incurable ever discharged. We copy the remarks of Dr. Griffiths upon these excellent institutions, because such remarks should be as widely circulated as possible.

"In dwelling upon the excellence of the Italian hospitals, I do not wish it to be understood, that I hold such establishments, or the facility with which they may be entered, as a superior consideration in favour of the poor, to those regulations, in a general view, which have been adopted under the head of the poor laws in England; nor am I unconscious that, by the laws of England, every poor person, without the means of subsistence, inherits a right to support from his parish; that every magistrate is bound to convey to such parish the afflicted wretch discharged from an hospital, and that such arrangements have been made by the laws of the land, as humanity and justice could devise for the benefit of the distressed, so that parochial assistance should prevent the misery of dying from actual want of food. I am perfectly aware of all these advantages in England; but I still contend, that the sick man, who finds his misery a sufficient recommendation to ensure the attentions of medical men, and the means of support, so

long as he shall require them, is infinitely more fortunate than the sick man who, in consequence of the probably incurable nature of his complaints, is discharged from an English hospital, to be transferred from one end of the island to the other upon a waggon, because none but his own parish is compelled to support him.

"I contend, that those hospitals are to be preferred, where every day is a *receiving* day, to those whose gates are opened to the recommendatory letter of a subscriber only once in the week; and where, even on that day, the amount of the subscription is often considered of more importance than the disease of the patient, provided that disease be not of the most serious nature; in which case, I allow, that the humanity of our truly respectable physicians and surgeons always overbalances the pecuniary interests of the establishment.

"I am aware, that cases of accidents are received at all times, without recommendation, at all our hospitals; but is John with an intermittent fever on Thursday less an object of compassion than on the Wednesday following, which I will presume, for the sake of argument, is the established receiving day? Is William with an ascites, or Thomas with an erysipelatos inflammation, less entitled, by the severity of their sufferings, to an immediate endeavour at relief, than Richard, who has been thrown from his horse, and fractured his fibula?

"If it be pleaded, that the funds of our hospitals will not afford such general and indiscriminate admission of patients, and that, were every invalid to be received without formality, the establishments must be ruined, my observations are correct. Happy, I repeat, in *this particular*, is the country where the afflicted poor may be at all times well provided for by the benevolence of the rich, without waiting for a letter of recommendation, or a receiving day!"

Having reached Smyrna, the traveller proceeded to Constantinople. Often as this metropolis has been described, a city so interesting on every account, must still present something new to every traveller, however well informed. Dr. Griffiths pretends not to have penetrated into the seraglio,—indeed the sight of three heads with labels to them signifying to whom they belonged, lying at the gate of the inner court, might have cured him of any rash curiosity. Arguing from the impossibility which existed to himself, he attempts to discredit all descriptions of these inaccessible recesses. But the old writers to whom he alludes were men of veracity, and jewellers and physicians may have obtained access where a young and idle traveller would be excluded. He found the prejudices of Mohammedan pride and ignorance in full force; the true believers

had not then received those salutary lessons of European discipline and European strength which have convinced them that a horse in Egypt is not degraded by carrying a christian on his back. The *kaftan*, which has usually been represented as a mark of distinction, is, we are here told, rather a mark of subjection, it being a custom that every ambassador must be habited in the Turkish manner before he could be permitted to see the light of the presence.

The dishonourable dealing of the Turkish traders is thus extenuated.

“The censure which has fallen upon the Turkish and other Levantine traders, in respect to their attempts to deceive or cheat, by asking three times more than the value of the articles they sell, deserves some modification. —A Levantine trader fixes no precise price to his merchandise; his object is to obtain as much as he can; not so much *per cent. per annum* upon his capital: he is acquainted with no price current, no rate of exchange; and from a want of that regularity in business to which we are accustomed, sees nothing contrary to propriety in demanding a considerable sum for an article of inconsiderable intrinsic value; estimating its worth by the probable necessity of the buyer, and therefore not offended at any proposed diminution. —There does not appear to me, in this mode of traffic, any thing very repugnant to honesty, nor indeed very different from what every day occurs in commercial countries. —The distinction exists merely between the wholesale extensive monopolising advance in price of any article in demand, established upon a grand exchange by very rich merchants, who all participate in the advantage; and the temporary effort at emolument of a poor huckster in a boutique, desirous of obtaining a more than usual profit upon an article which, by the inquiry, he supposes absolutely wanted.”

The defence is admissible to a certain extent only. Actions considered singly are not the same as in the gross. An advance upon sugars, for instance, is a sort of authoritative act; —a tax laid by the West India merchants upon all tea-drinkers, which is openly enacted, falls upon each individual in due proportion, and aggraves none. But were the grocer to ask three times its value for a pound of sugar to every customer, and abate in his demand according to their pertinacity, this would be an act of personal knavery, which he himself would feel as such, and by which each person whom he succeeded in over-reaching would be personally injured. It is well known that men assembled in bodies will agree to actions of which each individual would be ashamed.

A mob will proceed to massacre, though every man among them would shudder at the thought of committing murder. We must distinguish between wholesale and retail wickedness, —between Alexander and the pirate. We must insist upon private honesty, though public honesty should be out of our reach.

At Constantinople Dr. Griffiths became acquainted with Mustapha Campbell, the Scotch Ghumbaragee Bashee, or general of bombardiers, of whom other travellers have spoken. This gentleman, or rather muselman, bore testimony to the truth of baron de Tott's story of the cannon, which has been so ignorantly and foolishly ridiculed as an extravagant falsehood.

An account of the Mohammedan religion is given at some length, avowedly abridged from D'Ohsson. Why has not the second volume of that valuable work been translated, or why was the first published in a style of such needless expence? The system of the Turkish government is better explained in Olivier's excellent travels. The state of the Turkish military force is copied with due acknowledgment from Mr. Eton, as is also a statement of the ordinary revenue and expenditure of the Porte, with a view of its debts and credits in 1776. As Mr. Eton's book is so very accessible, we could well have excused two quarto sheets of transcription from an *honest* octavo volume. But the most valuable information in this part of the book is that which explains the method by which the Turks endeavour to secure their property from confiscation. The only means of securing it, under a government so rapacious and so arbitrary, is by making it over to some religious or charitable purpose, in which case it is called a *wakf*.

“An established formality in bestowing property in *wakfs* requires that the donor should nominate a person, named *Mootouwalee*, to whose management the revenues are to be entrusted; and another called *Nazeer*, to whom the *Mootouwalee* is compelled to render up his accounts once in every six, or at farthest every twelve months. But as it is the peculiar characteristic of *wakfs* that the founder should be at perfect liberty in the choice of an agent or director, as well as in the disposal of his property, he has a right to unite both privileges in the same person. He may even reserve to himself the management of the estate, or grant it to his wife, to his children of either sex, or to his friend. A mode, therefore, presents itself, by which a considerable portion of his fortune may be ensured to the heirs of a family, since whatever property is not specifically disposed of in the act which

constitutes the wakf, becomes tacitly the right of the Mootouwaulee. I use the term *tacitly*, because it is presumed by the law that the Mootouwaulee expends for pious purposes, according to the suggestions of his own devotion, the whole of the wakf, although no positive application may have been made by the founder.

"The advantage which the most opulent officers of the Porte continued long to take of the facility with which they could evade the right of the sultaun to inherit their estates, became at last so evident, that the laws are now much more enforced than formerly; and whenever a person of rank dies, or, what is the same thing as to the sultaun's privilege, is disgraced, the whole of his property is seized, and a rigorous examination made respecting the wakfs with which it may be charged. When the residue of the fortune accruing to the family is found to be in a proportion not approved of, the sultaun, without ceremony, confiscates the whole estate for his own use, making it answerable only for the wakfs properly authenticated."

"The produce of the wakfs, with which mosques and other establishments are endowed, usually exceeds very considerably the expenditure which their maintenance requires; and the Mootouwaulee seldom scruples to appropriate the difference to his own use. Many of the imperial mosques have a revenue of twenty or thirty thousand pounds sterling, whilst their whole expences require not more than half, or at most two-thirds of this sum. The perquisites, which are therefore enormous, are divided between the Nazeer and Mootouwaulee, with little risk of discovery, as the government appears to be ignorant of the depredations committed, and no heirs of law are forthcoming to claim the unappropriated estate."

The wakfs of the mosques, which are continually increased by legacies, new endowments and good management, form no inconsiderable part of the ways and means of the Sublime Porte. The mufti, and the grand vizier, and the kislar agah are nazeers to most of the mosques in the empire; the kislar agah's chest in particular contains many millions of piastres. This fund is a never-failing resource. The sultaun borrows from it without hesitation, and the minister of finance engages to return the sum so borrowed.

There is another kind of wakf still more convenient.

"Formerly the mosques, which were sufficiently rich, were accustomed to purchase estates with the surplus of their revenues, for which they paid only half of the real value; but as a farther compensation, the seller was permitted to enjoy the possession of the purchased estate for a given number of years,

upon allowing to the mosque a very trifling rent.

"The proprietors of estates consented to this mode of disposing of their property, as much from a spirit of devotion as from the advantage of placing it beyond the grasp of authority; for the sale being duly registered with all the forms used at unequivocal wakfs, they were regarded merely as tenants. To ensure the tranquil enjoyment of these estates, it was particularly specified that a certain sum of money had been paid in advance, and that another, valued at a tenth of the annual value, mutually agreed upon between the parties, would be paid annually.—At the expiration of the stated term, the property so purchased devolved to the mosque; but if the possessor died previously to the date determined upon, the mosque invariably permitted the heirs of the deceased, or in default of heirs, those who farmed the collections of intestate estates, to enjoy the property till it became legally an appurtenance of the mosque.

"In this kind of wakf the repairs of the estate were always imposed upon the mosque; but as this circumstance gave rise to perpetual disputes, it frequently appeared that prevarications originated with the mosque as well as with the proprietors or their heirs; and the government was therefore induced to revise the laws, and improve those which should be found defective.

"By the laws now in force, it is enacted, that the mosques shall purchase these estates, whenever inclined, at a moderate rate; that the tenants shall be responsible for all repairs, improvements, or embellishments; and that the proprietors shall have the right of possession in perpetuity. These regulations are scrupulously attended to; and the method of arrangement is as follows:

"The proprietor of an estate makes a cession to a mosque under the title of wakf, for which he receives a sum of money, calculated at most at fifteen *per cent.* upon the real value of the property; sometimes at not more than ten *per cent.*—For two thousand pounds value, therefore, in land, the mosque pays only two hundred or three hundred pounds; and the seller, who is then considered simply as a tenant to the mosque, pays an annual rent to it, equivalent to the interest of the sum which he has thus received for his own estate.—The interest is calculated as the contracting parties may agree, but must not exceed fifteen *per cent.*

"This system will, no doubt, appear very singular to the reader: important advantages, however, result, not only to the mosque, but also to the founder of the wakf; for by these means the property is no longer liable to the common forms of civil law, and is sheltered as it were from every kind of seizure and confiscation.

"The founder esteems amongst his advantages, 1^{mo}, The right of continuing master of an estate, upon which he may reside, or

by which he may benefit by letting it to another.

"2do, That in case of debts contracted after the wakf has been legally made, no proceedings of common law can attach it, nor can any creditor pretend to claim a property which is adjudged sacred.

"3to, The right of transmitting to his children of both sexes the whole of his property, or rather the produce of this property, *in equal proportions*; whilst by the laws of the government no other property can be willed to his children but in the proportion of *two parts* to the males and *one* to females.

"4to, The right to mortgage, transfer, and dispose of his wakf by cession or otherwise as may best suit his convenience; subject however to a duty payable on these occasions to the mosque.

"5to, The privilege of not conforming to the law, which gives every proprietor of an estate contiguous to another about to be sold a preference to all other purchasers.

"The mosques, as may be naturally supposed, derive superior advantages.

"1mo, The funds employed at interest have an undeniable security in the estate mortgaged.

"2do, The mosque, not being any longer compelled to repair estates so purchased, economises considerably; and the tenant, who is most interested in their preservation, will necessarily attend to the amelioration of the property.

"3to, These repairs and embellishments, as well as every sort of augmentation which the tenants may choose to make, belong to the mosque by law.

"4to, The enormous receipts which accrue by the duty allowed by law to be levied at every commutation that takes place by a transfer of the tenant's privileges, change of Mootowaulce, or otherwise.

"5to, The essential advantage of inheriting these estates when ever the founder dies without children, the property then devolving, *ipso facto*, to the mosque; and no claims of the heirs at law, nor even of grandchildren, can be attended to:—Also of inheriting those estates for which the stipulated annual rent is neglected to be paid."

Particular care is necessary on the part of the wakf-maker in drawing out the deed of conveyance, as the law so far favours the mosques, that even a verbal disposition in their favour is admitted.

From Constantinople Dr. Griffith returned to Smyrna, and there met a young Swede, who was willing to travel with him to Aleppo. They made their arrangements with the owner of some horses which were engaged to carry merchandize to the metropolis of Syria, clothed themselves like common Greeks, and set out with the caravan, to encounter the diffi-

culties and dangers of an Asiatic journey. The mode of travelling and the accommodations on the road are well described.

"Caravanserais, or khauns, are most commonly large square buildings of stone and brick, appropriated at convenient distances on each road through the Ottoman empire to the service of travellers: they are frequently the gratuitous offering or legacy of the well-disposed; and sometimes a proof of paternal regard on the part of a patriotic sultan. They are generally rendered so far commodious, that round the inside of the quadrangle a story of chambers is built, where the traveller may repose without danger of those accidents from the horses, and other beasts of burthen, to which he is exposed below. The center of this quadrangle on the ground floor, which is open and not covered by a roof, contains the goods, and, when not completely filled by them, the horses, &c.; but it often occurs that some of the animals are brought upon the elevated bank which is continued on three sides (or on the four sides, allowing a space for the door) of this quadrangle, and destined for the travellers themselves previously to their retiring to their chambers. It is upon this elevated bank of earth that the meals are dressed, the pack-saddles, &c. deposited, and where the immediate attendants of the caravan remain as guards to the property. It is here also that all accompanying passengers must be contented to eat and sleep whenever the chambers above their heads are occupied, or where, as it sometimes occurs, no such chambers have been constructed. Fountains of water are often in the center of the caravanserai; never at any great distance: and these establishments, though rude and unequal to the comforts of an inn or a post-house, yet bear with them the stamp of civilization.

"It is usual for the caravan bashaw and his myrmidons to be on the alert before daylight, and no time is lost in loading the horses; when the whole proceed during four or five hours, then halting near a fountain or rivulet for about an hour, the rout is renewed till near sunset, or until some favourable spot is met with, which arrests its progress for the night. So many delays, however, take place, by stopping to shift, or secure the merchandise upon the saddles, to mend the miserable tackle with which it is fastened, and to wait for the conductor's business in the little villages upon or near the road, that the greatest extent of ground passed in one day seldom exceeds thirty, and is more generally under twenty-five miles.

"At convenient distances through all Asia Minor, and indeed wherever I have halted through the Turkish dominions, the erection of fountains, as well as caravanserais, denotes the attention which has been paid to the necessities of Mussulmans. Many of the former are built with elegance, and ornamented with inscriptions in gilded letters, allusive to

the founder, as well as to the principal article of the Mahommedan faith. An iron bowl, suspended by a chain, is always ready to assist the thirsty, and a flowing stream near it to supply their beasts. Very generally a hut, at no great distance, is provided with coffee, bread, eggs, and a distilled spirit they call *rakee*; or if the pious Muss-ulm un proprietor should be scrupulous on the subject of the last article, the traveller has only to wait until he meets with a Greek, who in every village may be found to furnish this pernicious, though on such occasions almost irresistible luxury."

On the fourth day they reached Sardis, now called Sart: the city of Cræsus is now a miserable village of clay huts, and the caravan halted amid the ruins of a palace. Their next stage was Allah-Sheer, the city of God, the ancient Philadelphia, still a populous place, where coarse cottons and carpets are manufactured, and the art of dying is better understood than in most parts of the neighbouring country. The Khans here are generally full of merchants, and the coffee-houses and baths well frequented. There are several Greek churches, and one which, though mean, is large, is called the episcopal; all indicate the state of wretched poverty in which the Greeks exist, and the bishop has few other comforts than those which he may derive from a conscious discharge of his duty. Here leaving Lydia they entered Phrygia, and proceeded to Aphiom-Kara-Hëssar, the old Apamea, built on the banks of the Marsyas, which falls into the Meander. The wool trade forms the chief occupation of the inhabitants, but great quantities of poppies are cultivated in the neighbourhood, and much opium exported. In this melancholy journey, through a country which has been, and which ought to be, the garden of the world, they saw little else than fine lands uncultivated, and villages in ruins. And now they were informed that the road to Koniah was dangerous, for an Aga with a troop of banditti had stationed himself about ten miles from the common route, and from thence infested the country. This alarm was not groundless; the banditti surprized them at their mid-day meal, and demanded money as duty for passing the confines of their Aga. One of these ruffians attempted to kill Dr. Griffiths, who owed his escape entirely to the protection of a hadgee in the caravan. His share of the misfortune, however, was not yet over. When supper was preparing, the Turks obstinately refused to let him and his companion partake, unless

they indemnified them for the loss they had sustained from the robbers. The reason assigned for this demand was quite satisfactory. "You are two infidels, who have been the cause of all our misfortunes, on account of our having had the weakness to allow you to come near us, and to travel with us. Mohammed has in his wrath punished us by permitting robbers to take away our property; and therefore unless you reimburse us for our losses, you must no longer expect to eat from our dish." Even the hadgee, who had given them his oath of protection, thought this a reasonable claim. They were to reach Koniah the next day, where they had letters of credit; their purse was light, their stomachs empty, for in the rencontre with the banditti they had lost their dinner, and they gave up all their stock of cash: it proved far short of the expectations of their companions, but they had honour enough left to accept the will for the deed, and allow them their share of the meal.

At Koniah, however, the travellers attempted to right themselves by complaining to the Turkish merchant to whom they were recommended from Smyrna; he replied that it was out of his power to enforce restitution, as the Turks would plead it was only their share of the loss, and he very sensibly advised them to proceed without exciting murmurs against them.

In this city is the great mosque of the Mewlewahs, the whirling dervises, an order instituted in the six hundred and seventy-second year of the Hegira, A. D. 1294, by Jelaulud-dinn Mewlana. This is the chief mosque of the order, and the schaik is obeyed with the most profound respect. The proofs required from a novice are sufficiently severe. He is obliged to perform the lowest services of the kitchen for a thousand and one days—a favourite number this it should seem among the eastern nations. An order called rufayees, from their founder Said Ahmed Rufayee, is distinguished for more extraordinary practices. After four scenes, as Dr. Griffiths calls them, in which they have to all appearance completely exhausted themselves by violent cries and motions, the fifth, which is characteristic of the order, commences.

"This is by far the most extraordinary, and cannot be witnessed without a degree of horror. The state of inactivity to which the dancers appeared to be reduced is now changed to one of ecstatic phrenzy, which they call *Haleth*. It is in the fervor of this religious de-

trium that they make their trials with red-hot iron.

"In a recess in the wall, near the seat of the schaik, cutlasses, and other sharp-pointed instruments, are suspended. Two of the dervishes, as soon as the fifth scene commences, take down eight or ten of these instruments, and, after making them red-hot, present them to the superior; who, repeating a few prayers, and invoking schaik Ahmed Rufayee, the founder, blows upon the heated iron, carries them lightly to his mouth, and then delivers them to those who most vehemently demand them. It is at this instant that these fanatics appear transported with enthusiastic joy: they seize the irons, look upon them with expressive tenderness, lick them with their tongues, bite them repeatedly, and at length extinguish them in their mouths! Those who cannot procure any of the red-hot instruments grasp the cutlasses with fury, and wound themselves in the side, arms, or legs.

"It frequently happens that they support these extraordinary tortures without the smallest expression of pain; but if they have not power to resist, and fall under the violence of their efforts, they throw themselves into the arms of a brother. In a few minutes the schaik visits them, breathes upon their wounds, anoints them with saliva, recites prayers over them, and promises a speedy recovery; which they pretend always takes place in twenty-four hours afterwards, when their wounds are no longer visible.

"The origin of these singular customs is said to be their belief that the founder, Ahmed Rufayee, in a moment of religious transport, thrust his leg into a fire, and was instantly cured of his wounds by the virtue of the breath and saliva of *Abdul Cauder Goolance*; from whom they imagine their founder received a similar power, which he at his death transmitted to all the schaihs his successors.

"The instruments made use of they call *gool*, which signifies a *rose*; meaning to convey an idea, that the use to which they apply them is as agreeable to the shrine of their elected chief, as the odor of the flower is generally acceptable to the voluptuous of the present age.

"It must be confessed, however, that great suspicions have been entertained of these dervishes employing some artifice in their exhibitions, as well as of their possessing secrets, communicated only amongst the elders of their order: but there can be no deception in the uncommon exertions and subsequent exhaustion from fatigue, which they publicly exhibit in the ceremonies above described."

From Koniah they proceeded with the caravan towards Erekle by Adana to the port of Karadash, and there embarked for Suediah, the ancient Seleucia, on the coast of Syria, and from thence once more proceeded with the caravan. On the way to Antioch, Dr. Griffiths and his Swedish friend were once more obliged to *pay duty*.

After leaving it they reached Martavaun, a place of which they had heard sufficient to excite the curiosity of the most torpid traveller.

"In truth, the extraordinary customs of the inhabitants are so irreconcilable to our ideas of propriety, and so diametrically opposite to every thing we imagine a principle of devotion, that were not the facts ascertained beyond a doubt by many authors of respectability, I should scarcely venture to expose my veracity to the suspicions which may arise from a detail of the occurrences witnessed.

"Upon entering the village the inhabitants flocked around us, and, before we could dismount from our horses, eagerly seized upon some part of our cloathing, and invited us to accompany them home. Men and women were equally solicitous and equally loud in endeavouring to attract our attention. Amongst them a well-looking man, in company with three or four females, not less favored by nature than himself, in spite of their olive-colored complexion, whispered into my ear the Turkish words, "*Keff-var, Keff-var-geld!*"—*Much pleasure awaits you, come with me!* My companion, as well as myself, was well disposed to enjoy the hospitable offer; and, resisting the repeated attempts of others to withdraw us from our exulting host, we entered the doors of his mud-walled residence. The women were dressed in loose vests, with a head-dress rising in a point, and unlike any we had seen: they were joyous, familiar, and vociferous. Unfortunately the conversation was almost confined to themselves, for of Arabic I understood not a word; and my companion, whose knowledge of the eastern languages was extensive, was too recently arrived to be familiar with the pronunciation of our new associates. The house continued a scene of hurry and activity, until a smoking piloh and a roasted kid engaged us all at the same table. A spirituous liquor was handed round, and the highest conviviality was manifested by all our hosts and hostesses, of whom we had three men and four women.

"After paying a serious attention to our meal, coffee and pipes succeeded. The men disappeared one after the other, then returned again amongst us for a few minutes; seemed amazingly well pleased with the jokes which circulated among themselves, accompanied by gestures evidently intended to impress us with the idea that we were perfectly at home; and at length we remained without interruption in the full enjoyment of the ladies' society.

"Such a contrast to the jealous prohibitions established throughout the countries in which we had travelled, and even to the prevailing manners of those immediately surrounding the village itself, was calculated to excite our curiosity as much as our surprize; and to have ascertained the reality of circumstances, which, when reported to us, we could only regard as the inventions of pleasantry or fiction, was a subject of astonishment which

afforded us ample room for discussion during the rest of our journey.

"In the morning we were greeted with the most friendly and obliging salutations. The women as well as the men accompanied us to the house where the horses had been put up; and a present of a few piasters to our liberal host closed their compliments and our adventure.

"The history of these people is still but little understood, although the Europeans resident at Aleppo have frequently paid a visit to the village of Martavaun as well as to that called *Teffen*, which, at a few miles distance, is inhabited by the same race. They are said to be a sect of the Anvarsians; a tribe whose origin is traced to an old man, who lived in the year eight hundred and ninety-one, at a village named *Nasar*, near Kouffia; and, amongst a variety of extraordinary tenets, a principal object of their devotion is the distinctive attribute of the female sex. From hence, as a natural consequence, may be deduced their religious attention to a multiplication of its enjoyments; and, with a pious regard to their opinions upon the subject, they embrace every opportunity thrown in their way by the arrival of strangers, without any kind of attention to their age, their rank, or their religion!

"They hold frequent assemblies, where promiscuous connection is the conclusion of such ceremonies as they have thought proper to adopt in the fulfilment of their worship: but what these previous ceremonies are, seems to be unknown, or involved in doubt and obscurity. The men are of much darker complexion than the women, and pay little attention to the external ornaments of their dress; which is similar to the common habit of the Arabs. Many of the women were not only clean, but much more attractive than has been expressed by several travellers, whose reports were rather grounded upon hearsay than positive evidence. Their limbs are finely formed, as is generally the case where nature is not confined by the trammels of dress; and their teeth are beautifully white."

In this part of Syria they met two of the sect called Yauzdia, who professedly address their devotions to Shitaun, Satan, or the evil spirit. Dr. Griffiths observes that there are other customs in the world as ridiculous, and more atrocious; he might have remarked that we have Yauzdia in England, who not only worship an evil spirit, but give him the name of the deity, and invest him with all the attributes of the deity—except justice, mercy, and goodness.

Dr. Griffiths arrived at Aleppo in so dirty and so *populous* a condition, that he was ashamed to visit the baths till the third day after his arrival, and even then in the

evening. Here he met with an adventure not altogether unlike the custom of sweating in the Spectator. A party of Turkish ladies meeting him alone in the gardens upon the banks of the Kowick, joined hands, and formed a circle round him; while others, who were at liberty within the circle, pushed him on every side, laughing violently at the sport. Had any Moslem come up, he would have been bastinadoed, or imprisoned, for undergoing this diversion, to which he put an end at last by forcing his way through.

Mr. H., one of the English residents at Aleppo, was at this time obliged by business to go to India, and wished Dr. Griffiths to accompany him, saying, indeed, that without him he dared not undertake it. The invitation was readily accepted, for it was indifferent to the traveller which way he went. Mr. H. took with him a daughter only seven years of age, because he could not bear to leave both his children. It is almost inconceivable that any man should thus needlessly have exposed a child to the dangers of such a journey.

"Mr. H. determined to take with us a horse of great value, to which he was partial: and a machine, called *mohaffah*, was fitted up for common use. This is formed of two boxes, about four feet in length, and eighteen or twenty inches in breadth. One of these is slung on each side of the camel; and, by means of uprights or posts fixed at the outside corners, a canvas covering is thrown over them, and shades the travellers from the extreme heat of the sun.

"To render this machine more commodious, the boxes are nearly filled with mattresses, but the movements of the camel prevent all comfort; and every time the forefeet of the animal come to the ground, the shock is similar to that which is experienced in the bow of a vessel when labouring against a head-sea; and in a few hours I was so bruised, that I quitted the *mohaffah*, and ever afterwards, even when the heat was almost insupportable, preferred walking.

"The provident care of Mr. H. had induced him to pack up a very excellent tent, some wines, liqueurs, butter, and a variety of dried articles; not forgetting a quantity of vinegar, alum, and a pair of bellows, for the purpose of purifying the bad water we had reason to expect."

The alum proved useless: it only removed one unpleasant taste, by communicating another which was worse. The journey was dreadful; the *Simoolch** frequently blew, and of the European travellers the child was the one who suffered

* Dr. Griffiths writes the word thus, after the excellent authority of Dr. Russel, changing only the final *y* into *ch*, as more analogous, he says, to the Arabic pronunciation.

least. Their stock of provisions ran low; and the salted tongues, with which they had absurdly provided themselves, proved of no use when water was scarce. The thermometer varied, during the day, from ninety-six to one hundred and four degrees; the nights were frequently cooled by northerly winds.

At length they came in sight of the grand dome and glittering minarets of *Mesched Ali*. Here Dr. Griffiths must relate his own rash and perilous adventure.

"My friend was almost exhausted by the pain and uneasiness he experienced; nor was I much less so: but a desire to explore (as far as was possible for a christian) the renowned tomb of the prophet Ali, held in estimation by the Persians with a zeal equally enthusiastic with that which the Hagees of Mecca entertain for the shrine of Mahomed, vanquished my disposition for rest, and, contrary to the advice of Mr. H. I set off alone for the village.

"It is seated upon an elevated ridge of sand hills: a tolerably good street runs nearly from south to north about three hundred yards. The houses on each side are flat-roofed; many of them being so constructed that their roofs are but little above the level of the street. To enter the habitable part of them, it is necessary to descend from the streets down several steps; so that one is apt to imagine the street has been formed between two rows of houses already built.

"After proceeding along this street, another turns abruptly to the right; and on the left of the angle is the grand entrance to the celebrated mosque. In a variety of shops, near the gates of the mosque, were exposed to sale water-melons and other fruits, as well as many dried grains: but in almost all of them the proprietors were reposing themselves; and on account of the extreme heat not a single person appeared walking in the streets. Being thirsty, I wished to purchase part of a melon, and addressed myself to a shopkeeper for the purpose; but taking me for a Greek, he loaded me with abuse, and refused to contaminate himself even by selling to me one of the articles on his shop-board. I retired without making him any reply; and, upon my return past his hut, observed he had again laid himself down to sleep. On approaching the gate of the mosque, I perceived that all the good Musulmauns, at each side of the entrance, were in the same drowsy disposition. Stimulated by an irresistible, yet unpardonable curiosity, I hastily walked into the first court. An elegant fountain, ornamented with coloured tiles, and a profusion of Arabic sentences, was constructed in the centre; and a corridor round the area afforded a shady walk to that part of the building, where two handsome doors led to the interior of the mosque. I went to that on the left-hand side; and finding no one at prayers, entered it far enough

to see the whole of the apartment. The dome is very handsome, but by no means so large as that of Saint Paul's, as colonel Capper judged it to be from its appearance at a distance. The mosque is richly ornamented with balls of ivory, glass, ostriches eggs, and a prodigious number of lamps, not only in the centre, but on every side. Very small-sized rich carpets covered the flooring, and two extraordinary large silver candlesticks were placed near the Mahareh.

"Apprehension of discovery now began to operate upon me, and I traced back my steps with caution, greatly dissatisfied at having found nothing extraordinary; but, before I could repossess the gate, an old man started up, and called to me in Persian. Not receiving any answer, he awakened two others; when they all jumped from the elevated part where they had been sleeping, and exclaimed most vehemently. One of them, armed with a scimitar (fortunately for me not unsheathed), and another with a short stick, made many blows at me; which parrying in the best manner I was able, although not so successfully as I could have wished, I dashed through these bearded heroes, and was assailed in my flight by many large stones, of which, for many days, I bore the marks."

As they advanced their sufferings became almost intolerable. The sand was so hot, that the horse was actually lamed by the burning heat of his shoes. The *Simoolah* became more frequent and more violent: the thermometer rose to one hundred and sixteen degrees; what little water remained was so thick and contaminated, that, parched as they were, they could not swallow it. For eight and forty hours they were in want of water, at length they reached the well, but not in time to save the life of Mr. H. He lived indeed to taste the water, and almost immediately expired.

The child, probably because she was in the mohaffah, suffered comparatively little from the poisonous wind. At length they reached the Euphrates; but though many of their dangers were over, the heat continued to increase. Fahrenheit's thermometer rose to one hundred and thirty-two degrees under the tent; and when exposed a quarter of an hour to the sun, to one hundred and fifty-six degrees. On the forty-eighth day after their departure from Aleppo they arrived at Bassora. Here Dr. Griffiths consigned his little charge to the commercial resident: she remained a few months there, and recrossed the desert under the care of captain Currie, who delivered her safely to her mother.

From Bassora Dr. Griffiths sailed for Bombay, and there his volume ends. We wish to see his remarks upon India.

This book is published in a manner unnecessarily expensive, which we notice, because it is becoming too much the practice for authors, or for booksellers, to make the public pay for blank paper. The three hundred and ninety-six pages of this quarto might have been comprised in a thin octavo volume, or even in a duodecimo, and that too in a type which would require no spectacles to magnify it. There is certainly no legal standard for printers measure, but there is a standard

of honesty to which every thing may be referred.

The prints in this volume are neither beautiful nor useful; they serve no other purpose than to enhance the price of the work. They have a bad custom, in arbitrary governments, of licensing books—they have also a custom of fixing the sum at which they shall be sold—our English publishers are proving that this custom is not quite so bad.

ART. XIII. *Letters from Paraguay: describing the Settlements of Monte Video and Buenos-Ayres; the Presidencies of Rioja Minor, Nombre de Dios, St. Mary and St. John, &c. &c. with the Manners, Customs, and religious Ceremonies, &c. of the Inhabitants. Written during a Residence of seventeen Months in that Country.* By JOHN CONSTANSE DAVIE, Esq. 8vo. pp. 293.

THIS book has, in some parts, a kind of romantic air, which prevents us from trusting implicitly to the information which it contains: it is evident, however, that the writer has described many things from actual inspection; and, as every notice concerning the state of Spanish America is highly interesting, we are much inclined to give the volume before us a welcome reception. The advertisement informs us, that

"The writer of the following letters, a gentleman of liberal education and considerable property, having been disappointed in his hopes of happiness with a beloved female, to relieve the distress of his mind, resolved to travel; and leaving this country for New York, on his arrival commenced a correspondence with his most intimate friend—Yorke, esq. of Taunton-Dean, in the county of Somerset, his half-brother. After remaining at New York a short time, he suddenly formed the resolution of embarking on a trading voyage to Botany Bay—with which these letters begin.

"Soon after they had sailed, a tremendous storm obliged the captain to alter his course, and make for the river Plata. They safely reached Monte Video, and afterwards went up to Buenos-Ayres, to repair the vessel; where Mr. Davie was seized with a dangerous disorder, which usually attacks Europeans upon their first landing in that country; and the captain, having repaired his damages and completed his stock of provisions, was under the disagreeable necessity of leaving him in the care of the fathers of the convent of St. Dominic, by whose unremitting attention he recovered in about three months.

"The jealousy of the Spanish government causing him, upon his recovery, to be confined to the limits of the convent, he, to obtain more liberty, took the dress of a novice; and, in consequence, after a short time was permitted to visit in the town, and soon after to attend father Hernandez on a visit to some

of the presidencies in the interior of the province of Paraguay, which were understood to be in an unsettled state: this enabled him to make many observations, which he took every opportunity of communicating to his friend in this country, through his agent at New York, by means of the American captains trading to South America.

"After his return to Buenos-Ayres, it is certain that he went to Concepcion, in Chili; as he was last heard of from that place, in the year 1803: but whether he lost his life in any insurrection of the natives, or was imprisoned by the government in consequence of his correspondence being detected, is unknown."

From this it is evident, that the friend to whom these letters are addressed is not the editor of them, and, of course, not responsible for their authenticity in the state in which they appear before the public. Another suspicious circumstance is, that the latest letter in this volume is dated May 1798, although we learn from the advertisement, that Mr. Davie was last heard of from Concepcion, in Chili, in 1803. Were no letters received during the whole of this interval, or have they not come into the possession of the editor?

Soon after Mr. Davie's arrival at Monte Video, he was seized with a dangerous fever, accompanied and succeeded by long-continued delirium, during which he was conveyed to Buenos-Ayres, and left at the Dominican convent there, by his friend the American captain, who was obliged to proceed on his voyage. From the monks, to whose hospitality he was entrusted, he received the kindest attentions, and finally got the better of his illness by means of an Indian remedy. Being thus left alone among strangers, and, in consequence of the war between England and Spain, being considered as

a prisoner, Mr. Davie was induced to retain the noviciate's habit, with which he had been clothed on his first reception into the monastery, in the hope of being allowed a little more liberty, more especially as he was looked upon by the good fathers as a catholic, in consequence of the following mistake.

"These reverend fathers regard me as a very pious and devout catholic. This strange prejudice I can no otherwise account for, than by their finding on my neck the precious cross worn by my lost —. I missed this valuable relic immediately upon regaining my senses, but was diffident of asking for it, as not knowing where or how I had lost it. However, when I was, in their opinion, sufficiently recovered, the jewel was restored to me, and in a transport of joy I seized and carried it to my lips. This motion of mine was attributed by the brethren to a motive of grateful piety, and they very readily conceived that I was one of their own persuasion."

This letter is dated June 1797, so that the subsequent events related by Mr. Davie occupy a period of only eleven months. The discreet conduct of the author, his attentions to his ecclesiastical superiors, and a well-timed present to the monastery, procured him the liberty of visiting a few of the principal families in the town, and of making little excursions into the neighbourhood. The country round is, for the most part, an immense savanna, extremely fertile, especially in those parts that are annually inundated by the river, and covered with luxuriant herbage, supporting large herds of wild cattle and horses, the descendants of those formerly imported hither from Europe. The cattle, however, are not so numerous as they used to be, on account of the devastation committed among them for many years past by the hunters, who destroy them by thousands merely for the sake of their skins, tongues, and fat.

Splendour, dissipation, idleness, and sloth, strikingly characterize the settlement of Buenos-Ayres; and the influence of the clergy being very great, the religious festivals are solemnized with unusual pomp. The account of the celebration of Corpus Christi day deserves to be extracted.

"The morning was ushered in by the ringing of bells, firing of cannon, and other similar demonstrations of joy. At ten o'clock, upon a signal given at the governor's house, the community prepared to join in the general cavalcade; and now, for the first time, I was to see the outside of the convent. We

were arranged in order, in a large square, within the gates: first, the young choristers were divided into four bands, twelve in each; these are the children under the tuition of the fathers. The first division was to precede the whole, singing a particular service appropriate to the day. On either side these children walked lay-brothers, bearing ensigns, or pictures representing the different achievements of their patron saint. Then followed the novices, among whom was myself; every one bearing some precious relic or another, enclosed in boxes of ebony and ivory, curiously wrought.

"To us succeeded another band of music, accompanied by all the visitors of distinction, of which there were not a few from the distant plantations. Next came the elder fathers of the convent, two and two, each carrying something relative to the festival; and after them the superior, dressed in all the regalia of his office, surrounded by the young students going to Cordova, and six lay-brothers, bearing banners. The remainder of the community, choristers, and several newly-baptized Indians, brought up the rear; every one in this procession being arrayed in their richest and gayest attire. The cavalcade, having cleared the convent-gate, entered a large handsome square; on one side of which stands the cathedral, a very fine well-finished edifice, crowned with a cupola, and open on all sides to the view. Round this square were assembled the societies of several other orders, all dressed in paraphernalia; and a more curious scene I never witnessed. It seemed as if people from all nations of the earth were collected together, presenting every different shade of the complexion, from the silver-haired inhabitant of Denmark to the sable-hued native of Guinea.

"Among the crowd some Indian caciques held a very conspicuous place. They wore party-coloured cotton habits, prettily decorated with a variety of feathers, arranged in a very judicious and elegant manner. Bands of wool, red, purple, and yellow, encircled their heads, and supported some of the most beautiful plumes I ever beheld. Several of the caciques wore glittering ornaments on their chins; others on their necks, arms, and legs. But if these Indians pleased by the gaiety of their attire, another tribe interested me no less by their simplicity. These were clad in white cotton vestments, with no other ornament than large full white feathers, rising one above another round the head. This dress, contrasted with the dark copper colour of their skins, was peculiarly striking, and gave a most singular, though extremely pleasing, appearance to the whole.

"The outsides of the houses round the square were hung with festoons of flowers, and live birds, tied with strings, to prevent their escape, but long enough to admit of their fluttering sufficiently to expand their beautiful plumage; a contrivance which I must confess had a very picturesque effect. The portico of the church was decorated with an uncon-

mon quantity of real and artificial flowers, in the disposal of which a great share of taste had been displayed. Under the principal arch was placed a band of musicians, who sang and played most enchantingly. Indeed there is not a place in the world, not even Italy, where sacred music is more studiously attended to. Upon a volley being fired by some of the soldiers—who were all drawn up on one side of the square—the procession commenced by the military, fully accoutred, marching off two and two, to the sound of drums, trumpets, and other martial music, at intervals halting, to discharge their pieces; the bells of all the churches ringing, and the ships in the harbour returning the fire in the town: so that altogether you may suppose the concert by no means a despicable one. First after the soldiers came the order of St. Francis, arranged in nearly the same manner as ourselves; then followed a second division of the military, and the choristers of the cathedral: to them succeeded the order of St. James; and, thirdly, we came in. Between our rear, and the advanced guard of the fourth community, was borne on a very high altar, richly decorated, the elements of the eucharist, surrounded by a vast number of people of the first rank and quality; some of them bearing lighted wax-candles, highly perfumed; others incense, many banners, and not a few relics: the whole group flanked by soldiers on horseback, in their newest and best attire, firing alternately to the right and left; and wherever a cross was erected, which I believe was at the end of every street, the whole cavalcade halted to sing the appointed service.

"After the eucharist came another division of soldiers, and after them all the remaining religious of the town; while on either side of the street—for we took the middle—marched the mobility, men, women, and children; but, notwithstanding their numbers, all ranged in regular order, and observing a profound silence, except when they joined in the general choruses, and then blessed St. Dominic. What a din was there! Each division of the whole procession was attended by a band of music, which, halting at the crosses, played almost divinely; and sorry enough I was, when the devotion of the multitude, breaking forth into audible sounds, spoiled such excellent harmony.

"The decorations of the houses in magnificence surpassed any thing I ever beheld in Europe on the like occasion. The streets are wide, and most of them in a straight line; the houses in general low, with here and there a very elegant church or public building, finished according to the rules of European architecture. Every habitation was hung either with tapestry or coloured cottons of various dyes, ornamented with feathers in a very ingenious manner; between which were suspended festoons of flowers, articles of plate, and even jewels, according to the riches of the owner. Across the streets, from side to

side, were triumphal arches, composed of boughs of trees artfully interwoven; from which hung, as at the portico of the church, a great variety of living birds, all suspended in the most advantageous point of view, and some of them beyond description beautiful. Between the arches were set out a vast quantity of eatables; such as cakes, pies, fruits, &c. all disposed in a very agreeable manner; and I could not help feeling a kind of peculiar *English pleasure* at this part of the exhibition. Close to the houses, on each side of the streets, were likewise placed living animals—young tigers, lions, wolves, dogs, and even monkeys of a particular large species—secured so carefully as to prevent any possibility of their escaping, or hurting those that might come near them. From the windows were suspended baskets, very neatly wove, of a lovely green colour, containing every kind of seed or grain with which they mean to sow the land, that the SAVIOUR OF THE WORLD might bestow his benediction on them as he passes, which they think will undoubtedly procure them a plentiful harvest; and indeed they are seldom, if ever, disappointed.

"There is not a street through which the procession passes but is adorned in this splendid manner: for on this festival the riches of every individual are displayed to the greatest advantage possible, and with a peculiar degree of art; which must, I should think, occupy a considerable time in preparation.

"In one of the streets leading to the great square I saw three of the largest and finest peacocks I ever beheld: also pheasants of an extraordinary size and beauty, not much unlike the peacocks in point of feather, but taller, with more slender legs; and in lieu of a long sweeping tail, small tufts of feathers, composed of dark brown, beautifully shaded with green and gold; but their eyes and plumage, in beauty and variety of colours, far surpassed any of the biped kind that had ever before met my inspection. They all appeared very tame; and, with several other large birds fastened in a similar way, were not in the least disturbed by the firing, the shouts of the multitude, or the trampling of the horses. The ground was all over strewed with herbs and flowers, so regularly disposed as to resemble, in many places, the most delicate Persian carpets. In fine, all the sweets of nature seemed collected in one spot, to honour the sacred festival: and a greater assemblage of people of all ranks, ages, and conditions, I never witnessed, even in the most populous city in Europe; nor so profound a silence and regularity, except when the pious responses were made.

"The governor was dressed in a rich Spanish habit, tastily ornamented with gold, jewels, &c. He was surrounded by a numerous and very splendid retinue, as none but the sick are exempt from assistance at this ceremony.

"When the procession reached the cathedral, the air was almost rent by the multitude

of voices; and we entered the edifice during a heavy discharge of artillery from the garrison and ships in the harbour, also volleys of musquetry from the soldiers in the streets. Here high mass was celebrated, and the sacrament administered; which ceremony, of course, occupied a considerable time, and when ended the different communities retired in the same order to their respective convents. The principal visitors and caciques are invited to the governor's, where a plentiful banquet is provided for them, composed of every delicacy the country affords. The eatables, &c. with which the streets were adorned are taken down, and distributed by the parish priests among the inhabitants, who entertain all strangers that choose to partake of them. At night there is a general rejoicing; when some very ingenious fire-works are displayed, and national games exhibited, such as hunting or baiting the wild bull, &c. and various martial exercises, in which the inhabitants of Buenos-Ayres particularly excel."

We are sorry to observe that the oppression of the Indians still continues in all its rigour, and that this is the cause of the comparatively good treatment experienced by the negro slaves: the cost of a negro is considerable, and therefore his purchaser is induced to use him well; but the poor native Indians, whenever they can be caught, belong to the government, and are consumed, without remorse, in the public works and private employment, by excessive labour and scantiness of food.

The empire established by the jesuits in Paraguay, although its destruction was apparently very complete, has by no means yet ceased to operate: the necessary tendency of this measure was to increase prodigiously the power of the military commanders, at the expence of the influence till that time possessed by the priests; the consequence of which is, that the ecclesiastics, in the distant *presidios* at least, are very discontented, and are intriguing both with the converted and unconverted Indians, to expel the military by force, and throw off their dependence on the governor of Buenos-Ayres. Some seditious movements among the clergy, in the settlements on the Uruguay and the lake Iberi, had particularly attracted the notice of government, and it was thought expedient to send, from the Dominican monastery at Buenos-Ayres, a respectable ecclesiastic, father Hernandez, to conciliate if possible the existing differences. Mr. Davie had the good fortune to prevail on the father to allow him to accompany the mission as secretary, and accordingly, in the month of September, he quitted the

capital with his associates, and commenced his journey. They travelled by land up the banks of the Plata, as far as the little harbour of Rio de las Conchas; here they embarked on board three balsas, or covered double canoes; and crossing the Plata, entered the Uruguay, a deep and rocky stream, and one of the principal contributors to the main river. The Uruguay abounds in fish, and its wooded banks swarm with game, and are infested by tigers, not indeed so formidable as those of Bengal, yet sufficiently fierce to exercise the skill and courage of the Indian hunters. After proceeding for some days up this river, they entered one of its tributaries, the Iber, and at length reached the lake Iberi, out of which the Iber flows in one direction, and an unnamed stream in another, that falls into the Plata at the presidency of Santa Lucia. The lake is above one hundred miles long, and forty wide: it is sprinkled with numerous islands, and on its fertile and wooded shores are established several flourishing settlements, at the principal of which, Rioja Minor, father Hernandez and his company took up their residence.

"This town is pretty large, and very regularly built. The streets, which are in the Roman style, exactly parallel, are divided by plantations of trees thick set, oranges, lemons, citrons, myrtles of every various sort, and scores of other odoriferous shrubs, which as you pass regale the senses most delightfully, and seem to give one a foretaste of those blissful regions where our religion tells us we shall rest for ever. Little currents of the purest water run with gentle rippings underneath the trees, over a smooth bed of small round pebbles. The houses are mostly built of clay, one story high, and covered with tiles; but the dwellings of the commandant, corrigidor, fiscal, and others of note, are higher, made of brick, and fitted up with every convenience. The public storehouse is in the centre of the town; it is one story high, very long and wide, divided into several apartments, so contrived as to receive every different article for use or barter. Formerly this storehouse was under the sole regulation of the rector, and by him only was the produce proportioned out to the different families; but now the Spanish commandant claims a share in the distribution."

The unusual alertness of the military clearly showed that mischief was apprehended, but for some weeks no disturbance took place: in January 1798, father Hernandez, accompanied by Mr. Davie, went, on account of his health, to the mineral waters of Ariciffe, near the presidency of Santa Maria, on the river Pa-

and; from this place he was suddenly recalled in the succeeding month to Rioja Minor, where every thing was in confusion. The father, on his arrival, found the monastery surrounded by a guard of soldiers, and that two of the principal ecclesiastics were under arrest on a charge of treason; this disgraceful circumstance, together with the fatigues of his rapid journey, affected so severely both his health and spirits, that he died in a few days, leaving the two parties in a state of the highest irritation against each other, which shortly concluded in the following tragical manner.

"Father Michael and father Joseph were placed in confinement, until the balsa should be ready to convey them to Buenos-Ayres. I was so much taken up with the illness and death of our good pastor, that I never even bestowed a thought upon these men until the morning after the funeral, when I sent to the commandant to request that I might be permitted to return with the prisoners to the convent of St. Dominic, if they were not already sent off; for not a single person had opened his lips to me on that or any other subject, save the death of the superior, whom every one lamented. The answer I received from Don Policarpo (the governor) was, 'that he should consider of my request; and in the mean time desired I would keep myself quiet with the other two brothers in the monastery,' round which I found the guard was still stationed. This answer of the commandant's somewhat surprised me; and about the middle of the day, after that on which it was sent to me, I was sitting in the apartment formerly occupied by the venerable Hernandez, reflecting on my situation, and wondering for what new vicissitudes I was reserved, when I was roused from my reverie by the loud confusion of an approaching multitude. Presently a signal-gun was fired, the drums beat to arms, and the piercing war-shout of the Indians burst upon my ears. I sprung in terror from my seat, and ran to the window; but it only commanded a view of the convent garden. I was therefore hastily returning to the door when it flew open, and the friendly Indian, who made my secret box for me, rushed into the room, followed by about twenty of the town Indians. 'Come with me, father Mathias,' said he—for that is my religious title—'for with us you will be safe.' 'What is the matter?' cried I; 'what does all this mean?' 'Father Michael and father Joseph,' returned he 'have been rescued from the balsas by some tribes of the wild Charuas: they have joined the town Indians, who have risen in a body, and are now surrounding every Spaniard's house; but I will preserve you.' Saying this, he threw part of a tiger's skin across my shoulders, and pulled me after him out of the monastery, and towards the strand. All we passed was tumult, horror,

and confusion; the military were flying in all directions, pursued by the Charuas, armed with long barbed darts, which they sent through the air with amazing celerity. The townsmen had taken possession of the signal post, storehouse, and arsenal, and being at the hour of siesta, all the Spaniards had been taken unprepared. This was the revolt which had been so long dreaded, and which the commandant too securely thought he had effectually circumvented through the intelligence received from the Indian. But this pretended confession, it now appears, was only a deep-laid scheme to deceive the commandant; the conspirators had foreseen the consequences, and provided accordingly. I perceived, as I passed along from the monastery to the water, that all who had not the whole or part of a tiger's skin upon their shoulders were immediately sacrificed either by the town Indians, who wore this symbol, or by the Charuas, who had theirs tied about their waists as their common, and indeed only, covering. When I reached the strand, the first objects I beheld were the dead bodies of the commandant and major-general, pierced in every part with darts and arrows. I have since learned they dragged the former from his bed, and massacred him; his wife and family were killed in much the same manner; and so sudden and unexpected was the blow, that not a single destined victim had escaped."

"On the sixth day in the evening, father Michael came to me, and apologised for not seeing me before, saying, that the many material things he had had to arrange alone prevented him. He then entered into a long dissertation on the necessity the town Indians had been under of adopting the decisive measures they had pursued, to obtain that liberty the state of Spain had so long deprived them of, and which it was their firm determination to secure against whatever steps the crown might have recourse to, to prevent them; for although they respected the laws, they were not disposed to abide by any but those they themselves should frame: their oppressors had reigned long enough, and they were resolved to enjoy their native freedom, or perish in the attempt."

The insurgents offered Mr. Davie a quiet residence among them, and even to secure his escape to England; but expecting to be appointed to a mission to Chili, he declined their offers, and was sent in a balsa to Buenos-Ayres, where he safely arrived in the month of May. Here the volume terminates. Besides the events, of which we have given a sketch, there are interspersed several interesting particulars relative to the manners of the Indians, and the police of the Spaniards; but these we decline to notice, conceiving it to be an injustice to the author to make any more extracts from a small book.

ART. XIV. *A Tour in America, in 1798, 1799, and 1800. Exhibiting Sketches of Society and Manners, and a particular Account of the American System of Agriculture, with its recent Improvements.* By RICHARD PARKINSON, late of Orange Hill, near Baltimore. (Author of the "*Experienced Farmer*," &c. 2 Vols. 8vo. pp. 735.

MR. PARKINSON ought to have entitled his work an *Agricultural Tour*; for it has no pretensions to have given a satisfactory account of any other phenomena than those which interest the farmer. But for the very reason that it selects for record and discussion such features of the country, as the author was peculiarly qualified to give a critical account of, it exceeds in value those superficial books of travels, which treat of every thing, and of every thing defectively. The farmer, who projects an emigration to North America, should study this work; it will deter him from executing the project, by the satisfactory detail of causes, why the agricultural profession neither is, nor is likely to become a profitable or pleasant employment, in any part of the United States which the writer visited. His tour is confined to the central provinces of the North American States.

The author embarked at Liverpool, landed at Norfolk in Virginia, went to treat with General Washington for a farm near Mount Vernon, and finally settled in the neighbourhood of Baltimore, in which town he sold a great quantity of milk. Concerning this sweep of district the account is ample, minute, instructive, and decisive.

Instead of a survey of the back settlements, some shocking stories are told of the atrocious conduct of the Indians in 1782, when they were said to have been hallooed upon the western settlers by the intrigues of the British: it is more probable that the usurpation of Indian districts, without orderly purchase, gave occasion to this savage warfare.

The author next travels to Philadelphia, Brunswick, and New-York, for the purpose of soliciting subscriptions to his reprinted *Experienced Farmer*. His social introductions are various, and the information collected is considerable for so cursory a three months journey.

His third tour is a circuit of three hundred miles, chiefly along the Chesapeake, through Annapolis; here, if any where, the author finds something to praise. The northern, the southern, the western states were never inspected: but as the tide of emigration from England mostly tends toward the country between New-York and

Baltimore; that territory is described concerning which information is most important on this side the Atlantic.

We learn in general that the soil is every where bad; labour every where dear; demand for produce every where narrow and precarious; necessities every where costly; and comforts wholly unobtainable: that farming on a small scale, or a large scale, is a losing trade; and that a farmer's family in reality subsists, not by the profits on his stock or capital employed, but by personal fagging, which, as all men's labour is well paid, may keep a family from starving. The roads are execrable; but the gentlemen hospitable. The people are insolent, dishonest, and rapacious. There are no poor-laws, no punishments, no schools. Civilization, which always proportions itself to the density of populousness, is retrogressive, and approaches nearer to a Russian than an English level: the symptoms of culture observable in the towns are due to the influx of foreign, chiefly Scottish, merchants. In short, such a picture as Bulow of Hamburg drew, in 1797, of the commercial interest of North America, is here drawn of the landed interest. Both authors agree that the price of land is on the decline; and that the inclemency and unwholsomeness of the climate are unconquerable impediments to the higher stages of cultivation and improvement. The country is not only bad, but unbetterable. The inhabitants are constantly crawling westwards, and at every remove sink lower toward poverty, privation, and barbarism.

In all this delineation there is evidently much of caricature; and a systematic wish and endeavour to curry favour with the Tories of England, by ascribing the evils of North America to its republicanism. To the doctrine of equality is attributed the insolence of the commonalty; to liberty, their improbity; to the want of a distinct exemplary class of noblemen, their vulgarity or rudeness; to the want of an established clergy, their ignorance. The author was pleased with Washington and Jefferson, and therefore omits to mention what they lose by wanting a king.

Those who are curious concerning American agriculture will, of course, consult

the book itself; we shall indicate only a few facts, which may supply hints for improvements at home.

In the Patowmak there are fresh-water oysters, large and fat: "the taste is watery and disagreeable to me, but not so to the Americans." Surely this sort of shell-fish might be reared in the inland lakes of Great Britain.

"There are great numbers of hogs, in general of a very inferior kind. The real American hog is what is termed the wood-hog: they are long in the leg, narrow on the back, short in the body, flat on the sides, with a long snout, very rough in their hair, in make more like the fish called a perch than any thing I can describe. You may as well think of stopping a crow as those hogs. They will go to a distance form a fence, take a run, and leap through the rails, three or four feet from the ground, turning themselves sidewise. These hogs suffer such hardships as no other animal could endure. It is customary to keep them in the woods all winter, as there is no thrashing or fold-yards; and they must live on the roots of trees, or something of that sort; but they are poor beyond any creature that I ever saw. That is probably the cause why the American pork is so very fine. They are something like the forest-sheep. I am not certain, with American keeping and treatment, if they be not the best; for I never saw any animal live without food, except this; and I am pretty sure they nearly do that. When they are fed, the flesh may well be sweet: it is all young, though the pig be ten years old; and, like pigs in general, they only act as a conveyance to carry corn to market. The sort of hogs I left in America pay the most for food I ever saw. I fed some half-bred ones, at six months old, that weighed ten stone each—fourteen pounds to the stone. With very little food and care, they kept fat in their growing state.

"I had a sow that yielded me one hundred and twenty-five pounds fifteen shillings in eleven months. I sold three hogs to general Ridgely for fifty-six pounds five shillings currency. The pigs were all sold from the sow at seven weeks old, except one. At two litters, she had only twelve, to make the sum."

This breed may be worth importing for the northern shires: where food is plentiful, the Java hog is the quickest fatter. A peculiar breed of chickens, which lay eggs all winter, also deserves attention: it is noticed page 299. The soft crab, and the canvas-back duck are mentioned as delicacies, which the curious in eating should import. The early white wheat is described, vol. ii. p. 322: there are many varieties of wheat cultivated in Sicily which are untried in America, or even in Great Britain; one so rapid of growth as to yield thrice in a year. To the hot

countries American farmers should address themselves for seeds and for precedents. Herd-grass, or swamp-grass, merits trial at home; and so does timothy-grass.

"The great advantage of herd grass is that it grows on swampy ground where water is liable to stand: it grows in those sort of swamps with such luxuriance in America, as to produce, it is said, a greater burthen than timothy; and is much superior in quality to either clover or timothy. It is a much finer grass than timothy, is better hay for cattle or sheep, is hardy to harvest; and, in growing, forms a sod, which mats the land over in such a manner, as to cause it to bear the pressure of cattle, horses, &c. though previously so soft as not to bear the footsteps of a man. It is the only grass that forms any kind of sod on land in America; for by nature I never saw a sod in the country, but where the herd grass grew. The earth is so loose as not to cause grasses to form a sod, as in England; the swamps are the very same."

The twenty-fourth section contains valuable reflections on the management of negroes, suggested by the inspection of those belonging to general Washington, of whom these curious particulars are given.

"I think a large number of negroes to require as severe discipline as a company of soldiers: and that may be one and the great cause why general Washington managed his negroes better than any other man, he being brought up to the army, and by nature industrious beyond any description, and in regularity the same. There are several anecdotes related of him, for being methodical. I was told by general Stone that he was travelling with his family in his carriage across the country, and arriving at a ferry belonging to general Washington, he offered the ferryman a moidore. The man said, "I cannot take it." The general asked, "Why, John?" He replied, "I am only a servant to general Washington; and I have no weights to weigh it with: and the general will weigh it; and if it should not be weight, he will not only make me the loser, but he will be angry with me."—"Well, John, you must take it; and I will lose three pence in its value." the ferryman did so; and he carried it to general Washington on the Saturday night following. The general weighed it; and it was not weight: it wanted three half-pence: general Washington carefully lapped up the three half-pence in a piece of paper, and directed it to general Stone, which he received from the ferryman on his return. General Stone told me another of his regularities, that, during the time he was engaged in the army in the American war, and from home, he had a plasterer from Baltimore, to plaster a room for him; and the room was measured, and the plasterer's demand paid by the steward. What the ge-

neral returned home, he measured the room, and found the work to come to less by fifteen shillings than the man had received. Some time after the plasterer died; and the widow married another man, who advertised in the newspapers to receive all and pay all due to or by her former husband. The general, seeing the paper, made a demand of the fifteen shillings, and received them. Another time, a man came to Mount-Vernon to pay rent; and he had not the exact balance due to the general: when the money was counted, the general said "There wants four pence." The man offered him a dollar, and desired him to put it to the next year's account. No, he must get the change, and leave the money on the table until he had got it. The man rode to Alexandria, which is nine miles from Mount-Vernon; and then the general settled the account. It was always his custom, when he travelled, to pay as much for his servant's breakfast, dinner, or supper, as for his own. I was told this by the keeper of a tavern where the general breakfasted; and he made the bill three shillings and ninepence for the master's breakfast, and three shillings the servant's. The general sent for the tavern-keeper into the room, and desired he would make the same charge for his servants as for himself, for he doubted not that they had eaten as much. This shews he was as correct in paying as in receiving.—It is said that he never had any thing bought for his use that was by weight, but he weighed it, or any thing by tale, but he had it counted: and if he did not find the due weight or number, he sent the articles back again to be regulated. There is a striking instance related of his condescendency: he sent to a shoemaker in Alexandria to come to measure him for a pair of shoes; the shoemaker answered by the servant that it was not his custom to go to any one's house to take measure for shoes. The general, being told that, mounted his horse, and went to the shoemaker to be measured.

"It may be worthy the reader's notice to observe what regularity does; since there cannot be any other particular reason given for general Washington's superior powers than his correctness, that made him able to govern that wild country: for it was the opinion of many of his most intimate friends, that his intellects were not brighter than those of many other men. To me he appeared a mild friendly man, in company rather reserved, in private speaking with candour. His behaviour to me was such, that I shall ever revere his name. Before he died, general Washington himself, with his own hands, closed his eyes and mouth."

At page 573 this author says he has recommended to government to prevent the emigration of uncertificated persons: the grant of this certificate to depend on the clergyman and overseers of the parish. The only just method of preventing emigration is to disseminate instruction. Let

extracts from Mr. Parkinson's book be reprinted in a cheap form, and read aloud from the pulpit of every Welsh parish, if it be necessary to resist, by active interference, the roaming tendency of the necessitous classes; but let no laws imprison the Briton in his country. Rather let us repeal those laws which already resist the exportation of mechanics and artisans, under a foolish and tyrannical pretext of their founding elsewhere our manufactures. Skill and industry being more highly recompensed in Britain than abroad will not find their account in emigrating; ignorance and idleness may well be spared, their migration will be an ease to the poor's rate. If they can dispose elsewhere of their reputation to more advantage, they have a natural right to carry it thither. Does Mr. Parkinson secretly mistrust the credibility of his own delineation of North America, that he thinks it needful to corroborate his arguments against emigration by new legislative restrictions?

The English farmer who wishes to remove, would probably find Ireland a more profitable resting-place than North America. There is much good land uncultivated, and still more ill-cultivated, for want of skill and of capital, in the western island. But the most patriotic speculation seems to be the enterprize of tropical agriculture. Trinidad is still to colonize, and the banks of the Essequibo. The same quantity of labour and capital applied in the warm countries increases much more rapidly the mass of produce and of wealth, than applied in the cold countries. We much wish than some such book as Mr. Parkinson's *Experienced Farmer* were drawn up in Jamaica or Demerary (it might be entitled the *Tropical Planter*), containing such plain directions for the culture of maize, cotton, coffee, indigo, sugar, &c. as should facilitate in new settlements the transfer of the agricultural arts. These things travel much too slowly. Mr. Thomas Cooper praised timothy-grass in 1794, Mr. Parkinson confirms the eulogy: yet timothy-hay is still to seek among the productions of English agriculture. A greater quantity of praise, of conspicuity, of noisy gratitude, must be awarded in favour of those men, who have the forethought and take the trouble to bring over useful animals and plants. Lucullus has been immortalized for introducing to Rome the cherry tree; and shall we reserve no recompense, not at least a parsley-wreath, for the brow who will introduce the American hen, that

lays eggs in the Christmas holidays? Perhaps Mr. Parkinson has the merit not merely of observing, but of bringing over several of these useful articles.

This book is not neatly put together. Some facts, as the effect of plaster of Paris on a turnip-crop in its early stage of growth, are repeatedly narrated. Some statements, as that concerning swamp-grass, are awkwardly interrupted to talk about sheep or the weather, and then returned

to again as unexpectedly. Some relations, as those concerning the Indian warfare, which do not repose on personal enquiries, and are disconnected with the chief topic, might have been wholly omitted with advantage. The grouping of topics, the treating of each thing in its proper place, is as favourable to compression as to interest. These two volumes reduced to one would form a completer work.

ART. XV. *A Collection of Modern and Contemporary Voyages and Travels: containing, 1. Translations from Foreign Languages, of Voyages and Travels never before translated; 2. Original Voyages and Travels never before published; 3. Analyses of New Voyages and Travels published in England.* Vol. 1, 8vo.

WHEN books of every kind are become so extravagantly dear, any plan which renders useful works more accessible is sure of our approbation. The plan of the present requires no explanation further than what the title-page conveys; it is a collection of travels, not a compilation, printed in a fair, clear, well-proportioned type, on good paper, each page containing more than two of such quartos as it not unfrequently falls to our lot to notice; yet the page is not crowded, and the letter not unpleasantly small. The contents of the volume must be noticed separately.

Travels in Istria and Dalmatia, drawn up from the Itinerary of L. F. Cassas, Author and Editor of the Picturesque Travels in Syria, Phœnicia, Palestine, and Lower Egypt. By JOSEPH LAVALLÉE, Member of the Polytechnic Society, of the Society of Arts and Sciences of Paris, of the Agricultural Society of the Seine and Marne, &c. Translated from the French.

THE first part of these travels, which contained an historical account of the countries through which M. Cassas travelled, has been omitted by the translator. We do not approve of such mutilations, but as this introduction was the work of M. Lavallée, the French editor, not of the author himself, it is of less consequence. The chapter abridged from it, which relates to the manners and customs of the Morlachians, is the most valuable in the whole.

The origin of this people is uncertain. They are dispersed over Dalmatia, though principally among the mountains in the interior, and extend towards Germany, Hungary, and even Greece. Two distinct races seem to be confounded under one name, the one of Celtic, the other of Asiatic physiognomy and complexion. These latter are the mountaineers, and the

least civilized. They are robbers by profession, but religious enough to prefer robbing Turks to Christians: the science of thieving is carried by them to the greatest possible perfection, and they resemble the Arabs in their inflexible fidelity when once their faith is pledged. They are remarkable also for hospitality, the virtue of barbarians not of savages; the Morlachian who has a good stock of provisions shares them with his neighbours, and partakes of their abundance in his turn; if he is in want he enters his neighbour's house, takes a place at the table, and remains as long as he pleases.

The custom of vowing friendship is very remarkable.

“Two young men, or girls, associate together; and their union is consolidated by a common education, custom, uniformity of character, and sometimes by those unforeseen and sudden emotions of sympathy, which often arise in the human breast. When two young persons agree to live in this kind of harmony, they repair to the church, accompanied by their relations; and the priest offers a benediction on the union, which becomes inviolable. Two girls joined in this manner, are called *posestrimé*; and two men, *pobratimi*. They are then inseparable for the rest of their lives: every circumstance has a common interest between them; pleasures, chagrin, dangers, injuries, and reverse of fortune; all, in short, is divided between the *pobratimi* and his comrade; and the *posestrimé* and her friend. Even the sacrifice of life has often signalled these ardent attachments; and, if two *pobratimi* should happen to dissolve their union, the event is regarded as a public calamity, and as the forerunner of some great misfortune with which the nation is threatened.”

But this singular custom is becoming of less effect as strong liquors become more common among them, and they get infected with the despicable vices of the Italians.

Revenge, a passion which needs no fostering, is inculcated as a duty. In case of a murder the bloody clothes of the slain are preserved by his family, and shown to the children. Forgiveness is unknown; they will in some cantons accept money as the price of blood, but otherwise vengeance is sure to be taken. The death of the offender does not put an end to the feud, his family inherit the danger. Some follow the Greek church, some the Romish, the priests of both sects being equally ignorant. The superstition of Vampirism prevails here as in Hungary and Greece; but the Morlachians, more prudent than their neighbours, take measures to prevent the mischief. Before the funeral they ham-string the corpse, mark certain characters upon it with a hot iron, drive nails into it, repeat charms over it, and then it is as peaceable in the grave as an obstreperous English ghost when laid in the Red Sea. What is the origin and where of this widely-extended and most horrible superstition? Their paganism, whatever it may have been, is not altogether forgotten; the names of their ancient gods are always repeated in the bridal song.

They have their minstrels or ballad-singers, whom M. Cassas calls chaunters, there is never a feast without one.

"The songs, which are in the Illyrian idiom, but corrupted by their transmission through a number of ages, describe the history of some Sclavonian heroes, or relate to some tragical event; the time of which is forgotten. This heroical song is grave, heavy, and monotonous. The instrument with which it is accompanied, is but little calculated to give it animation: it is a miserable monochord guitar; the sound of which is dull, and without modulation. The poetry, however, is not without energy: it does not possess the savage wildness of that of Ossian; but sometimes has that august kind of simplicity, which penetrates to the soul. If a Morlachian travel by night amongst the mountains, he generally sings; and these antique poems are always the songs which he prefers. A long exclamation, or rather a barbarous and prolonged cry, precedes each strophe. It often happens that this song is heard a-far off by some other Morlachian, who never fails to repeat, in the same tone, the couplet which the other has chaunted; and they thus answer each other as long as they can be heard. It is impossible to describe the species of sadness or melancholy, which this kind of musical dialogue spreads through the soul, the doleful expression of which is prolonged in echos by the desert mountains, amidst the profound silence and solitude of night."

Why did not M. Cassas collect some of

these songs? What a hint is here for some Italian Macpherson!

The women are hardly used; in this respect the Morlachians are savages, not barbarians. The wife never partakes her husband's bed, she is obliged to sleep on the floor, and the most disgusting employments and hardest labour is her lot. The children of course in such a state of society receive little attention, they are suffered to crawl about almost naked, and they who survive the seasoning become hardy and agile. Their common drink is milk made into whey with vinegar. Wine and peppet form their febrifuge; pepper and gun-powder infused in brandy their panacea; it will scarcely be believed, says the writer, that this remedy is often attended with success; perhaps, however, they are indebted for their cure to the abundant perspiration which it induces. Red ochre mixed with fat substances is the only ointment they apply to wounds and contusions; and it is a fact, he says, that from the experience of the Morlachians, some men of science have obtained from this ointment, in similar circumstances, the most favourable results. For rheumatism, to which they are very subject, they apply a heated stone wrapped in damp linen.

The travels of M. Cassas were performed in the year 1782; he was sent by a society of admirers of the fine arts to make views of the scenery and architectural remains in the vicinity of Trieste, which were to be engraved at Vienna, under the patronage of the emperor Joseph II. but the artist, finding that the coasts of Istria and Dalmatia abounded with rich remains of antiquity, resolved to extend his labours. The first place of importance which he visited was Pola, whose magnificent amphitheatre is now called the Orlandina; so named, he conjectures, by ignorant banditti, who admired the poem of Ariosto, and this guess is as good as any other. His coasting voyage was endangered not merely by the storms so frequent in those seas, but also by pirates, from whom he once narrowly escaped, lying hid in his vessel in a little creek, covered with trees, while the pirate boat brushed the very branches which concealed it. He examined the remains of antiquity at Zara and at Asseria, now called Podgrage, a place which strongly excited his curiosity, and made a short stay at Sebenico, next to Zara the pleasantest town in Dalmatia. They have a curious custom here of electing a king

at Christmas, whose reign lasts only a fortnight.

"For a length of time, this pantomimical king was chosen from amongst the nobles; but at present, they think it beneath them to amuse themselves with such buffoonery; and this chimerical crown has, therefore, devolved to what is called, in Italy, a man from the drags of the people. M. Cassas, who was at Sebenico only in the summer season, was not, consequently, witness to this ceremony; but Fortis asserts that this king, notwithstanding the short duration of his authority, enjoyed several prerogatives of sovereignty; such, for example, as that of keeping the keys of the town, of having a distinguished place in the cathedral, and of deciding upon all the difficulties or disputes which arise amongst those who compose his court. The town is obliged to provide him with a house suitable to the dignity of his elevated situation. When he leaves his house, he is always forced to wear a crown of wheat-ears; and he cannot appear in public without a robe of purple or scarlet cloth, and surrounded by a great number of officers. The governor, the bishops, and other dignitaries, are obliged to give him a feast; and all who meet him must salute him with respect. When the fortnight is at an end, the king quits his palace, strips off his crown and purple, dismisses his court, and returns to his hovel. On considering this ceremony, in a certain point of view, its folly might seem to have a philosophical end: it might furnish an annual type of the instability of human grandeur; but it is doubtful whether those who instituted it had such an idea in view."

Many instances of similar customs in other parts of Europe might be mentioned, resembling more or less the *Saturnalia*.

The cascade of Scardona is described at great length, and with much artistical enthusiasm; but mere description can give but very inadequate ideas of such scenery; and here, as indeed in most parts of these travels, we have to regret that the original work is not before us. We cannot form a fair opinion of M. Cassas, who is professionally an artist, when we read his description and do not see his views. The long account of Spalatro occasioned a similar regret, for the few aqua-tints in this publication, though to the full as respectable as can be expected, are of little value. In fact this is one of the books which should not have been included in such a collection as the present. What can be more ill-contrived than to put the volume of an artist of its prints?

One remarkable extract shall conclude our account of these travels; it describes the fall and loss of the Ruecca.

"This river runs between rocks of a considerable height, whose ruggedness is insurmountable, even by the most adventurous herdsman: above these rocks appear the antique and dismantled towers of the old castle of Novoscoglio, exhibiting the vestiges of savage feudalism, in the bosom of more savage nature. Not far from this spot is the village of San-Canciano, or Saint-Kosium, which is likewise situated on the summit of the rocks. At the foot of this village, the Ruecca affords to those who take delight in the phenomena of nature, a spectacle the like of which is seldom to be found in the world: in this part the fissure in the rocks is so vertical, that they appear to have been cut by the hand of man, and this steepness is every where alike, however various may be the lines which they follow in their super-position; but what adds still more to their singularity, is their summits, which are cut with a sort of symmetry, and appear like so many square towers, that command and seem to defend those gigantic walls, or they might rather be taken for battlements. At the base, that is to say, in the almost unfathomable abyss formed by these natural ramparts, the Ruecca winds and runs with a sort of majestic slowness, seeming to disdain the opposition of the blocks with which its bed is every where interspersed, till it suddenly arrives at an immense cavity, the frightful and sombre peristyle of a subterraneous gallery, of which the terrified imagination can neither guess nor measure the depth. In fact this gulph may be described as an enormous and inconceivable precipice, in which the waters of the Ruecca fall, with a tremendous noise, and are lost from the observance of man; but whither they go, to what depth they fall, or how long they have disappeared in this receptacle, he has never been able to ascertain, during thousands of generations, and many ages will doubtless yet pass away before this mystery will be discovered. No one can conceive the dreadful and incessant roaring of the waves, in the deep cavities of this impenetrable abyss, nor the terror which seizes on the spectator, at his first view of the gulph. It is here, by his unexpected humiliation, that man is compelled to acknowledge the limited extent of his mind; and though every where else he may be proud to think and act like a god, he here, perhaps for the first time, perceives his information to be only that of a subordinate creature. But this is not all, for the traveller, if he proceed no further, will have but an incomplete idea of the singular destiny of the Ruecca; he must, if possible, pass this mountain, or rather this gigantic wall, the fractured sides of which absorb the river. The other side affords a spectacle not less extraordinary, and perhaps still more wild; the same ruggedness and nudity in the rocks, but more disorder and confusion: the masses, which are equally vertical here, obstruct, intersect, and pass each other in various directions, while the summits frequently come in contact, and at other times appear at a considerable distance

from each other; in short, the whole presents the most shapeless and terrific chaos. It is in the midst of these numerous blocks, that the Ruecca, after meandering through the bowels of the mountain, issues violently from a deep and narrow fissure, and disgorge itself into a large basin, six hundred feet below the level of San-Canciano, which is so shaded by the elevation of the rocks, that it is constantly inaccessible to the rays of the sun. It is even pretended, that all attempts to ascertain its depth by sounding have proved ineffectual. In fact, this may be considered as the tomb of a river, so remarkable for its adventures: the threads of water which trickle from the overflowing of the basin, after having run for some time across the rocks that lie dispersed below this kind of crater, diminish till they at length become imperceptible, and thus the Ruecca disappears for ever."

The language of the translation is disfigured by inflated phrases. We are told that the Romans surrounded the town of Pola with their omnipotence, and we read of the *unfructuosities* of a rock!

Travels through Denmark, Sweden, Austria, and Part of Italy, in 1798 and 1799, by CHARLES GOTTLIEB KÜTTNER. Translated from the German.

Küttner is a good, sensible, plain matter-of-fact German traveller, who tells you all he sees, which is not so much as a man with better eyes would have seen, and all he learns by inquiry, in which he seems never to have been deficient. His book would be an excellent companion for travellers following his track, as it is full of useful information. Here again we have to complain of mutilation. The translator has judged it proper to dispense with the desultory observations on Hamburgh and other well-known parts of Germany, and has conducted the reader at once to the author's entrance into Denmark.

The account of Denmark is in general very favourable—such was the order, cleanliness, and comfort in the isle of Funen, that the traveller could have fancied himself in Holland; the smallest cottages were comfortable, there were no traces of opulence, and scarcely any of poverty. Copenhagen is described as one of the finest capitals in Europe. Every thing is extremely dead there; though I should spend more in the course of a year in London, says the traveller, yet here I consider many articles as dearer, because they are so much worse. Religion, he says, appears to be out of fashion at Copenhagen, as in most other places; this it should be remembered is the remark of a German. The royal library is one of the

most extensive in Christendom; it had just received an accession of one hundred thousand volumes. We have heard since that nearly that number of duplicates have been sold from it. But the most interesting institution is the lying-in hospital, where all midwives in the Danish dominions ought to have studied.

"This institution is properly a kind of foundling-hospital, in which mothers may not only place their children, but where they may also be delivered. All pregnant women of whatever condition, religion, or country, are admitted, without being asked any questions; they are even allowed to come in masks, and to retain them during their residence there. This building formerly had, in an aperture in the wall, a machine similar to those I have seen at Milan, and in other foundling-hospitals, in which a person may place the child, turn the machine inwards, then ring the bell and go away. This has however been removed; and the king has ordered every female who presents herself to be admitted, only with certain limitations as to time. Married women frequently apply for admittance; and, at their departure, are even at liberty to leave their children behind them. Women of rank and property frequently avail themselves of this general licence, because they here find better attendance, and superior conveniences, to what they could possibly enjoy in their own houses; and for which they, of course, pay. The best accommodations for ladies of this description cost fifteen dollars per week. There are other apartments for twelve, and others again as low as eight dollars.

"The lodgings of the unmarried are separate from those of the married women. In this regulation, I thought I discovered that a distinction was made between the children of love and the offspring of the marriage-bed, which, in an institution of this nature, appeared rather improper. I was, however, informed, that this regulation was introduced, lest the single ladies, by living among those who were married, might meet with some of their acquaintance, and thus be discovered. The apartments for twelve and fifteen dollars are handsome, and, in general, spacious and convenient. At my desire, I was shewn several rooms, for the reception of those who are gratuitously admitted into this institution; and found them all clean, commodious, and comfortable."

German is universally understood in this capital; it is but lately that the Danes have taken any pride in their own language; all the laws and public inscriptions are now in Danish, and they will soon have their own poets and historians. On the road to Elsinor he passed through the estate of count Bernstorff, who made all his peasantry free; at first they considered this as no great benefit, but they have felt:

its advantages, and have erected a monument in gratitude to their emancipator.

On entering Sweden an alteration was soon visible; the appearances of comfort and respectability about the cottages were not to be seen. The roads are even better than in England, unnecessarily good and numerous in a country of comparatively little trade, and thin population. In some parts nothing but Swedish was spoken, but Küttner confirms the observation so often made by others, that women understand every compliment paid to them, be it in whatever language it may. At Fredericshall he visited the spot where Charles XII. fell; the trophies and inscriptions which marked it have been all demolished, and in their stead nothing is to be seen but a wooden cross, painted white, on which is written *the siege*, Dec. 11, 1718. The traveller says 'that the king was killed by a musket-shot from the rampart, I have not the smallest doubt; for in my opinion the nearest part of it is scarcely six hundred feet in a direct line from the spot.' Without expressing any opinion upon this much-controverted question, we must remark that Küttner has been very easily satisfied. It is by no means proof enough that he was killed from the ramparts, to tell us that he was within shot.

The scenery in Norway is described as all travellers describe it; nothing can be more exquisitely picturesque. Government, he says, endeavours to prevent the improvement of the country; there seems no proof of the heavy accusation; if they have not thought proper to establish a university at Christiania, it may have been because the place would not support one. Mr. Coxe is often mentioned to be corrected.

Stockholm is well described; the account of the king's character is not pleasant, yet cannot be called unfavourable. He is said to be uncommonly grave, unnaturally it might have been said, if it be true that he has never been seen to laugh; his manners are cold and austere; even his former play-fellows have been severely reprimanded if they ever seemed to recollect that their sovereign had once been their friend. He dreads nothing so much as the idea that any person possesses or seeks to obtain an influence over him. But, on the other hand, he pays due attention to the finances of an impoverished country, and exercises a strict economy, the highest virtue which a king of Sweden can exercise at present, without the slight-

est derogation from a proper dignity and splendour. The opinion of his character may be misconceived, but the favourable account of his conduct rests upon facts which cannot have been mistaken.

The late king is said to have been a complete Frenchman in his taste. There is in the library at Upsal a large box, on which stands a smaller one, both secured with strong chains and locks. They were given by the late king to the university, with the injunction that they should not be opened for fifty years. Thunberg has given his beautiful collection to this university.

The Swedish manufactures are not in a thriving state; English goods are far better, and even when smuggled cheaper.

From Sweden he entered Germany. An account of the Herrnhutters merits transcription.

"The brethren's house, that is the house inhabited by the unmarried men, and where they all work for the general benefit of the society, has a mean appearance, both internally and externally. They have their common dormitory and refectory; but there are tables at different prices, which each is at liberty to chuse, according to his taste and abilities. Most of them are artisans; and the excellence of their work consists in a certain neatness, finish, and durability. But as the articles made here are on the whole better than those manufactured in other places, they are necessarily dearer.

"In the sisters' house every thing appeared to me to be on a better footing and a more extensive scale. The exterior is more respectable, the accommodations are superior, and the whole has a neater and more pleasing appearance. This is the habitation of the unmarried sisters, who are subject to regulations perfectly similar to those of the brethren.

"What made the most impression on me was the burying-ground, which is situated on an eminence, commanding the finest prospect of any in the vicinity of Herrnhutt. It forms an extensive square, inclosed by a hedge, and intersected by alleys; over each grave is placed a flat stone recording the name and native country of the deceased, together with the year in which he *went home*, or, as it is more frequently expressed, *fell asleep*. The graves in the principal line, nearly in the centre of this ground, were particularly interesting to me; they contain persons from every country in Europe, and I might almost say from every part of the world. On the most elevated point of this burying-ground a kind of pavilion or small wooden tower has been erected, the view from which is extremely beautiful.

"Do you know that the directors of all the congregations of the evangelical brethren in the world, reside in a village, two miles from this place! It is called

Bethelsdorf, and is by right the birth-place of the congregation, for it was there that count Zinzendorf collected the first Moravian brethren. These directors are called the Unity's Elders' Conference, which is generally composed of from twelve to fourteen persons, who never have any fixed place of residence. These govern the whole fraternity with unlimited power during a certain number of years, at the end of which a synod, composed of deputies from the congregations in every part of the world, is held, and a new *Elders' Conference* appointed. The members of this conference constantly remain together, and the affairs of the unity occupy their whole attention. In this conference the German nation appears to possess the same preponderance as the Italian in the college of cardinals; indeed, I am informed that all the members of the present are Germans."

The linen manufactures of Lusatia are on the decline. Great quantities were formerly exported to Spain and South America, but cotton is superseding linen. It is one proof of Bruce's wisdom that he foresaw this. 'Cotton,' he says, 'after wool should be the favourite manufacture of Great Britain. It will in time take place of that ungrateful culture flax; will employ more hands, and be a more ample field for distinguishing the ingenuity of our manufacturers.' The cloth fabrics flourish in Lusatia, improved by the importation of Spanish rams, and the increased attention paid to the breed of sheep.

The *Theresianum* at Vienna is justly censured by Küttner. This seminary for the children of the nobility was founded, as its name implies, by the empress Theresa, suppressed by Joseph II., and re-established by the present emperor. A more mischievous institution never was conceived by the spirit of aristocratical absurdity.

"The pupils are here separated, from infancy, from the rest of the world, that they may receive an education which, at every step, announces to them that they are beings of a higher order. On viewing the interior of the institution, the spectator is astonished at the elegant and extensive apartments of the abbot or prelate, who has the inspection of the whole; the vast and splendid halls in which the pupils dine, play at billiards, receive company, and occasionally give balls; the stables, which contain forty-six horses, and room for a greater number; the large riding-school, the spacious garden, the copious library, and the magnificent lecture-rooms. These young gentlemen daily have six dishes for dinner. Many of them will, probably, in the course of their future lives, be obliged to put up with less, and will here lay the foundation of discontent with their circumstances and

situations, that will embitter the remainder of their days. Many a future officer will here make a bad preparation for the want and the hardships which are so often inseparable from a military life."

"The pupils in general are never left by themselves, they are at all times obliged to conduct themselves like gentlemen, and are never suffered to indulge, free from restraint, in those childish sports and innocent diversions which constitute the delight of boyhood. In all the corridors, I observed attendants, and they appear to be watched in the strictest manner. This indeed is a method of preventing the extravagancies which boys in the English schools sometimes commit; but it is the liberty they enjoy that gives the latter that independence and firmness of character, which distinguish the English nation, and which it is impossible that persons educated in this place should possess."

The institution for the deaf and dumb is said to be more successful than that of the abbé de l'Épée. It is not perhaps generally known that the first person who carried this art to perfection, and probably the first who ever practised it, was Fr. Pedro Ponce, a Spanish benedictine of the sixteenth century. One of his pupils was an excellent Latin scholar, and had even acquired some Greek.

The mortality in Vienna exceeds that of any other place in Europe: the annual proportion of deaths is calculated at one in twenty, and Küttner thinks it is underrated. What can be the cause of this prodigious consumption of life?—Some anecdotes of Joseph are related, all highly favourable to his character. What is said of the reigning emperor is also in his favour; he follows the simple unostentatious manners of Joseph, and is beloved by the people. A proportionally greater quantity of animal food is consumed in Vienna than in London, not that the Austrians eat more, but because their poor eat meat, and the English poor do not. At Leoben the traveller heard dreadful anecdotes of the French; their atrocious conduct towards women exceeded any thing he had ever heard before. Throughout Styria the only complaint against the government was that it had agreed to the preliminaries of peace too soon, whereas if it had suffered the peasantry to oppose the French and defend themselves, it was confidently maintained that very few of the invaders could have escaped out of the country. Küttner himself thinks that the French army might have been destroyed.

He proceeded to Trieste and Venice, a city sadly changed from what it was.

"The contrast between the former and present times is no where so striking as on the grand canal, which is now very dead in comparison with what it once was. "What is become of all the gondolas which used to swarm on this canal?"—*La rivoluzione!* they reply, with an Italian shrug. "But there must yet be a great number of opulent families who pay visits, or go abroad to take the air!"—*Stanno in casa*—"They remain at home," is the answer.—"And the numerous boats and gondolas, which formerly rowed for wagers, while a crowd of loiterers ran after them? And the many gondoliers and boatmen who used to sing and laugh and joke of an evening?"—*Non hanno piu spirito*—"They have no spirits, or life."—I frequently become impatient at such unsatisfactory answers; but it is certain, that in these respects a great alteration has taken place at Venice."

From thence Kùttner returned by way of Padua, Verona, the Tyrol, Munich, and Ratisbon, to Hamburgh, where he concludes his travels. The book contains so much good sound information, that we are sorry it has been in the slightest degree abridged.

Travels to the westward of the Allegany Mountains, &c. By F. A. MICHAX.

A separate publication having been made

ART. XVI. *Travels to the westward of the Allegany Mountains, in the States of Ohio, Kentucky, and Tennessee: in the Year 1802. By F. A. MICHAX, M. D. translated from the original French, by B. Lambert.* 8vo. pp. 350.

THE name of Michaux is well known to the lovers of botany; and will ever be gratefully remembered by all who know how to appreciate the value of an enterprising and laborious life, devoted to the pursuit of natural science, with a continual regard to the general good of mankind. André Michaux, the father of our present traveller, having visited England, and traversed the mountains of Auvergne, the Pyrenees, and part of Spain, for the sake of improving his botanical knowledge, and as a preparation for more distant and more hazardous expeditions, in the year 1782 accompanied the French consul to Persia, under the patronage of Monsieur the present claimant of the crown of France; and spent two years in exploring the vegetable riches of that country, from the gulf of Persia to the Caspian sea. In 1785 he was sent by the French government to North America, with a commission to collect the seeds and roots of such plants as promised to be either useful, ornamental, or curious, if cultivated and naturalised in France. For this purpose he established gardens in the neighbourhood of New York and Charleston in South Carolina, and, during a

of another translation of this work, we shall refer the reader for an account of it to the next article.

The next portion of the volume is occupied by an itinerary from London to Constantinople in sixty days, taken in the suite of his excellency the British ambassador to the Ottoman Porte in 1794. It may be advantageously consulted by future travellers, but requires no farther notice.

The remaining articles are analyses of new voyages and travels lately published in London, a portion of the work which ought to be omitted. The editor asserts that his abstract of captain Woodward's narrative contains in the small compass of thirty-two pages every passage worthy of preservation in the whole work. How far this may accord with the custom of the more respectable London publishers we know not, but to us these kind of abridgments appear little better than piracies. These analyses should be dispensed with, and no retrenchments made from the other works—the publication would then really be valuable.

period of more than ten years, made numerous excursions over different parts of that vast continent, from the coast of the Atlantic to the banks of the Ohio; and from the Bahama islands and Florida to the upper part of the river which falls into Hudson's bay; and sent to his employers, from time to time, large quantities of seeds and young trees which have been propagated in France and other countries of Europe; these also he cultivated in his two American gardens, with the addition of many plants from the old continent, which he thought likely to flourish and become useful in the new. The disturbances occasioned by the French revolution obliged him to return home in the year 1796. But his ardent love of science did not permit him to rest satisfied with a state of inaction. Disappointed in his desire of a new appointment to North-America, he was induced to engage in a voyage to the Isle of France; and, unfortunately for the interests of science and mankind, in the year 1803 died of the country fever in the island of Madagascar.

Dr. F. A. Michaux, with whom we are at present more immediately concerned, appears to have inherited the public spirit

and intrepidity of his father, whom he had accompanied in his travels through several parts of North America. On that account he was selected by M. Chaptal, minister of the interior, to take another voyage to North America, for the purpose of sending to France the plants which remained in the two gardens, and of finally disposing of the ground. The garden in the neighbourhood of Charlestown, we are happy to learn, has been purchased by the agricultural society of South Carolina, and is still applied to the use for which it was formed by its philanthropic founder.

Dr. Michaux having some months to spare, availed himself of the opportunity to pass through the new western states, which, though traversed in part by his father, had not been visited by himself during his former residence in North America. The result is the work now before us. He modestly presents it to the public, not as a complete account, but as a relation of such particulars as occurred to him in a circuitous journey of eighteen hundred miles, through the country beyond the Allegany mountains, performed in the course of three months and a half, sometimes on foot, sometimes on horseback, and for 348 miles in a pirogue or canoe on the Ohio, either alone, or accompanied by such travellers as he accidentally met with on the way. As a further apology for the brevity of his narrative, he adds, that when he undertook the journey he had no intention of publishing his observations, and therefore omitted collecting a multitude of facts, which would now be pleasant to read, but which at that time he felt no inducement to write. His readers, however, will have the satisfaction to find, that though there are many things which they may wish had been told, they will meet with nothing that is trifling or of dubious authority. Dr. Michaux possesses a mind accustomed to accurate and extensive observation, which having taken for its ruling principle the benevolent sentiment of the comic poet, *humani nihil a me alienum puto*, is always awake to whatever may be conducive to the benefit of his fellow-men. In every part of his travels he attends to the natural advantages and disadvantages of the country, the direction and character of its rivers and mountains, its spontaneous productions, its population, agriculture, and commerce, the manners of its inhabitants, and the means which he thinks likely to better their situation, and make them more respectable and happy. His remarks are the more valuable, as

they relate to a country which has only just begun to be reclaimed from a state of savage nature, and is now advancing with unexampled celerity in the arts of civilized life.

From Philadelphia to Pittsburg, the place of his first destination, is three hundred and ten miles. As far as Shippensburg, one hundred and forty miles from Philadelphia, there is the convenience of a public carriage, of which, as that part of the road did not promise much that would be new, Dr. Michaux availed himself. At Shippensburg he joined in the purchase of a horse with an American officer, who had been a fellow-passenger in the stage, and they agreed to ride and walk by turns. After travelling ten miles they came to Strasburg, situated at the foot of the first chain of the blue ridges. This chain consists of three parallel ridges of equal height, separated by two small valleys thinly peopled, and distantly cultivated. The ascent of the first ridge is steep; and it cost our travellers three quarters of an hour to reach the top. Other ridges soon succeed, the intervals between which are filled with small hills, till at length the Juniata, one of the streams tributary to the Susquehannah, forms a larger valley, and affords room for a more numerous population. Beyond the Juniata are other ridges, the highest of which is the Allegany, the boundary of the eastern and western waters. It is ascended by a road extremely steep, which required a laborious march of two hours. On the western side the soil improves, and the trees in the woods are of a better kind and greater size. The Laurel hill, a ridge parallel to the former, derives its name from the *kalmia latifolia*, and *rhododendron maximum*, both of which are called laurels by the inhabitants, the former, eight or ten feet high, exclusively occupying every spot a little open, and the latter covering the banks of the torrents.

Dr. Michaux having been told that in Ligonier's valley, on the west side of Laurel hill, a shrub is to be found, the fruit of which yields good oil, his ever-active benevolence impelled him to go in search of a production which cannot fail to be of great utility, if to the valuable property of the olive there be added that of being able to bear the cold of the most northern countries. His account of the success of his expedition shall be given in his own words.

"The day after my arrival, I proceeded into the woods, and at my first excursion found the shrub which was the object of my

search. I recognized it as being the same which my father had discovered fifteen years before in the mountains of South Carolina, and which, notwithstanding his care, he could not make succeed in his garden near Charleston. Mr. W. Hamilton, who had also received seeds and shoots from this part of Pennsylvania, had not been more successful. The seeds become so soon rancid, that, in a few days, they lose their germinating property, and acquire an extraordinary acrimony. This shrub, which seldom rises more than four feet above the ground, is dioecious. It grows exclusively on mountains, and is only found in cool, shady places, where the soil is very fertile. Its roots, which are of a citron colour, are not divided: they extend horizontally to a great distance, and give birth to off-sets, which seldom rise to more than eighteen inches in height. The roots and bark yield a disagreeable smell on being bruised. I charged my host to collect half a bushel of the seeds, and to send them to Mr. W. Hamilton, pointing out to him the precautions it would be necessary to take to keep them fresh until they could reach him."

In the neighbourhood of Greensburgh, thirty-two miles short of Pittsburgh, Dr. Michaux discovered unequivocal marks of a mine of pitcoal, and was informed that this substance is so easily procured as to induce some of the inhabitants both of Greensburgh and Pittsburgh to burn it for cheapness. The road continues mountainous to Pittsburg, which is situated at the confluence of the Monongahela and the Allegany, whose united streams constitute the Ohio. The former of these rivers rises in Virginia, at the foot of what is there called the laurel mountain, which forms part of the western side of the Allegany chain, and is navigable to Morgan's town, one hundred and seven miles above Pittsburg. The settlements on its banks are numerous, and there are several small towns in which commerce is carried on with great activity. The source of the latter is fifteen or twenty miles from lake Erie. It is navigable two hundred miles above its junction with the Monongahela, and its banks begin to be tolerably peopled. The sugar maple, which is always a sign of a fertile soil, is very common in all the country, watered by the two rivers.

The Ohio at Pittsburgh is about four hundred yards wide, and vessels of a considerable tonnage are built upon it and the Monongahela. One of two hundred tons burden was launched at Elizabeth town, twenty-three miles above Pittsburg. When Dr. Michaux was at Pittsburg, there was on the stocks a three-masted vessel of two hundred and fifty tons burden, which he

afterwards learnt had arrived safe at Philadelphia, and which, before it reached the gulf of Mexico, had to make a river voyage of two thousand two hundred miles: and eleven hundred to the junction of the Ohio with the Mississippi, and nearly as much to new Orleans. The Ohio as far as Limestone, four hundred and twenty-five miles from Pittsburgh, is navigable for large vessels only in the spring and autumn, that is, during the months of April, March, May, October, and December: at other times boats of a moderate size pass with difficulty: but at these two seasons, the waters are raised to such a height that vessels of three hundred tons burden, steered by men well acquainted with the river, may descend with perfect safety. The passage up the river is of course difficult, and has not yet been much practised. When Dr. Michaux was passing down in 1802, they were sending cotton from Tennessee by the Ohio to Pittsburg for the first time, to be afterwards dispersed through the back part of Pennsylvania and Virginia. The boats were pushed up the river by poles, and went about twenty miles a day. The men who conduct the boats from Pittsburg to New Orleans have on their return either a fatiguing journey of fourteen or fifteen hundred miles by land, in six hundred miles of which they pass no white settlement, and only two or three Indian villages, or, which is generally preferred, take their passage by sea to Baltimore or Philadelphia. The principal articles sent down the Ohio to be exported from New Orleans to the West Indies are flour, hams, and smoked pork; and for the consumption of Louisiana bar-iron, coarse cloths, bottles made at Pittsburg, whiskey, and barrelled butter.

The current of the Ohio is extremely rapid in the spring; and the form of the boats which navigate it is calculated, not to accelerate their progress, but to counteract the swiftness of the stream. They are from forty to forty-five days in making the passage, but a canoe with two or three men will accomplish it in twenty-five. In the summer, on the other hand, except in the straits formed by islands, the current is slow. It was judged by Dr. Michaux, when he went down it, to be about a mile and half an hour. At this season its waters, owing to the heat of the climate and the slowness of the current, acquire so great a degree of heat, that they are not drinkable till they have been kept four and twenty hours in the shade; so that the navigator of a fresh

water river at the distance of two thousand miles from the sea, and compared with which our boasted Thames is but a brook, often suffers greatly from thirst.

Its banks, although from twenty to sixty feet in height, afford scarcely any stony substance in the upper part of its course. With the exception of some large, detached, soft, grey stones for ten or twelve miles, they appear to consist entirely of vegetable earth. A few miles above Limestone a calcareous rock of great thickness begins to appear. Two kinds of rounded flints are found in the bed of the river; one of a dark colour, easily broken, the other of a white semi-transparent quartz, smaller and less beautiful.

From Pittsburgh, for nearly three hundred miles, the Ohio runs between two ridges of hills of near equal elevation, which Dr. Michaux judged to be from three to four hundred yards. They are sometimes undulated at their summits, but often seem perfectly level for several miles, with occasional intervals, which afford a passage for the streams that fall into the main river. Their direction is parallel to the great chain of the Alleghenies, with which they are considered by Dr. Michaux to be connected, though sometimes from forty to a hundred miles distant from them. Between them and the river there are often flat spaces five or six miles broad, which are generally known by the name of *Rivers-bottoms*. They are covered with wood, and exceed in fertility, perhaps, every other part of the western territory. The greater part of the large and small rivers, which fall into the Ohio, have also their rivers-bottoms, but generally less rich than those on the main river. Dr. Michaux saw a plane tree, *platanus occidentalis*, on the right bank of the Ohio, which at the height of four feet from the ground, was forty-seven feet in circumference. It appeared to keep the same dimension to the height of fifteen or twenty feet, and then divided into several branches of a proportional thickness. The tulip-tree, *liriodendron tulipifera*, perversely called poplar by the inhabitants; is, next to the plane the largest tree of North America.

The banks of the river on both sides are covered with trees, which often constitute beautiful vistas. Dr. Michaux gives a lively picture of one near the mouth of the great Kenaway.

"For four or five miles the Ohio preserves its breadth, which is about eight hundred yards; and exhibits the most perfect alignment

on each side. Its shelving banks, rising from five-and-twenty to forty feet, as in the rest of its course, are planted at the bottom with willows, the pendant branches of which, and the clear green of their foliage, form a very pleasing contrast with the sugar-maples, red maples, and ash-trees, situated immediately above them; and these, in their turn, are overtopped by the plane, the tulip-tree, the beech, and the magnolia, which occupy the highest elevation; the large branches of these, attracted by the brighter light, and the more easy expansion, incline towards the sides, covering the trees situated below them entirely, and even stretching much farther over the river. This natural disposition, which prevails on both banks of the river, forms a regular sweep on each side, the image of which, reflected by the crystal of the water, embellishes this magnificent prospect."

Both banks of the lower part of the Monongahela, as well as those of the Ohio, till it takes a southerly direction, belong to the state of Pennsylvania, and are advancing fast in population. The town of Pittsburg in 1802 contained about four hundred houses. The remainder of the country between the Alleghenies and the Ohio to its junction with the big sandy river, where its course becomes westerly, is in the state of Virginia. The greater part of it is so mountainous, that it is settled only a little way up the subordinate river. But the banks of the Ohio, which till 1796 and 1797 were so thinly peopled, that there were not more than twenty-five or thirty families in a space of near four hundred miles, have since that time attracted so many emigrants, that the plantations are at present not more than from one to three miles asunder; and some of them are always within sight from the middle of the river. Dr. Michaux is persuaded that its future progress will keep pace with its late rapid increase.

"The position of this river, the most happy which can be found in the United States, will cause it to be considered as the centre of activity of the commerce between the eastern and western states: it is by it that the latter receive the manufactured articles furnished to the first by Europe, India, and the Antilles; and it is the only channel of communication open with the ocean, for exporting the produce of that vast and fertile part of the United States, comprized between the Allegheny mountains, the lakes, and the left bank of the Mississippi.

"All these advantages, added to the salubrity of the climate, and the beauty of its situations, enlivened, in the spring, by crowds of loaded boats, hurried on with incredible rapidity by the current, and by the extraordinary spectacle of vessels of heavy burden,

which proceed directly from the middle of this vast continent to the West Indies: all these advantages, I say, make me look to the banks of the Ohio, from Pittsburgh to Louisville, both included, as being likely to be, within twenty years, the most populous and most commercial part of the United States. It is also that to which I should not hesitate to give the preference, in chusing my place of residence."

Of the state of Ohio, which has but lately been received into the union, Dr. Michaux saw only the settlements on the right bank of the river, its boundary from the states of Virginia and Kentucky. Marietta, situated at the confluence of the great Muskingum with the Ohio, one hundred and eighty miles from Pittsburgh by water, is the chief establishment in this state. It has not existed fifteen years, and the number of its houses was in 1802 more than a hundred. The Muskingum rises near lake Erie, is navigable two hundred and fifty miles from its influx into the Ohio, and is there three hundred and forty yards broad. The seat of government is at Chillicothe, on the great Scioto, about 60 miles from its mouth. The banks of this river are said to be almost as fertile as those of the Ohio: but as they are lower and more humid, the inhabitants are subject to obstinate intermitting fevers in the autumn, which do not cease till the approach of winter. Chillicothe contains about a hundred and fifty houses.

At Limestone Dr. Michaux left the Ohio, and proceeded by land through the state of Kentucky to Nashville in the state of Tennessee. Kentucky was discovered in 1770 by some Virginia hunters. At that time it was not occupied by any Indian nation, but left by general consent as a common hunting ground for the Indians, who carried on a war of extermination against all who attempted to settle there: on this account it was called Kentucky, which in their language signifies the land of blood. No fixed establishment was formed in it till 1780. In 1782 the number of its white inhabitants was about three thousand: in 1790, one hundred thousand: at the general census taken in 1800, it was two hundred and twenty thousand: and when Dr. Michaux was there in 1802, the population was, estimated at two hundred and fifty thousand, including about twenty thousand negro slaves. This rapid increase would have been still greater, if it had not been for the growing difficulty of ascertaining the titles to the land, occasioned partly by the knavery of the land-dealers, and partly

by the unskilfulness of the surveyors. Frankfort is the seat of government, but is less populous than Lexington, which contains about three thousand inhabitants, and is the oldest and most considerable town in the three new states. The greatest length of the state is four hundred miles, and its greatest breadth about two hundred. In its whole extent it seems to rest on a bed of perfectly homogeneous limestone, which in some of the deep channels of the rivers is exposed to view to the height of three hundred feet perpendicular: the vegetable earth varies in thickness from a few inches to twelve or fifteen feet. There are also numerous explored mines of coal, but with the exception of a few iron mines, there is scarcely any other mineral substance in the country.

The land in Kentucky, as well as in some of the Atlantic states, is divided into three classes, which are differently assessed to the land-tax: but the same kind of land is there put in the second class, which east of the mountains would belong to the first; and in the third, which in Georgia and Carolina would be assigned to the second. There is, indeed, some land in the eastern states as fertile as any in the west; but it is not common, and is seldom met with but by the sides of rivers and in the vallies.

"In Kentucky and Cumberland independently of a few trees, which are peculiar to these countries, the mass of the forests, in lands of the first class, is composed of those species which are very rarely met with, to the east of the mountains, in the most fertile soils: these species are principally the following: *Cerasus virginiana*, cherry tree; *Juglans oblonga*, white walnut; *Paria lutea*, buck eye; *Fraxinus alba*, *nigra*, *cerulea*, white, black, and blue ash; *Celtis foliis villosis*, ackberry; *Ulmus viscosa*, slippery elm; *Quercus imbricaria*, black-jack oak; *Gaultheria dioica*, coffee-tree; *Gleditsia triacanthos*, honeylocust; and, *Annona triloba*, papaw, which rises to the height of thirty feet. These three last species, in particular, denote the richest lands. In cool mountainous places, and by the sides of the rivers which have not steep banks, there are also found the *Quercus macrocarpa*, over cup white oak, the acorns of which are as large as a hen's egg; the *Acer saccharinum*, sugar maple; the *Fagus sylvatica*, beech; and also the *Platanus Occidentalis*, plane; the *Liriodendrum tulipifera*, white and yellow tulip-tree; and the *Magnolia acuminata*, cucumber-tree, the three last of which attain to a circumference of eighteen or twenty feet. The plane, as has been mentioned before, grows to a larger size. The two species of tulip-tree, with white and yel-

low wood, have no external character, either in the leaves, or in the flowers, by which they can be distinguished from each other, and as the yellow wood is most used, before a tree is felled, a piece is cut out, to ascertain whether it is of this species.

"In the lands of the second class, are found *Fagus castanea*, chesnut; *Quercus rubra*, red oak; *Quercus tinctoria*, quercitron; *Laurus sassafras*, sassafras; *Diospyros virginiana*, persimmon; *Liquidambar styraciflua*, *Nyssa tillosa*, gum-tree, a tree which neither yields gum, nor resin, as its name seems to imply.

"Those of the third class, which are generally arid and mountainous, scarcely produce any but the black and red oak; the *Quercus prinus montana*, rocky oak, some pines, and sometimes Virginian cedars.

"The *Juglans pacane* is not met with nearer than the mouths of the rivers Cumberland and Tennessee, from whence the fruit is sometimes brought to Lexington market. Neither does this tree grow to the eastward of the Alleghany mountains. The *Lobelia cardinalis* grows abundantly in all the cool humid spots, as well as the *Lobelia spilitica*; this is more common in Kentucky than in any part of the United States which I have seen. The *Laurus Benzoin*, spice-wood, is also plentiful here. The two genera, *Vaccinium* and *Andromeda*, which constitute a series of more than thirty species, and are very abundant in the eastern states, seem, in some degree, excluded from those of the west, and the calcareous district, in which only the *Andromeda arborea* is found."

The barrens or meadows of Kentucky comprize an extent of sixty or seventy miles in length, to fifty or sixty in breadth.

"From the signification of the word," says Dr. Michaux, "I expected to cross a bare tract, with a few plants scattered here and there upon it: and in this opinion, I was supported by the notion which some of the inhabitants had given me of these meadows, before I reached them. They told me, that, at this season, I should perish with heat and thirst, and that I should not meet with any shade the whole length of the road; for, the greater number of the Americans, who live in woods, have no conception that countries can exist which are entirely free from them, and still less that they can be habitable. Instead of finding a country such as had been described to me, I was agreeably surprized to see a beautiful meadow, well covered with grass, of two or three feet in height, which is used to feed cattle. A great variety of plants also grow here, among which the *Gerardia flara*, gall of the earth, the *Gnaphalium dioicum*, white plantain, and the *Rudbeckia purpurea*, were at this time predominant. I noticed that the roots of the latter plant have, in a certain degree, the acrid taste of the leaves of the *Spilanthes oleracea*. When I crossed these meadows, three-fourths of the plants had

done flowering, and the period of the maturity of the greater part of their seeds was still far distant; I, however, collected about ninety specimens, which I have brought to France.

"In some parts of these meadows, several species of wild creeping vines are met with, and particularly that called by the inhabitants, *summer grapes*. These grapes are as large, and of as good a quality, as those from the vineyards in the neighbourhood of Paris, with this difference, that they are not so close upon the bunches."

The remarkable nakedness of this and some other similar tracts of a country, which in its natural state is one thick forest, had before been attributed by Volney to the custom of burning the grass every spring, practised time out of mind by the Indians, and continued by the white settlers. Dr. Michaux, who does not seem to have been acquainted with Volney's conjecture, was led to form the same conclusion by an observation which occurred to him incidentally, in a future part of his journey.

"At a short distance from Machy, on the river Holston, fifteen miles from Knoxville, the road, for the space of a mile or two, runs beside a coppice; very thickly set with trees, the largest clumps being twenty or twenty-five feet across. I had never seen any part of a forest in a similar state; and I made this observation to the inhabitants of the country, who informed me that this spot was formerly part of a *barren*, or meadow, which had become naturally recovered with wood within the last twelve or fifteen years, since the bad custom of setting fire to them, as is practised in all the southern states, had been discontinued. This example seems to prove, that the extensive meadows of Kentucky and Tennessee are indebted to some conflagration, which had consumed the forests, for their origin, and that they are preserved in that state by the custom, which still prevails, of setting fire to them annually. When on these occasions chance preserves any spots of them for a few years from the ravages of the flames, the trees spring up again; but, being extremely close, the fire, which at length catches them, burns them completely, and reduces them to the state of meadows again. Hence it may be concluded that, in these countries, the meadows must continually encroach upon the forests; and, in all probability, this was the case in Upper Louisiana and New Mexico, which are only vast plains, to which the savages set fire annually, and where there is not any tree."

The elks and bisons, which formerly abounded in this country, are almost all gone over to the right bank of the Mississippi: the only species of wild animals which are now common are the deer; the bear; the wolf; the grey and the red.

haired foxes; the wild cat, which is either the Canadian lynx or a variety of it, and not, as has sometimes been supposed, the origin of the domestic cat of Europe; the racoon; the opossum, and three or four species of squirrels.

"The wild turkies, which begin to be very scarce in the southern states are plentiful in those to the westward. In the most uninhabited parts they are so tame as to be easily killed with a pistol-shot. In the east, on the contrary, and particularly in the neighbourhood of the sea-ports, they cannot be approached without difficulty: they are not alarmed by a noise, but they have a very quick sight, and as soon as they discover the hunter, fly away with such rapidity, that it takes a dog several minutes to come up with them; and when they see themselves on the point of being caught, they escape by taking to flight. The wild turkies generally remain in the swamps, and by the sides of rivers and creeks, and only come out in the morning and evening. They perch on the tops of the highest trees, where, notwithstanding their bulk, it is not always easy to see them. When they have not been frightened, they return to the same trees for several weeks in succession.

"To the east of the Mississippi, in a space of more than eight hundred leagues, this is the only species of wild turkey which is met with.* They are larger than those reared in our poultry yards. In autumn and in winter they feed chiefly on chestnuts and acorns; and some of those killed at this season weigh thirty-five or forty pounds. The variety of domestic turkies, to which the name of English turkies is given, in France, came originally from this species of wild turkey; and when they are not crossed with the common species, they retain the primitive colour of their plumage, as well as that of their legs, which is a deep red. If, subsequent to 1525, our domestic turkies were naturalized in Spain, and from thence were introduced into the rest of Europe, it is probable that they were originally from some of the more southern parts of America, where there doubtless exists a species different from that of the United States."

Many horses are bred in Kentucky which find a good market in the southern states, particularly South Carolina: the number of horned cattle is also considerable; but very few sheep are reared. Dr. Michaux travelled upwards of two hundred miles in this state, and saw but four plantations at which there were any. Their flesh is not much in esteem, and the wool is of the same quality as that of the sheep in the eastern states.

The cultivated produce is chiefly tobacco, hemp, flax, and the different grains of Europe, but principally maize and wheat.

Whisky is distilled from oats, and brandy from peaches. Except a few apple-trees, the peach is the only fruit-tree which has hitherto been raised in the country. An attempt, indeed, has been made by a Swiss settler to establish a vineyard, and great expectations were formed concerning it; but the experiment has not succeeded, in consequence of the humidity of the atmosphere occasioned by the vicinity of the forests. Dr. Michaux is of opinion that the barrens are much better adapted to this purpose than the spot which has been chosen on the banks of the river Kentucky.

The manufactures carried on at Lexington are those of writing paper, ropes, tanned leather, nails, pottery ware and gunpowder. The sulphur for the last is obtained from Philadelphia, but the saltpetre is the produce of Kentucky and Tennessee, and has hitherto been fabricated in no other part of the United States. The earths which yield the lixivia are obtained from the grottoes and caverns, formed on the declivities of high hills, in the most mountainous parts. They are very rich in the nitrous principles, which is evidently owing to the calcareous rock, from the decay of which all these excavations are formed, as well as from the vegetable substances which are accidentally driven into them. This, Dr. Michaux observes, seems to show that the assimilation of animal matters is not absolutely necessary to produce a greater degree of nitrification even in the formation of artificial nitre-beds.

These manufactures are said to answer notwithstanding the extreme high price of labour, and the scarcity of handicraft workmen, owing to the general preference given to agriculture. To render the defect of artisans in the west country more perceptible, Dr. Michaux gives the following comparison:

"At Charlestown in Carolina, and at Savannah in Georgia, a white workman, such as a joiner, carpenter, mason, white-smith, taylor, shoe-maker, &c. earns two piasters a day, and cannot live a week for less than six. At New York and Philadelphia he receives only one piaster, and it costs him four per week. At Marietta, Lexington, and Nashville in Tennessee, this workman receives a piaster, or a piaster and a half per day, and can live a week upon one day's wages.

The state of Tennessee is bounded to the north by Kentucky, to the west by the Ohio, to the south by that nominal part of Georgia which is reserved for the territory

* There is one specimen of a female in the collection of the Museum of Natural History.

of the Cherokee and Chactaw Indians, and to the east by the Alleghany mountains, which separate it from Virginia and North Carolina. It had not acquired population enough before 1796 to be admitted into the union as a separate state: till then it belonged to North Carolina. Its principal rivers are the Cumberland and the Tennessee, both which fall into the Ohio at the distance of ten miles from each other, and are separated for nearly the whole of their course by the Cumberland mountains, which are a process from the Alleghanies. Cumberland river rises in Kentucky, among the mountains which separate it from Virginia. It has a course of about four hundred and fifty miles, and is navigable in winter and spring as far as three hundred and fifty miles from its afflux; but in summer it cannot be ascended more than two hundred and thirty, i. e. fifty above Nashville. The Tennessee is the largest river that falls into the Ohio. It commences at a place called West Point, on the south-east side of the Cumberland mountains, and is formed by the junction of the Clinch and Holston, both which rise in the Alleghany mountains: they are each near two hundred yards wide at their confluence, and are navigable to a great distance. The Holston, in particular, is so for nearly two hundred miles; so that the Tennessee, in conjunction with it, would have a navigable course of about eight hundred miles, if it were not for the muscle shoals which, for six months in the year, obstruct the passage about two hundred and fifty miles from its mouth. The greater part of the Tennessee, running through the Indian territory, has scarcely any settlements on its banks.

The Cumberland mountains divide the state of Tennessee into two parts, which have so little connection with each other, and differ so much in their products and interests, that they will probably soon become separate states. They were originally known by the names of Cumberland and Holston. West Tennessee, or Cumberland, is in extent about two-thirds of the whole, and though it had few settlers before 1789, is now supposed to contain about thirty thousand white inhabitants. Nashville, its principal and oldest town, consists of about one hundred and twenty houses, of which seven or eight are built of brick. The vegetable earth rests chiefly on a horizontal calcareous rock, but is not so deep as in Kentucky, and partakes more of an argillaceous nature, without any mixture of stony substances. On the high

banks of some of the rivers the upper rocks cover thick beds of ferruginous schistus lying horizontally, the laminae of which, on the slightest touch, break off in pieces a foot long, and fall spontaneously to powder; and on such as are the least exposed to the water and the light, there is a white efflorescence of an extreme tenuity, and greatly resembling snow. In these banks there are also deep caverns, in which are found masses of an aluminous substance, so near the degree of purity required for the operations of dying, that the inhabitants not only collect it for their own use, but also send it to Kentucky.

As greater care has been taken to render the titles to property clear and uncontroversible, this part of Tennessee is now generally preferred to Kentucky. The superior warmth of the climate, moreover, is favourable to the growth of cotton, a much more profitable produce than either grain, hemp or tobacco; stuffs of a fine quality are already fabricated in the country from the raw material.

East Tennessee or Holston is situated between the Cumberland mountains and the highest part of the Alleghanies. Its limestone appears to be deeper than in West Tennessee, and the beds which incline to the horizon, are divided at small intervals by strata of quartz; it is watered also by a great number of small rivers, which cross it in all directions. The best land is on their banks; the remainder is of an indifferent quality; and as the climate is considerably colder than that of West Tennessee, none of it is favourable to the cultivation of cotton. Dr. Michaux, satisfied with stating the fact, has assigned no reason for the latter difference; but it may probably be owing to the opposition made by the Cumberland mountains to the passage of the warm current of air from the gulph of Mexico, to which Volney has ingeniously attributed the superior temperature of the countries on the Mississippi to that of places on the same parallel of latitude in the Atlantic states.

East Tennessee began to be settled as early as 1775, and the number of its inhabitants is now estimated at about seventy thousand, including three or four thousand negroe slaves. On account of the bad navigation of the river, its trading concerns are nearly all carried on by land with the sea ports on the Atlantic; it is, therefore, thought by Dr. Michaux to be the most unfavourably situated of all the parts of the United States that are now inhabited, being surrounded by extensive tracts of

country which yield the same products, and are either more fertile or nearer the sea-side. The seat of government for the whole state is at Knoxville, on the Holston, which contains about two hundred houses.

The mountains on the east of Tennessee are generally allowed, by the emigrants from Pennsylvania and Virginia, to be higher than any others to the south of Hudson's river. They place the great father mountain in the first rank, then the iron mountain, the yellow mountain, the black mountain, and the table mountain. In support of this opinion it is alleged, that between the 10th and 20th of September, the cold becomes so severe on the mountains, that the inhabitants are obliged to have fires, which is not the case with any of those in Virginia, although they are some degrees farther north. Dr. Michaux has also seen in his father's notes that he found trees and shrubs on the yellow and great father mountains which he never met with afterwards, except in Lower Canada. These mountains do not form part of the grand chain, but are strictly within the district of the western waters. They have also a peculiar character, and instead of forming a regular ridge with little or no undulation, they are insulated mountains contiguous only at the base. The real dividing ridge, which is truly a continuance of what are called the Alleghanies in Pennsylvania, is known in North Carolina by the name of the blue ridge. It is much lower than

the Tennessee mountains, and was passed by Dr. Michaux to the east of the iron mountain on his return to Charlestown.

In the whole of the western states thirty years ago, there were scarcely three thousand inhabitants: at present there are more than four hundred thousand. There are two printing presses, both at Pittsburgh and Lexington, each of which publishes two newspapers every week. At Knoxville one is published twice a week, and at Chillicotte, Nashville, and at Jonesborough and Holston once. And so desirous is the federal government to propagate instruction and a knowledge of the laws among the people, that it allows the editors of the periodical papers, published through the whole extent of the United States, to receive those which they exchange with each other, or which are directed to them, post free.

We have endeavoured to condense and to digest into as small a compass as possible, what appeared most important with respect to the rising states, that it may serve as a kind of fixed point from which their farther progress may be estimated. An abundant and rich gleanings, we are very sensible, may be gathered after us: but for this, as well as for our author's observations on his way through North and South Carolina to Charlestown, we must refer our reader to the work itself: and shall only add, that the narrative is illustrated by a distinct map of the southern, western, and middle states.

ART. XVII. *Familiar Letters from Italy to a Friend in England.* By PETER BECKFORD, Esq. In Two Volumes, 8vo. pp. 904.

IT is not very easy to throw the charm of novelty over a tale which has been so often told. These letters were, many of them, written so long ago as the year 1787, and most of them before the invasion of Italy by the French. Mr. Beckford seems to have passed much of his time on the continent, and to have had abundant leisure to complete his memoranda. We cannot, however, think that the present work was much wanted: it contains a great deal of unnecessary matter; matter which presumes much upon the ignorance of the reader. What in the name of good taste or common sense should an epitome of the ancient History of Rome be intro-

duced for? Almost every town he enters Mr. Beckford thinks demands from him a sketch of its classic days! The familiarity of the style displeases us: Mr. Beckford introduces too many silly stories and jokes from Joe Miller, many of them are coarse and vulgar, and some of them scarcely decent. If on the one hand, however, we complain that these letters contain much irrelevant and tiresome matter, it must, on the other hand, be conceded, that every thing is described which admits of description: now and then a leisure hour may be employed, not unprofitably, in perusing them.

ART. XVIII. *Naufragia; or Historical Memoirs of Shipwrecks, and of the Providential Deliverance of Vessels.* By JAMES STANIER CLARKE, F. R. S. Chaplain of the Prince's Household, and Librarian to his Royal Highness. 12mo. pp. 421.

WE are sorry that so useful a design as that of this volume should have been

executed by Mr. Stanier Clarke. Any thing like a judicious selection we could not expect from this gentleman, after his *History of Maritime Discovery*; but we did expect that he would have shown more knowledge of the subject upon which he was writing. Not one of the most extraordinary shipwrecks which have taken place are to be found in his collection: but the novels of Robert A-Machin, and Captain Richard Falconer, are unsuspiciously inserted as true history; Philip Quarle is just as credible, and just as authentic as either.

Here we might dismiss this meagre compilation, were there not in the first section a 'Dissertation' on the real author of *Robinson Crusoe*, which requires some comment. The following extract is the whole of this dissertation:

"Before I conclude this section, I wish to make the admirers of this Nautical Romance mindful of a report, which prevailed many years ago; that *Defoe*, after all, was not the real author of *Robinson Crusoe*. This assertion is noticed in an article in the seventh volume of the *Edinburgh Magazine*. Dr. *Towers* in his *Life of Defoe* in the *Biographia*, is inclined to pay no attention to it: but was that writer aware of the following letter, which also appeared in the *Gentleman's Magazine** for 1788? at least no notice is taken of it in his *Life of Defoe*.

"MR. URBAN, *Dublin, Feb. 25.*

In the course of a late conversation with a nobleman of the first consequence and information in this kingdom, he assured me, that Mr. *Benjamin Holloway*, of Middleton Stony, assured him, some time ago, that he knew for fact, that the celebrated romance of *Robinson Crusoe* was really written by the *Earl of Oxford*, when confined in the tower of London; that his lordship gave the manuscript to *Daniel Defoe*, who frequently visited him during his confinement: and that *Defoe*, having afterwards added the second volume, published the whole as his own production.—This anecdote I would not venture to send to your valuable magazine, if I did not think my information good, and imagine it might be acceptable to your numerous readers; notwithstanding the work has heretofore been generally attributed to the latter."

W. W.

"It is impossible for me to enter on a discussion of this literary subject; though I thought the circumstance ought to be more generally known. And yet I must observe, that I always discerned a very striking falling off between the composition of the first and second volumes of this Romance—they seem to bear evident marks of having been the work of different writers."

Mr. W. W. dating from Dublin, informs Mr. Urban of the *Gentleman's Magazine*, that an Irish nobleman assured him that he was assured by Mr. Benjamin Holloway, of Middleton Stony, that he, the said Mr. Benjamin Holloway knew, for fact, that the earl of Oxford wrote the first volume of *Robinson Crusoe*! Admirable evidence! Mr. W. W. one; the Irish nobleman two; Mr. Benjamin Holloway three—here there is a gap, and we know not through how many generations this ridiculous falsehood had passed before it reached Middleton Stony. And Mr. Clarke, though it is impossible for him to enter into the subject, thought this testimony ought to be more generally known, and adds, in support of it, that he always thought the second volume of *Robinson Crusoe* inferior to the first. Admirable critic!

Nothing can more strongly characterize a mean and little mind than an eagerness to believe and propagate such idle calumnies as this! What would a court of justice say to Mr. Stanier Clarke if he were to make his appearance before them with a story that Mr. A. B. had written him an anonymous letter, to say that a worthy friend of his had assured him that John-a-Nokes knew for fact that John-a-Stiles had picked his pocket! False accusation in the present case is as much heavier an offence as the value of a good name is greater than gold. Mr. Clarke's memory may help him to this comparison in verse.

Something is said of Alexander Selkirk in this same section. The reader who would wish to know every thing that can be known concerning him, may consult a little volume upon the subject, published four or five years ago, by Mr. Isaac James of Bristol. The account is authentic, and highly curious.

ART. XIX. *A Northern Summer; or Travels Round the Baltic; through Denmark, Sweden, Russia, Prussia, and part of Germany, in the Year 1804. By JOHN CARR, ESQ. Author of the Stranger in France, &c. &c.* 4to. pp. 480.

MR. CARR gave a light and agreeable account of his excursion into France, and he has now given us a light and agreeable account of his travel through the less fre-

quented countries which surround the Baltic. To afford amusement seems to have been a prime object with the author; he writes, *currente calamo*, and enters but slightly into the politics, religion, history, or statistics of the countries he visited. Mr. Carr is an *artist*, and the delineation of national characteristics is congenial with his taste and pursuits: his anecdotes are numerous and oftentimes illustrative.

The first capital town worth stopping at is Copenhagen: *en passant*, we have a good picture at Husum. The fair was held at the time Mr. Carr was there; the buckrammed bosoms of the women, together with the vast protuberant rotundities which they display behind, form a whimsical contrast to the fashionable dress of our English beauties. 'In the evening, a crazy violin and drum allured me into a public room, in which the merry peasants were dancing waltzes. Heavens! what movements! A Frenchman who resolves every thing into operatic effect, would have felt each particular hair stand erect had he contemplated the heavy solemnity of the performers. The females looked like so many tubs turning round, and their gallant partners never moved their pipes from their mouths.' This is not a bad picture; a Danish Jupiter making love to some tender female, fire issuing from his mouth, and the god himself, 'invisible, or dimly seen,' through clouds of smoke that curl around him. Bunbury might give it to our print shops.

Dancing is a favourite diversion with our northern as well as our southern neighbours: if the poorer classes of this country meet together it is to drink! A memorable day for Denmark was the 2d of April, 1801: we claim the honours of that hard-earned, if not dubious victory, and certainly in its consequences we had every reason for triumph; the battle off Copenhagen dissolved the confederacy of the northern powers, and produced the convention, in 1803, between his Britannic Majesty, and the king of Sweden, respecting the search of neutral vessels, and regulating what should in future be deemed legitimate cargoes. The Danes, however, fought so valorously, and with such terrible effect, that for two years they commemorated *their* victory by an anniversary rejoicing.

"On our return to the city, and about a mile from it, a turf'd hillock of small poplars attracted our notice: it was the national tomb of the heroes who fell in the memorable battle of Copenhagen roads, on the 2d of April,

1801, and stood in a meadow about two hundred yards from the road, and looked towards the crown battery. As we approached it we saw a small monumental obelisk which was raised to the memory of captain Albert Thurah, by the Crown Prince. It appeared by the inscription, that during the heat of that sanguinary battle, a signal was made from one of the block ships, that all the officers on board were killed; the Crown Prince, who behaved with distinguished judgment and composure during the whole of that terrific and anxious day, and was giving his orders on shore, exclaimed, 'who will take the command?' The gallant Thurah replied, 'I will, my Prince,' and immediately leaped into a boat, and as he was mounting the deck of the block ship, a British shot numbered him amongst the dead, which formed a ghastly pile before him, and consigned his spirit and his glory to the regions of immortality."

A larger tomb is erected by their grateful country over her fallen heroes:

"It is a pyramidal hillock, neatly turf'd and planted with sapling poplars, corresponding with the number of officers who fell. At the base of the principal front are tomb stones recording the names of each of these officers, and their respective ships. A little above is an obelisk of grey northern marble, raised upon a pedestal of granite bearing this inscription:

"To the memory of those who fell for their country, their grateful fellow citizens raise this monument, April 2, 1801.

"And beneath, on a white marble tablet, under a wreath of laurel oak, and cypress bound together, is inscribed:

"The wreath which the country bestows never withers over the grave of the fallen warrior.

"The whole is enclosed in a square palisado: as a national monument, it is too diminutive."

The following anecdote is worthy to be recorded: after the preliminaries of pacification were adjusted, at the impressive interview between lord Nelson and the Crown Prince, the latter took some refreshment at the palace:

"During the repast Lord Nelson spoke in raptures of the bravery of the Danes, and particularly requested the prince to introduce him to a very young officer, whom he described as having performed wonders during the battle, by attacking his own ship immediately under her lower guns. It proved to be the gallant young Welinos, a stripling of seventeen; the British hero embraced him with the enthusiasm of a brother, and delicately intimated to the prince that he ought to make him an admiral, to which the prince very happily replied, 'If, my lord, I were to make all my brave officers admirals, I should have no captains or lieutenants in my service.' This he-

roic youth had volunteered the command of a praam, which is a sort of raft, carrying six small cannon, and manned with twenty-four men, who pushed off from shore, and in the fury of the battle placed themselves under the stern of lord Nelson's ship, which they most successfully attacked, in such a manner that, although they were below the reach of his stern chasers, the British marines made terrible slaughter amongst them: twenty of these gallant men fell by their bullets, but their young commander continued knee-deep in dead at his post, until the truce was announced. He has been honoured, as he most eminently deserved to be, with the grateful remembrance of his country and of his prince, who, as a mark of his regard, presented him with a medallion commemorative of his gallantry, and has appointed him to the command of his yacht, in which he makes his annual visit to Holstein."

Copenhagen does not present many objects of high interest and curiosity: the city is between four and five English miles in circumference, containing about four thousand houses: the royal palace fell a victim to the flames in the year 1794; it was an immense and splendid pile of building. Its internal decorations were of the highest magnificence: the rittsaal, or knight's saloon, was one hundred and eighteen feet long, and fifty-eight feet broad: nine windows lighted it by day, and at night twelve hundred wax-lights, distributed in three lustres, shed a brilliant blaze over the room; on each side was a gallery richly gilded, and supported by forty-four columns of cinnamon wood, the base and capitals of which were also richly gilded. The paintings of Abilgaard on subjects of Danish history embellished the hall: the library of the king contained one hundred and thirty thousand volumes, and three thousand manuscripts, and was much injured by the fire. Part of the castle of Charlottenburg is devoted to the royal academy of painting, architecture, and sculpture. Those of its productions which Mr. Carr had an opportunity of seeing, gave him no very high opinion of the fine arts in Denmark. The palace of Fredericksberg, where the king resides, is small, and the gardens are tastefully arranged; his majesty has for many years been unable, from the infirmity of his mind, to perform the royal functions, which devolve on the crown prince, who is deservedly beloved by all his subjects. The Danes are a grateful people: a few miles from the capital on one side of the public road is a plain and simple monument, erected by the peasants of the late count Bernstorff, in gratitude of their liberation.

The crown battery is an interesting object: it is square, stands about half an English mile from the shore, the water flowing into it. It is undergoing alteration and enlargement; government has it also in contemplation to raise a fresh battery to the southward.

Among the charitable institutions is an hospital where pregnant women, who have reason for seeking concealment, are received upon paying a small stipend: they enter at night in masks, and are never seen but by those who are necessary to their comfort, nor are their names ever required. This interesting asylum seems far preferable to foundling hospitals, which offer a premium to the violation of maternal feelings: it is said to have produced a visible diminution in the crime of infanticide. The mild laws of Denmark punish not even the murderer with death.

Taking leave of Denmark, we cross the Sound, and enter into the Swedish territories: the sight of Cronenberg castle recalls to mind the unhappy fate of the amiable Matilda, who fell a sacrifice to the political jealousy of Juliana Maria, the monster step-mother of his present majesty. The story of her misfortunes excited so deep an interest at the time that Mr. Carr has introduced it. Cronenberg castle now forms the residence of the governor of Elsinour: it mounts three hundred and sixty-five pieces of cannon, and its subterranean apartments will hold more than a regiment of men. Its strength, however, is not so formidable as its appearance: the British fleet under admirals Parker and Nelson passed it with perfect impunity, and disdained to return a shot: it stands on a peninsular spot, the nearest to Sweden.

The next place we stop at is Stockholm, but in travelling from capital to capital we must not forget the intermediate country: the appearance of the peasantry and of their cottages, indicates poverty:

"Sweden is one continued rock of granite, covered with fir: hence the cottages, which are only one story high, and many of the superior houses, are constructed of wood, the planks of which are let into each other in a layer of moss, and the outside is painted of a red colour; the roof is formed with the bark of the birch, and covered with turf, which generally presents a bed of grass sufficiently high for the scythe of the mower. The floors of the rooms are strewn with the slips of young fir, which give them the appearance of litter and disorder, and the smell is far from being pleasant. Nothing can be more dreary than winding through the forests, which every now

and then present to the weary eye little patches of cleared ground, where firs had been felled by fire, the stumps of which, to a considerable height, were left in the ground, and, at a distance, resembled so many large stones. Inexhaustible abundance of wood induces the peasant to think it labour lost to root them up, and they remain to augment the general bareness of the scenery.

"The population in both the provinces of Scania and Smaland is very thinly diffused: except in the very few towns between Flensburg and Stockholm, the abode of man but rarely refreshes the eye of the weary traveller. At dawn of day, and all day long, he moves in a forest, and at night he sleeps in one. The only birds we saw were woodpeckers. The peasantry are poorly housed and clad; yet, amidst such discouraging appearances, their cheek boasts the bloom of health and the smile of content. Their clothes and stockings are generally of light cloth; their hats raised in the crown, pointed at top, with large broad brims, and round their waist they frequently wear a leathern girdle, to which are fastened two knives in a leather case. The country in these provinces appeared to be very sterile; only small portions of its rocky surface were covered with a sprinkling of vegetable mould."

The peasants bake their bread only once, or, at most, twice in the year: in times of scarcity they add the bark of the birch well pounded; and Mr. Carr says, that thus prepared, their cakes require the jaws of a stone-eater to penetrate them. They are made round and flat, with a hole in the middle, through which a stick or string is passed, and they are suspended from the ceilings,

Stockholm is under infinite obligations to the taste and genius of the late illustrious monarch Gustavus III. who not merely gave encouragement to science and the fine arts in his metropolis, but to commerce and agriculture throughout his kingdom. The manner, however, in which he effected the revolution of 1772, and the absolute power with which he invested himself at the expence of the aristocracy, are not consistent with the character to which he aspired, namely, that of a patriot king. The power which Gustavus gained he employed for the benefit of his people; this cannot be questioned; but to effect a revolution by his sole intrigues, and in that revolution to destroy the legitimate, though abused power, of the states, and make himself a despot, was an act of violent hostility against the principles of liberty. Mr. Carr is dazzled by the splendour of his genius and the exhaustless resources of his mind; he is lost in astonishment and admiration.

In a temporary building at the house of

Sergell the statuary, Mr. Carr saw the colossal pedestrian statue of this monarch, in bronze, which had just been cast, and was then polishing. It is a present from the citizens of Stockholm, and will cost forty thousand pounds; it is, perhaps, the last effort of the art of Sergell, who, although every tribute of honour has been paid to the sublimity of his genius, and the delicacy of his taste, is now become insensible to admiration, disgusted with himself, and disgusted with the world. His Cupid and Psyche is not to be sold till after his death.

The palace at Stockholm is an elegant edifice, begun by Charles XI. and finished by Gustavus III.; within its walls is the king's museum, which Mr. Carr was fortunate enough to see, immediately after the opening of several packages containing five hundred valuable paintings and antique statues from Italy, where they had been purchased by the latter sovereign about eleven years since, and had been prevented from reaching their destination by the French revolution. They lay in great confusion, and some of them were much damaged. In the palace of Drottingholm there are also some exquisite statues in alabaster and marble, and Etrurian vases, purchased in Italy by Gustavus III. Haga was the favourite retreat of this illustrious monarch: the little palace, or rather chateau, which is of wood, and is extremely elegant, was built after his designs, with the assistance of Masrelie. The gardens are laid out with great taste, and the surrounding scenery is remarkably picturesque. Haga is about a mile and a half from Stockholm: in the year 1791 Gustavus laid there the foundation of a vast palace, but the undertaking was discontinued at his death, as being on too large a scale, and too expensive for the country.

The laws of Sweden are mild and simple; capital punishments are seldom inflicted, and the prosecutor sustains no share of the expence of prosecuting a criminal. England would do well to adopt this system of indemnification, as Sweden would to imitate from her the adjustment of costs in civil causes by reference to a jury. In Sweden each party pays his own costs.

Mr. Carr made an excursion to Upsala, and paid a visit to the mines of Danmora, which, notwithstanding they have been wrought for three hundred years, yet produce a vast quantity of ore of a superior quality, much used in the British steel.

manufactories. The ancient town of Upsala was once the capital of Sweden, and the residence of the high-priest of Odin: in the cathedral, which is a prodigious and unwieldy pile of brick and of heterogeneous architecture, repose the ashes of Linnæus. The following simple epitaph points out the spot:

" OSSA
CAROLI A LINNÆ
equitis aurati
marito optimo
filio unico
CAROLO A LINNÆ
patris successori
et
sibi

SARA ELIZBETHA MORÆA.

"The affectionate reverence of the pupils of this distinguished expounder of nature, and the powers of his celebrated friend Sergell, have endeavoured to supply the humility of the preceding tribute, by raising, in a little recess, a monument of Swedish porphyry, supporting a large medallion of the head of the illustrious naturalist, which is said to be an admirable likeness of him; under it is the following inscription:

CAROLO A LINNÆ
Botanicorum
principi
Amici et discipuli,
1798."

In a private chapel of the cathedral is the tomb of Gustavus Vasa, whose effigy is placed between that of his two wives, Catherine and Margaret. Mr. Carr should have transcribed the inscription which is sacred to the memory of such a hero, such a patriot, and such a man.

From the Swedish Mr. Carr proceeds to the Russian territories: his talents for description are pleasingly displayed in the following passage:

"At five o'clock in the evening of the sixth of July, with very little wind, we slowly withdrew from Stockholm. Before night we were completely becalmed; our captain rowed us up to a rock, and throwing out a gang-board, tied the vessel to a fir-tree for the night. Here we landed, and ascended the rocks, which, sparingly clothed with grey moss, rose from the water's edge in the most grand, romantic, and picturesque disorder. Before us the rich crimson suffusion of the sun, just sunk behind a dark undulating line of fir forests, gave at once tranquillity and tone to the lake appearance of this arm of the Baltic, which was enlivened by the white-lagging sails of a few boats, that on the opposite side softly and slowly crept through the deep shadows of the shores, crowned with the woods of Liston-

cottage; whilst in the south, the tower of St Catherine's, mounted upon her airy summit the houses, the palace, and the spires, seemed composed of light cloud and mist. The silence of this delicious repose of nature was only faintly broken by the dashing of the oar and the carol of the distant boatmen; in the language of the divine Milton:

'Now came still evening on, and twilight gray

Had in her sober livery all things clad:
Silence accompanied; for beast and bird,
They to their grassy couch, these to their
nests,
Were slunk——

—— now glowed the firmament
With living saphirs.'

"Seated upon a rock, we for a long time contemplated this exquisite scene, till at length the call of sleep induced us to descend into our cabin, where our accommodations were very comfortable. With the sun, which was an early riser, we unmoored, and advanced, but very slowly; as we proceeded, misery in a new shape presented itself. From a wretched hovel, upon one of the islands which began to appear in clusters, hanging over the edge of the water, and ready to drop into it, an old man in rags, and nearly blind, put off in a little crazy boat, and rowing towards us implored our charity in the most touching manner, and seemed very grateful for the trifle we gave him.

"In the evening, having made but little way, the master again moored the vessel to another island for the night: as I found was the custom, on account of the danger and difficulty of the navigation. This island was indeed a most enchanting scene; upon its romantic summit of grey rock we found a little cottage, embowered in trees of fir, ash, and elder, that might well be called 'the peasant's nest.' A fisherman, his aged mother his wife and his children, formed the population of this beautiful spot. A little field of grass, in which a cow was grazing, another of corn, a garden, and the waters of the Baltic, which again resembled a lake, supplied them with all their wants, and all their riches. Here it seemed as if the heart could no longer ache, as if ambition might wish to be what he beheld, and that love might ponder on the past without a pang. The inside of the cottage was neat and cheerful; the good old lady, with the children in their shirts playing round her, sat knitting by the light of a sprightly fire, and under locks of snow presented a face at peace with all the world. Upon hearing that we wished to have some supper, the fisherman, with a countenance of health and gaiety, descended into a little creek, where his boats were moored, for some perch, confined in a wicker well in the water, whilst his young wife, who had a pair of very sweet expressive eyes, laid the cloth in a detached room facing the cottage. Whilst supper was preparing I rambled over this little paradise. Night came

and all the beauties of the proceeding evening, with some variety of new forms, returned; the same bright bespangled heaven! the same serenity; the same silence! yielding only to the unceasing rippling of a little stream of rock water, to which, as it gushed from a bed of long moss, and as our fair hostess presented her pitcher, thriftily fenced with wicker, might be applied the beautiful inscription of Bosquillon, on the fountain in the street of Notre Dame des Victoires in Paris:

"La nymphe qui donne de cette eau
Au plus creux du rocher se cache:
Suivez un exemple si beau;
Donnez sans vouloir qu'on le sache."

Or thus in English:

"Prompt to relieve, tho' *victless* wrapp'd
in stone,
The nymph of waters pours her generous
stream:
Go, gentle reader, do as she has done;
See while you bless, but *blessing be unseen*."
J. C.

"It was just such a spot as the poetical spirit of Cowper would have coveted: his eye would have penetrated, and his pen could alone have painted every beauty."

Bad as the inns are in Sweden, they are still worse in Russia—poor as the peasants are in Sweden, still poorer is the peasantry in Russia. Swedish and Russian Finland are the confines of the two countries, and rival each other in sterility, gloom, and wretchedness.

The capital of the Russian empire has been described by so many travellers of various tastes, countries, and pursuits, that we have hardly a right to expect much novelty from a transient visit. Mr. Storch's 'Picture of Petersburg' is spread upon such an ample canvass, and executed with so accurate a pencil, as to have left comparatively little for succeeding artists. On the other hand, the imperial city, from the unbounded power and resources of the monarch, is ever presenting some new object of admiration to the observer: in the course of the last year five hundred noble houses were erected within its walls! Its population has nevertheless declined, whilst, as appears from the last estimate, that of the country has increased.

A metropolis is the centre from which civilization radiates, shedding on the remoter provinces its weakened beams, fainter and more faint, as the line of distance lengthens. To the genius of Peter the Great and the late Catherine, Russia is indebted for every thing: for the creation and extent of her commerce, and for her elevation to that rank and power which

she now holds among the nations of the earth: they taught the barren wilderness to smile, and formed the statue from the unhewn rock. The present emperor is treading in the steps of his illustrious ancestors, and there is hope that, in a long reign, he may succeed in rubbing off many of the asperities which still characterize his subjects. The arts are highly encouraged and cultivated in Petersburg; architecture with more success than statuary: statuary with more success than painting, which seems to demand a milder climate. The great obstacle to civilization is the ignominious and grinding vassalage of the peasantry: the late Catherine made some attempts to mitigate its severity, and Alexander will better deserve the appellation of GREAT than his Macedonian namesake, if he subdues that pride and prejudice of his nobility which are nourished to the injury of his people.

A Russian peasant is in a state of the lowest degradation:

"What of good he has he owes to himself; his foibles, and they are few, originate elsewhere: he is the absolute slave of his lord, and ranks with the sod of his domains; of a lord whose despotism is frequently more biting than the Siberian blast. Never illumined by education, bruised with ignoble blows, the object and frequently the victim of baronial rapacity, with a wide world before him, this oppressed child of nature is denied the common right of raising his shed where his condition may be ameliorated, *permitted* only to toil in a distant district under the protection of that disgraceful badge of vassalage, a *certificate of leave*, and upon his return compellable to lay the scanty fruits of his labour at the feet of his master; and finally, he is excluded from the common privilege which nature has bestowed upon the birds of the air, and the beasts of the wilderness, of chusing his mate; he must marry when and whom his master orders. Yet under all this pressure, enough to destroy the marvellous elasticity of a Frenchman's mind, the Russian is what I have depicted him. If the reader is not pleased with the portrait, the painter is in fault."

It is a vulgar apophthegm, 'take care of the pence, and the pounds will take care of themselves': it may be applied in politics, 'take care of the poor, the rich will take of themselves.' The Russians, according to Mr. Carr, are not bad materials to work upon: he over-rates them however. To 'bear the curse and scorn, and frequently the blows of his superior with mildness,' proves only that his spirit is broken, and his manhood mutilated; the individual Russian, perhaps this 'poor

slave of the north,' may have displayed 'the most heroic valour in the field, and the most gentle moderation in success;' but the victories of Suwarrow were the indiscriminate desolations of a beast of prey: the relentless massacre of thirty thousand Turks at Ismael, and almost of an equal number of Poles at Praga and Warsaw, displayed more of ferocity than 'heroic valour,' and certainly evinced as little 'moderation in success' as a naturalist could have expected from any monsters in the shape of man.

It is an encouraging trait of character, that the Russian is mild and humane towards the animals over which he has dominion: if his horse is sluggish, he cheers him by a few exhilarating sounds. If the jaded beast proceeds no faster, still patient, he sings; if this does not answer the purpose, he talks to him, reasons with him, but is rarely seen to strike the animal, whose services are only withholden when the force of nature is exhausted.

"A Russian, in the ebullition of passion, may do a ferocious thing, but never an *ill-natured one*. No being under heaven surpasses him in the gaiety of the heart. His little national song cheers him wherever he goes. Where a German would snore for comfort, the Russian sings. There is nothing cold about him but his wintry climate; whenever he speaks, it is with good humour and vivacity, accompanied by the most animated gestures; and although I do not think that the Graces would at first pull caps about him, yet, in the dance, for spirit and agility, I would match and back him against any one of the most agile sons of carelessness in the *Champs Elysées*."

An Englishman feels the flush of honourable and patriotic pride, that whithersoever his countrymen go, they are received with cordiality and respect; in their person a willing homage is paid to the intellectual and moral character of the British nation. Whoever has travelled on the continent knows this: Mr. Carr relates many little anecdotes indicative of the deference paid to Englishmen in Russia. Many are settled at Petersburg, which owes some of its architectural ornaments to their genius and taste: particularly to Mr. Cameron, the present imperial architect, who has a superb suite of apartments in the Michaelisky palace.

* It is to be regretted that any considerations of delicacy or prudence should exist, sufficiently well-grounded to prohibit the disclosure of every particular which is known on so interesting an event. The time may arrive when Mr. Carr will deem these restraints no longer necessary; in which case he will no doubt supply us with that important desideratum, the name of the person who *beheld the catastrophe*, and from whom his information is derived.

Mr. Gould yet holds the office of imperial gardener at the Taurida palace; he enjoys a munificent salary, and beholds this 'little paradise, which he created from a mephitic bog, flourishing and exciting the admiration of foreigners, and in the shade of which Potemkin, Catherine the Great, and two succeeding emperors of Russia, have sought tranquillity and repose from the oppressive weight of public duty.' The Russian navy is supplied with several English officers: the late emperor offered the command of a vessel to the noted pirate Paul Jones; on hearing it, all the Englishmen in his service instantly sent in their resignations. This anecdote must be recorded to their honour.

The Taurida palace was built by Catherine II., and presented to her favourite, prince Potemkin: here it was that he gave to his imperial mistress that costly fête which beggars all description, and even baffles imagination to conceive of. In the gorgeous magnificence of their palaces, and the splendor of their entertainments, the Russians far surpass the feeble pomp of more southern princes: to the banks of the Neva seem to have been transferred all the riches, grandeur, and luxury of Asia. Mr. Carr was an eye-witness of the brilliant festivities which took place at the nuptials of the grand duchess of Russia and the prince of Saxa Weimar.

Within the massy walls of Michaelisky palace perished the unhappy Paul: Mr. Carr has devoted a chapter to this gloomy subject, and thrown an interest over the fate of the emporor, which the violence and eccentricities of his character and conduct had almost forbidden to be excited in his favour. 'The original source of my information,' says he, 'is from one who *beheld the catastrophe* which I am about to relate, whom I can neither name nor doubt; a catastrophe which is too near the period in which I write not to render an unrestrained disclosure of all the particulars with which I have been furnished unfair, if not imprudent.'

The causes which first produced the unnatural estrangement of Paul from his mother are unknown: it is not unknown, however, that, for many years past, he was kept in a state of the most mortifying and

humiliating degradation. He was not only deprived of the honours due to his high rank, but even cut off from the ordinary felicities of life: 'the pressure of his hand excited suspicion; peril was in his attachment, and in his confidence guilt and treason. He could not have a friend without furnishing a victim.'

Paul is said, by a gentleman who had the honour of spending a short time at his secluded little court of Gatschina, to have displayed 'a mind very elegantly inclined, and, without being brilliant, highly cultivated, accomplished, and informed, frank and generous, brave and magnanimous, a heart tender and affectionate, and a disposition very sweet, though most acutely and poignantly susceptible: his person was not handsome, but his eye was penetrating, and his manners such as denoted the finished gentleman.' He loved, even to indulgence, his family and servants, who, in return, were most devotedly attached to him. His ardour in military pursuits was enthusiastic: his celebrated challenge to the crowned heads of Europe was worthy the age of chivalry.

It was the intention of Catherine that Paul should be passed over in the succession, and that the grand duke Alexander should mount the vacant throne on her demise. A short time before this event, she had committed to count P— Z— a declaration of her will to this effect, addressed to the senate. This last favourite of Catherine's, however, immediately on learning the death of his royal mistress, flew to Pavlovsk, where Paul then resided, and delivered up to him this important document. The new emperor rewarded the courtier's well-timed zeal, by allowing him alone, of all the panders to his mother's loose and voluptuous excesses, to retain his honours and his fortunes.

Paul, however, soon repented of his liberality: every spot which had been polluted with Catherine's licentious orgies became hateful in his eyes, and every person who had been associated in them was to the last degree disgusting. Paul had been elevated to the imperial dignity but a very short time before he gave alarming symptoms of occasional derangement: so

utter was his abhorrence against those palaces which had been the favourite residences of his mother, that, in his delirium, he had determined to level every one of them to the ground, and actually built for himself that gloomy and enormous pile, the palace of Michaelisky, which was the scene of his own murder.* With these strong feelings, it was impossible that the sight of count P— Z— should not have been odious to him: to effect his ruin, he was denounced as a defaulter to the imperial treasury of half a million of rubles, and Paul proceeded to sequester his estates, and those of his two brothers. In despair, one of the latter walked boldly up to the emperor on parade, and represented to him the injustice of his measures: it marks the inconsistency of Paul's character that he listened to him with attention, and restored the property. The original disgust soon returned, and P— Z— was ordered to reside on his estate: this rustication was borne with impatience; and madame Chevalier—a French actress of resistless fascination, who had been purposely introduced on the boards of the French theatre at Petersburg, by Messrs. Otto, Sieyes, and Talleyrand, to seduce the emperor, and decoy him into a political snare—madame Chevalier was bribed, by a magnificent aigrette of diamonds, valued at sixty thousand rubles, to intercede, in some unguarded hour of dalliance, for the restoration of the count. The artifice succeeded, and the count was graciously received by his imperial master, against whom, whatever private pique the former might have cherished, Mr. Carr believes it was wholly lost in his review of the dreadful condition of the empire, and in those awful measures which were afterwards resorted to. However that may be, it seems to have been in the bosom of P— Z— that originated the idea of saving the empire by destroying the sovereign. Several noblemen, and persons of high rank and consequence, among them was the governor of the city, engaged in this fearful business; and, according to the merciful and generous assurance of Mr. Carr, who one would suppose derived his information from the partial account of a conspirator,† none of them was actuated by any other motive

* During his temporary aversion against the English, Paul ordered the celebrated bust of Mr. Fox, which was modelled from life at the express desire of the late empress, to be carried into the cellar. The present emperor has done himself the honour to place it in the magnificent gardens of the Taurida palace, in company with a great number of beautiful statues and colossal casts.

† On the borders of Poland, Mr. Carr met this identical count P— Z— at a post-house;

than to prevent the final ruin of their country, and for this purpose they determined to place in peril their own lives and fortunes.

"The palace of St. Michael is an enormous fabric: the whole is moated round, and, when the stranger surveys its bastions of granite, and numerous draw-bridges, he is naturally led to conclude, that it was intended for the last asylum of a prince at war with his subjects. Those who have seen its massy walls, and the capaciousness and variety of its chambers, will easily admit that an act of violence might be committed in one room, and not be heard by those who occupy the adjoining one; and that a massacre might be perpetrated at one end, and not known at the other. Paul took possession of this palace as a place of strength, and beheld it with rapture, because his imperial mother had never even seen it. Whilst his family were here, by every act of tenderness endeavouring to soothe the terrible perturbation of his mind, there were not wanting those who exerted every stratagem to inflame and encrease it. These people were constantly insinuating, that every hand was armed against him. With this impression, which added fuel to his burning brain, he ordered a secret staircase to be constructed, which, leading from his own chamber, passed under a false stove in the anti-room, and led by a small door to the terrace.

"It was the custom of the emperor to sleep in an outer apartment next to the empress's, upon a sofa, in his regimentals and boots, whilst the grand duke and duchess, and the rest of the imperial family, were lodged at various distances, in apartments below the story which he occupied. On the tenth day of March, O. S. 1801, the day preceding the fatal night, whether Paul's apprehension, or anonymous information, suggested the idea, is not known; but conceiving that a storm was ready to burst upon him, he sent to count P—, the governor of the city, one of the noblemen who had resolved on his destruction: 'I am informed, P—,' said the emperor, 'that there is a conspiracy on foot against me; do you think it necessary to take any precaution?' The count, without betraying the least emotion, replied, 'Sire, do not suffer such apprehensions to haunt your mind; if there were any combinations forming against your majesty's person, I am sure I should be acquainted with it.' 'Then I am satisfied,' said the emperor, and the governor withdrew. Before Paul retired to rest, he unexpectedly expressed the most tender solicitude for the empress and his children, kissed them with all the warmth of farewell fondness, and remained with them longer than usual; and, after he had visited the centinels at their different posts, he retired to his cham-

ber, where he had not long remained, before, under some colourable pretext that satisfied the men, the guard was changed by the officers who had the command for the night, and were engaged in the confederacy. An hussar, whom the emperor had particularly honoured by his notice and attention, always at night slept at his bed-room door, in the anti-room. It was impossible to remove this faithful soldier by any fair means. At this momentous period, silence reigned throughout the palace, except where it was disturbed by the pacing of the centinels, or at a distance by the murmurs of the Neva, and only a few lights were to be seen distantly and irregularly gleaming through the windows of this dark colossal abode. In the dead of the night, Z— and his friends, amounting to eight or nine persons, passed the draw-bridge, easily ascended the stair-case which led to Paul's chamber, and met with no resistance till they reached the anti-room, when the faithful hussar, awakened by the noise, challenged them, and presented his fusée: much as they must have all admired the brave fidelity of the guard, neither time nor circumstances would admit of an act of generosity, which might have endangered the whole plan. Z— drew his sabre and cut the poor fellow down. Paul, awakened by the noise, sprung from his sofa: at this moment the whole party rushed into his room; the unhappy sovereign, anticipating their design, at first endeavoured to entrench himself in the chairs and tables, then recovering, he assumed a high tone, told them they were his prisoners, and called upon them to surrender. Finding that they fixed their eyes steadily and fiercely upon him, and continued advancing towards him, he implored them to spare his life, declared his consent instantly to relinquish the sceptre, and to accept of any terms which they would dictate. In his raving, he offered to make them princes, and to give them estates, and titles, and orders, without end. They now began to press upon him, when he made a convulsive effort to reach the window: in the attempt he failed, and indeed so high was it from the ground, that had he succeeded, the expedient would only have put a more instantaneous period to his misery. In the effort he very severely cut his hand with the glass; and, as they drew him back, he grasped a chair, with which he felled one of the assailants, and a desperate resistance took place. So great was the noise, that, notwithstanding the massy walls, and thick double folding-doors which divided the apartments, the empress was disturbed, and began to cry for help, when a voice whispered in her ear, and imperatively told her to remain quiet, otherwise, if she uttered another word, she should be put to instant death. Whilst the emperor was thus making a last struggle, the prince Y— struck him on one of his temples with his fist, and laid him upon

they seem to have passed the evening in company, and to have breakfasted together on the following morning, when the count gave the party a cordial invitation to his seat at Moscow.

the floor; Paul, recovering from the blow, again implored his life; at this moment the heart of P—Z— relented, and upon being observed to tremble and hesitate, a young Hanoverian resolutely exclaimed, 'We have passed the rubicon: if we spare his life, before the setting of to-morrow's sun, we shall be his victims!' upon which he took off his sash, turned it twice round the naked neck of the emperor; and giving one end to Z—, and holding the other himself, they pulled for a considerable time with all their force, until their miserable sovereign was no more: they then retired from the palace without the least molestation, and returned to their respective homes. What occurred after their departure can be better conceived than depicted: medical aid was resorted to, but in vain; and upon the breathless body of the emperor fell the tears of his widowed empress and children, and domestics; nor was genuine grief ever more forcibly or feelingly displayed than by him on whose brow this melancholy event had planted the crown. So passed away this night of horror, and thus perished a prince, to whom nature was *severely* bountiful. The acuteness and pungency of his feelings was incompatible with happiness: unnatural prejudice pressed upon the fibre, too finely spun, and snapped it.

"'Tis not as heads that never ache suppose,
 Forgery of fancy, and a dream of woes;
 Man is a harp, whose chords elude the sight,
 Each yielding harmony, disposed aright;
 The screws reverse'd (a task which, if he please,
 God in a moment executes with ease),
 Ten thousand thousand strings at once go
 loose,

Lost, till he tune them, all their power and
 use."

COWPER.

"The sun shone upon a new order of things. At seven o'clock the intelligence of the demise of Paul spread through the capital. The interval of time from its first communication to its diffusion over every part of Petersburg, was scarcely perceptible. At the parade Alexander presented himself on horseback, when the troops, with tears rolling down their rugged and sun-browned faces, hailed him with loud and cordial acclamations. The young emperor was overwhelmed, and, at the moment of mounting the throne of the most extensive empire under heaven, he was seen to turn from the grand and affecting spectacle, and weep.

"What followed is of a very subordinate consideration; but perhaps it will be eagerly asked, to what extremity did the avenging arm of justice pursue the perpetrators of the deed? Mercy, the brightest jewel of every crown, and a forlorn and melancholy convic-

tion, that the reigning motive was the salvation of the empire, prevented her from being vindictive. Never upon the theatre of life was there presented a scene of more affecting magnanimity; decency, not revenge, governed the sacrifice. P—Z— was ordered not to approach the imperial residence, and the governor of the city was transferred to Riga. As soon as madame Chevalier was informed of the demise of her imperial patron, she prepared, under the protection of her brother, a dancer, for flight, with a booty of nearly a million of rubles. A police officer was sent to inspect and report upon her property: amongst a pile of valuable articles, he discovered a diamond cross of no great intrinsic value, which had been given by Peter I. to a branch of the imperial family, and on that account much esteemed; it was to recover this that the officer was sent, who obtained it, after the most indecent and unprincipled resistance on her part. Passports were then granted to madame Chevalier and her brother. Thus terminated this extraordinary and impressive tragedy."

Numerous are the anecdotes of Alexander, which testify to the excellence of his understanding, and the benevolence of his heart; we had noted two or three of these, with a view of presenting them to our readers, but we are limited by the nature of our work. Mr. Carr took leave of Petersburg, passed through Livonia, and skirted the Baltic through the Prussian dominions till he reached Berlin. Here he halted a short time, and, of course, paid a visit to the great Frederick's favourite retreat at Potsdam: the picture gallery at *Sans Souci* is a noble room; and contains a very choice and precious collection. Military discipline seems to have relaxed nothing of its severity since the days of Frederick: on the other hand, it is pleasing to reflect that, throughout the Prussian dominions, and the vast empire of Russia, complete toleration in religious subjects is allowed.

After having rested himself from the fatigues of a long journey, Mr. Carr left the delightful Linden walk of Berlin, and that elegant specimen of architecture, the Brandenburg-gate, and returned to his native land. The account which he has given of his travels, displays a cultivated taste and an inquisitive mind. Several engravings adorn this volume from drawings, taken on the spot by the tasteful pencil of Mr. Carr.

ART. XX. *Sketch of his Majesty's Province of Upper Canada.* By D'ARCY BOULTON, Barrister at Law. 4to. pp. 99.

TO this volume is prefixed a map, but on so small a scale, and so scantily dotted

with towns, that not half the places or even subdivisions mentioned in the narra-

tive can therein be found; it is worse than useless, it is perplexing: we recommend, as an important improvement, attaching the narrative to a good map, and charging half-a-guinea for the volume. Where the extension of geographical knowledge is the chief object of a writer, he ought to provide the essential assistance of linear description.

The land-surveyors of Upper Canada, who have dissected its forests and marshes into rectangular shires, without setting up station-staves or rattling a polechain, are distributing, by the theodolite, such masses of property, as will outmeasure the estates of Russian nobles, and found rivals to British peers. With as little ceremony as one petitions for a clerkship in the excise-office, his majesty's patent is solicited for the grant of counties, which will place one's grandson among the lords of the world, and prepare new American wars from the ambitious ingratitude of over-fostered children. There is rashness in these grants. No quit-rents are reserved. No taxes levied. The expence of protection ought progressively to be asked of the dependent state; and the wisest form of obtaining the indemnity is not by the levies of the custom-house, but by the assessment of the tenantry. Let the rent to the state amount but to a shilling the square mile, while the difficulties of settlement continue; but let it be progressive with the produce, and commensurate with the prosperity of the country.

With the circumstances and wants of North America a new division of human labour has grown up; an army of wood-clearers. These anti-savages sell their farms in the states of New York and Vermont to European emigrants, or agricultural neighbours, and undertake to reduce into the like saleable state the untouched acres of Upper Canada. To them the sway of a republican master or a distant king, is alike indifferent. Where profit comes, lies their country. They purchase on five year bonds a lot of two hundred acres. The men come by themselves at first, fell or girdle the inconvenient timber, rear a log-house, harrow the cleared intervals, sow wheat, and then return for their families and cattle. The next year they bring their stock, their waggons, and their women, and improve their new houses into decent residences. In five years they have paid for the five simple of their farms; they have increased their stock; they are ready to hitch with added powers to the reputation of a simi-

lar enterprise; and they again sell with a large profit to the second order of settlers. So many of these primary colonists are now in organized movement, that some thousand families in a year will cross the lakes which separate America from British territory, and re-commence, on the opposite shore, their levelling operations. They perforate a wilderness in a summer, mince timber into wheat-halm, and lead bullocks to browse where the bear growled.

Care is taken not to move beyond reach of water-carriage, as there must be an annual exchange of the superfluous produce for the clothing, the metallic utensils, the glass and pottery of Europe. Farmers of skill and capital succeed with advantage to these inclosures; they combine more than one allotment, and place dependents in the supernumerary log-houses. The climate of Upper Canada is mild and inviting; the soil rich and productive; the winter useless to any purpose but amusement; and journeys are undertaken in sleighs or sledges of four or five hundred miles to visit the neighbours. The distance between Edinburgh and London is within the beat of regular acquaintance.

In such a country, population is constantly tending to dispersion, and no where to accumulation. Of course, manners are tending to rudeness, not to refinement. Education is confined to the ordinary utilities of milking cows, feeding poultry, killing sheep, flaying bullocks, ploughing land, and buying and selling. The last occupation has some tendency to preserve the knowledge of letters and figures; but where the labour of the youngest is valuable, and the distance of tolerable schools immense, there is a risk of the whites relapsing into Mohawk ignorance, and of having to bargain at talks for want of being able to sign a contract. Much land has been set apart in Canada for the church: why not grant it under the double tenure of performing worship on the Sunday afternoon, and keeping school on the Sunday morning? Parents will perhaps travel to worship, if their children are to be taught to spell and to cypher. A vernacular liturgy, in which the people take part, favours the diffusion of the art of reading. To so much of encroachment on the habits, whether catholic or presbyterian, of the Canadians, as tends to secure the loud reading of the forms of worship, one would wish the exemplary classes to incline. Yet we understand that the clerical situations in Ca-

and are so uninviting to any educated man, that the English clergy, who are mostly well born, the younger sons of our eminent families, and hence accustomed to the best society, unwillingly listen to offers of transatlantic preferment.

In Great Britain the press supersedes the importance of oral instruction; but in North America the antique provisions for a learned order are not less necessary now than during the feudal ages of Europe. Nor can a profuse removal into colonies which are just arrived at the maturity to require an insertion of European improvement, be any way so efficaciously stimulated as by inducing the chieftains of petty sects to become the leaders of migratory flocks. Whether this can be accomplished without a repeal of the act of uniformity, may be contentedly abandoned to the discussion of parliament or of the convocation.

Whatever may be the objections to the clerical order, as at present constituted in Europe, there is no doubt that in Canada it would be an impediment not to wisdom and tolerance, but to ignorance and fanaticism: it would keep alive a pious attachment to the mother country; it would import and diffuse both knowledge and manners. Barbarism and civilization are equally natural to man, and bear a pretty regular proportion to the rarity or density of populousness: barbarism is the name given to that set of manners which prevails where men are thinly scattered; and civilization is the name given to that set of manners which prevails where men are thickly scattered: retrogression takes place whenever populousness grows thinner, progression whenever it grows denser. European families transported to Canada must wilder in a generation or two: the precautions of the lawgiver ought chiefly to be directed toward securing those arts of life which are in danger of being abandoned there.

An important service might be rendered to Upper Canada not only by sending pastors, but flocks. Why not repeal the laws against *swaling*, and permit the exportation of our best breeds of sheep into Canada? The wool would return hither to be manufactured, and at a price which would facilitate to our manufacturers the supply of distant markets. The higher stages of cultivation are incroaching on our domestic sheep-walks; and wool is gradually ascending to a price which endangers our staple industry. Hides and tallow, as well as wool, might be brought

from Canada in greater abundance, and so might hemp and flax. The foundation of a naval arsenal in the river Saint Lawrence would give an expedient direction to the contiguous industry.

A curious delineation is that of the settling of wild land.

"Wild lands, that is, lands in a state of nature, have been sold as low as a quarter of a dollar per acre, for prompt payment; and much has been sold from that price to half a dollar per acre. In other situations, similar lands have produced from one dollar to two; but such prices in money are rare, and can only be obtained where a person happens to be settled in the neighbourhood, and to own adjoining land. But a new settler, or a person desirous of making a purchase, can always do it to great advantage if he can command money.

"The lands are usually divided into lots of two hundred acres each, forming a complete farm; that quantity of land being fully sufficient for any one farmer. Much land in this country is purchased with no other view than to sell again, a traffic concerning which I do not feel competent to decide, whether it should be considered as advantageous to the country or not. In many instances it has a good tendency, in others the reverse. Thousands of poor people come into this country to settle, without being able to advance money, not being possessed of any capital. A person so circumstanced is of course constrained to purchase on credit, which he does to great disadvantage, unless he happen to deal with a man of peculiar honesty. The terms usually are, to pay the purchase money by instalments, sometimes embracing a period of four or five years. In such cases, the vender usually gives the purchaser a bond, with condition to give a deed of conveyance at a certain period, provided the purchaser shall fulfil his several payments. Sometimes, in case of non-performance of these payments, the obligee in the bond avails himself of his advantage, and takes back the land with four or five years improvement upon it, and resells it to a fresh purchaser to a great profit. In truth, any person capable of advancing money may purchase very low, and sell at an advance of one or even two hundred per cent. profit, payable by instalments. This system affords an excessive advantage to the monied man, who takes security of the purchaser for the purchase money, with interest, which at once affords him an immoderate advance.

"The plan I here state is daily followed; and I can instance cases where people have actually improved their interest in the course of seven years more than one thousand per cent. The local situation of Upper Canada is such that it will ever be the most thriving country in America. The Americans are perpetually removing into this province, which produces a regular system of trade in that way. I could instance some few cases

where persons have purchased land for ten or twelve dollars a lot (of two hundred acres); who, in the course of twelve or fourteen years, have refused three hundred pounds for the same land. This may be termed land speculation; but however obnoxious the system may be to some minds, it does and ever will prevail in this country; and, upon the whole, I am much inclined to think that it is a beneficial traffic for the country. The bulk of the inhabitants are Americans, whose natural turn of mind leads to variety; for which reason they no sooner improve a new farm than they are desirous of selling it. No set of men on earth, perhaps, are so competent as Americans to engage in the difficulties of a new country; and Europeans, unacquainted with such a course of life, will find it better policy to purchase small improvements than to engage in such difficulties. I know of no method by which a capital can be improved to so great advantage as by adopting this system; but it requires some knowledge of the country before a person can form a just opinion either of the situation or value of lands. It may appear almost necessary to say what sort of persons, under these circumstances, can become purchasers. But my reply will be very general: almost every one. If a man has great industry, and a family sufficiently advanced to aid instead of encumbering him, he can, without any money, make a purchase of a single lot of two hundred acres; and, to use a common expression, make the land pay for itself, that is, from its own produce. If a farmer has three or four boys old enough to help him, they can easily clear twenty acres of new land; and, if they have ordinary luck, the first crop will yield five hundred bushels of good wheat, which, if the market price is a dollar, will produce one hundred and twenty-five pounds currency, that is, double the value of the land. Many persons have become purchasers of land, with no other view than that of selling on credit for large profit. Many hundreds indeed there are in this country who own from eight hundred to two thousand acres, yet began without any capital. I could enumerate many instances of individuals having maintained their families, and, in the course of seven years, collected from six to twelve hundred acres of land. True it is that this cannot at present be called a large property; but when a parent can reflect that he has secured for each of his family after him a comfortable farm, how satisfied must such a one feel. It has not been the lot of every one to be forced to these reflections: happy are they who have no necessity for them; but much more happy they who by their industry have rendered themselves independent, and their families after them."

If geographers would pay some attention to euphony in the imposition of new names, they would greatly facilitate to foreigners the pronunciation and recollection.

of such names. Why spell *Gwilliamsburg*: the *g* is no part of the Saxon *willhelm*, whence the English name *William* has been corruptly formed: this initial letter answers the double purpose of displaying ignorance and puzzling utterance. Why preserve unshortened the French names of places? Let *point au galop* become *Point Gallop*; let *point au barrit* become *Point Barrel*; and *point au cardinal* become *Point Cardinal*. Let us amalgamate the French topical nomenclature, and the other remains of their language, with our own, but so as to efface that appearance of strangeness, of quotation, which yet adheres to some of the phraseology adopted in this sketch. To revive the names familiar in the mother country may be natural. When the Persians colonized Egypt, they founded another Babylon and another Ecbatana; but these double nominations produce inconvenience. Baltimore cannot be spoken or written of without a descriptive qualification: contiguity suggests Baltimore in Ireland; celebrity suggests Baltimore in Maryland. Diminutive appellations would sometimes be more respectful as well as more convenient; Londonetta instead of London. Vowel terminations would suffice to discriminate, and would preserve every desirable recollection. The grand subdivisions ought every where to be named from the contiguous lakes and rivers, for this plain reason, that their situation is thus suggested by their name: the name of a French department instantly tells you where to look for it on the map. A system of geographical nomenclature might be contrived, which would greatly facilitate the remembrance of names and sites, by giving to names of mountains one termination, to names of rivers another, to names of provinces a third, to names of towns a fourth. Thus the province watered by the Niagara might be called Niagria, the chief town Niagron, and the mountain down which it falls Niagar.

At the peace of 1793 the Americans would probably have been content with a line of demarcation allotting the whole territory north and west of the Ohio to the owners of Upper Canada. Perhaps it is become worth the while of the British government to open a negotiation for exchanging New Brunswick and Nova Scotia against this unoccupied district. The coast thrives better under the free trade and maritime privileges of the United States: the interior settles faster under

the patronage of British capital, and the preference of British custom for produce. These provinces therefore would be served by an exchange, which, for a century to

come, will not be of importance to either government as a fund of taxation; and before that time the Canadas will have attained the age of emancipation.

ART. XXI. *A Sketch of the present State of France. By an English Gentleman, who escaped from Paris in the Month of May 1805. 8vo. pp 124.*

PEACE was unfavourable to the reputation of Bonaparte, and, had it lasted, would have occasioned his deposition. He is too ignorant in literature to appreciate the merit by which he is surrounded, too religious to be a welcome chieftain for the philosophic world, and too despotic to be obeyed with a disinterested alacrity. He has not the dextrous affability of Augustus, who could substitute the equalizations of politeness for those of republicanism. His internal government was harsh, unjust, and cruel; it united the mistrust of a Venetian with the severity of a Spanish inquisition.

War has restored to Bonaparte, in the eyes of Frenchmen, his original and peculiar value. His superiority as a general renders him the most desirable chieftain for his country. The odium which was laid against his assumption, his caprice, and his petulance, is become mute. Public gratitude and public confidence have superseded the sneers, and frowns, and sighs of a refined displeasure.

This writer speaks of him with the artificial ill-will of a sufferer, not with the indifference of a mere observer. He who determines to live free or die, will commonly domineer: he stakes more on his purpose than his antagonists. Moreau feared infamy, and feared the scaffold: without the senate he would not begin, and with the senate he would have shrunk from some of the *sine quâ non*s of usurpation. Singleness of view, however incompatible with the interest of mankind, where the cosmopolitical passion is not the ruling one, is almost a necessary ingredient of successful ambition. This character of greatness belongs to Bonaparte. Whatever actions are essential to his success should be criticised tolerantly. He is not to be compared with other men, but with other usurpers. To Septimius Severus he bears a close resemblance by his personal character and his innovative institutions; but being more adventurous and less accommodating, he is unlikely to bring his fortunes to an anchor: he must continue in full sail or be wrecked.

The conquests of the ancient Romans, like those of the British in Hindostan,

were rendered subservient to national opulence: the generals and proconsuls, like our nabobs, brought home fortunes which adorned the metropolis with edifices, and scattered a demand for luxuries. But the conquests of the French, although accompanied with profligate extortions, have not sensibly increased the proportion of rich residents in their metropolis. Paris does not flourish. Bridges are built, market-places and quays are cleared, public monuments are erected and embellished; but new houses, new streets, new villas, are no where climbing. The patronage of government is parcelled out in small shares among the civilized necessitous: it is not employed to attract the residence of provincial opulence. By the profuse confiscations, by the breach of entails, the consequent absolute tenure of land, its divisibility among mortgagees, and among heirs without preference of primogeniture, the huge estates have been crumbled, and the nobility has been minced into a yeomanry. There may be more ease, but there is less splendor. The country is thriving, not the chief city.

If Bonaparte wishes for trade, ships, and colonies, he must transplant his metropolis to Bordeaux. Commerce can do nothing for a town situate like Paris. It is inaccessible to shipping; and inconveniently approached even by boats: the Seine is a rapid stream, and in some degree a torrent: in dry seasons the shoals are hardly evitable. Many advantages would attend the transfer of the seat of government. Instead of the profligate population of an idle metropolis, Bordeaux would offer an orderly multitude, accustomed to maritime and industrious habits. A less vigilant and intolerant police would suffice to preserve order; the prevalence of occupation would check the tendency to revolutionary fanaticism. In a commercial town, public opinion operates habitually in favour of peace, of justice, of respect for property; not in favour of mutations that will supply talk. The tendency to French encroachment will eventually spend itself on Spain, and through Spain on the coast of Africa.

Bordeaux is a more convenient site of sway for an empire growing in that direction; and it is securer from the approach of German or Russian armies. Paris was built while civil architecture was in its infancy: the private houses are inconvenient beyond corrigibility; no water is laid in to the apartments; no stair-case is private; no room but is a thoroughfare. The loss of labour occasioned by the perverse distribution of the apartments makes the difference of a servant per family. The streets are as absurdly contrived as the houses: they are all narrow, and without foot-ways: there is no remedy but to rebuild. This reconstruction might as well take place elsewhere. Paris might remain the Athens of the French empire, the seat of colleges and museums, of literature and art; but the Rome, the imperial city, should be stationed on the imperial river, open to the ocean, should have navigable access to the interior, and be the natural mart of interchange for every thing domestic with every thing foreign. Paris has seen its acme: demolitions may awhile conceal the progress of ruin and desertion, and embellish the increasing vacancy; but commerce is become so much more powerful a principle in the creation or annihilation of cities, than the expenditure of courts, that the return of an eminent prosperity is impracticable to a place so ill situate for traffic and circulation.

The state of public welfare and opinion is thus sketched:

"A new quay has been opened from the *Pont Notre Dame* to the *Pont au Change* on the Isle of Paris, called the *Quai Dessaix*, in memory of the general of that name, to whom a monument has also been erected in the *Place Dauphin*, on a round pedestal, ornamented with the names of all the contributors to the expence on marble tablets.

"But these public edifices and decorations have nothing to do with the comforts of the people, and cannot be taken for the signs of a prosperous city. There are not ten houses now building in Paris and its suburbs; and some lately finished, in the best part of the town, near the *Faubourg* (or Suburb) *St. Honoré*, on the site of the Convent of the *Jacobins*, are without occupants.

"Nearly a twelvemonth has elapsed since the ground on the north side of the Garden of the Tuilleries has been cleared, from the *Place Louis XV.* to the *Carrousel*; and a carriage-way paved, with the name *Rue de Rivoli* pompously fixed up on handsome stone tablets.

"The ground of this intended street, lying on the side of the garden of the Tuilleries,

and opposite to the imperial palace (the best and indeed the only desirable situation in Paris), has to the present moment continued to be offered to let for the purpose of building; yet such is the want of capital and spirit, or such the apathy or doubt on the public mind, that not one stone has been laid.

"The Morgue, an edifice for the reception and exhibition to public view of the numerous bodies of nightly assassinated individuals, and of people found dead and deposited there to be owned, is a well contrived new building, lately opened, and is never empty of unfortunate objects.

"Great part of Paris exhibits nothing but raggedness and dirt. The inhabitants, however, contend, that it is cleaner since the revolution than before. They have therefore derived one advantage from this event, and one which they very much wanted; but much improvement will still be required to bring it into a state of wholesome cleanliness.

"A project is in contemplation to bring water to Paris, somewhat on the plan of the New River of London; but Paris, as it now exists, can never be supplied, in every house and in every family, with water.

"The height of the buildings, and the number of families in each house; the dearth of manual labour and of lead; and, above all, the little inclination a Frenchman has to lay out a sum of money, unless on the certainty of immediate profit, must prevent the distribution of water by pipes, cocks, and cisterns; the first expence of which could only be reimbursed by gradual savings, and by the comfort and convenience of the improvement.

"It is not the custom in Paris to take or grant a longer lease than for nine years: three is the usual term; and if the proprietor of a house sells it after having granted a lease, this is immediately void between the tenant and the landlord. To guard against this practice, it is usual to insert in the leases a fine on the landlords in case of their selling the property before the expiration of the term.

"This custom of short leases operates very powerfully in aid of the natural disposition of the Parisians to uncleanness in their houses, and inattention to repair them. They justify the continuance of the practice of only taking three, six, or nine years' term, in a building, by pleading the uncertainty of things, and the apprehension of changes in their political system and situation, and the consequent fluctuations in the value of property.

THEATRES.

"New theatres are still adding to the great number already existing in Paris, to gratify the taste of the inhabitants for dramatic entertainments.

"The *Théâtre Français*, the grand opera, and the comic opera, do honour to the scenic art, and are perfect exhibitions in their kind. The grand opera (not Italian) is a most magnificent spectacle.

"Being immediately under the controul and direction of the government, who contribute largely to their support, the theatres of Paris are in its hands great means of lulling and amusing the people, and of attracting foreigners to a place so dangerous to them in every respect, but particularly so since the revolution of Bonaparte.

"The small and very inferior theatres and shows situated in the *Boulevards* (ramparts), near the Gate St. Martin, many of them not to be ranked in some respects with Sadler's Wells, are well frequented by even the higher class of the city of Paris. These places of amusement, as well as the many public dancing-rooms, the open gaming-tables, and the innumerable coffee-houses, are always filled by this vivacious people.

"Attention to dress is more observed at the theatres of Paris by the audience than it was three years ago. Men who dress well universally adopt the English mode; but the embroidered liveries introduced by the courtiers of Bonaparte, may give for a time a new direction to the public taste in this respect.

"At the theatre of the Gate St. Martin, at the representation of a piece on the *taking of Seringapatam*, the audience clapped on the recital of a very illiberal assertion put by the author into the mouth of one of his personages of the play. 'The English are traitors,' said the actor; and the house applauded.

"Notwithstanding this symptom of prejudice, the war with England is not popular in France; though some among the few that think, believe it in some measure the cause of their country, or at least feel that it ought to be supported *as a war*: and though they reckon upon the talents of Bonaparte as a general, they certainly do not honour him as an emperor.

"A little piece is played at the theatre of *L'Ambigu Comique*, called *Tekili*, in which the health of a new-made emperor is drank on the stage. After the coronation of Bonaparte, a kind of pause seemed to be made at this passage, in order to observe whether the people would applaud with an allusion to the recent coronation of their Napoleon, but there was *not even a whisper of approbation*.

"A play under the title of Henry the Eighth had been forbidden on account of the marked applause which every passage alluding to the destruction of tyrants excited. After his coronation, Bonaparte ordered it, and appeared himself. His impudence, however, was not proof against the ordeal; for the house rang with redoubled and continued peals of applause at every sentence pointing at tyrants, and he quitted his box before the conclusion of the performance."

In a similar unaffected manner many other passing phenomena are related by this author, whose observations include the government, the army, the police, the law, the manners, the newspapers, and the trade of Paris. He speculates a

little about the revolution and its consequences, gives new particulars of Georges, Pichegru, and Moreau, and a scanty sketch of the general state of France. He describes the coronation; he treats of the pope and religion, and of the legion of honour. An important chapter is that which respects our suffering and imprisoned countrymen.

"The peculiar situation of the English now detained in France under the name of *hostages*, ought to excite the attention of their countrymen at home, who enjoy the privilege of personal liberty, the advantages of exercising their talents for the improvement of their fortunes, and the society of their friends, in a country of freemen. They were taken by surprise by the unexampled measure of Bonaparte's *arrête* for their detention, which was put in force while many of them were travelling in different parts of France at a distance from the capital, and where they could not know of the departure of the ambassador; and some of them were actually on their journey to leave the country.

"It is surely a reproach to a great and generous nation that the poor among their countrymen, unfortunate prisoners in an enemy's land, shut out from even the ordinary hopes of men whom the chance of war detains, should not experience the hand of liberality alleviating the misery of their helpless situation, except in the persons of their own countrymen in more easy circumstances detained in prison like themselves, who lately performed a play for their benefit. Are they forgotten?—as too often happens to those who languish in prisons!

"Let it now be known to the British public, that many of their countrymen are in extreme distress; and not a few are shut up in military prisons, by military authority, for having incurred debts for the ordinary comforts of life, which they are unable to discharge. Certainly our government could not treat on this basis till after a general peace: but the liberation of the hostages, now so cruelly detained, might be solicited, and in the cause of humanity, and to release such captives, it would not be a dishonourable or unpardonable submission for government to solicit justice as a favour, doing so with dignity.

"Till the late escape of his fleet from their confinement, Bonaparte has waged war on only those unfortunate men whom he has got within his power, and on the finances of England. Shall the people who have, in the latter respect, so nobly sustained the credit of their country against the attacks of an unprincipled enemy, suffer their defenceless countrymen, whom mere chance, and events which human foresight could not guard against, have put into his hands, to sustain in poverty the effects of his anger, and the malicious suggestions of his disappointments, without contributing to remove the evil of want, heaped on

them in addition to their other hopeless and melancholy circumstances?

"If the etiquette of government prevents them from being an object of its attention, it becomes more particularly the duty of spirited and liberal *individuals* to think of some effectual measure to alleviate the misery of their unprecedented situation.

"It has excited the wonder of the French people, to whom the active benevolence of the English character is known, that nothing has been done on this subject; for they particularly recollect how liberally the people of this country contributed to the support of the *French emigrants* in the beginning of the revolution.

"That there are indigent and worthy men among them, let the circumstance of the exertions made for them by *their fellow prisoners* be a proof to those who have no other means of judging.

"No doubt can be entertained that any sum which might be contributed by the people of England for the relief of the necessitous part of the hostages in France, would be well and judiciously applied and distributed. The care of managing it would be cheerfully undertaken by some of the gentlemen of fortune, rank, and consequence, who are detained with them."

In our opinion, this government ought to offer to exchange the prisoners of regular war against the detained English. The injustice of the detainer is a disgrace to Bonaparte; but it ought not, under a notion of protesting against such injustice, to be made unnecessarily grievous to the individuals seized. The wisest revenge for injustice is the affectation of an opposite generosity: the fear of shame accomplishes what retaliation cannot effect.

Release without ransom, parole, or exchange, as many Frenchmen as there are Englishmen confined at Verdun; and desire these Frenchmen, on their return, to solicit the release of the detained English. Such at least, at the beginning of the contest, would have been the noblest and the wisest course: but magnanimity comes with ill grace as an after-thought.

There is the more reason to hope that, if any pretext were afforded to the French government for the release of the hostages, they would immediately be set free, as the real object of detention is at an end. While the invasion of Great Britain was in project, the English newspapers threw out the abominable proposal to take no prisoners among the invaders. This refusal of quarter to the conquered and the suppliant is so contrary to the usages of civilized war, and so outrageous to every feeling of humanity, that a French army refused to put it in practice when decreed under Robespierre by their government. Against the threatened and possible massacre of prisoners the seizure of these hostages was intended as a precaution. It was felt that few English would be taken on land or sea, and that the guests, who confided in the rights of hospitality, were perhaps the only ones whom their power could reach: they were seized, that the means of retaliation for any irregularity might exist. Now that invasion is postponed indefinitely, a release would probably be acceded to, especially if a little private bribery were to corroborate official arguments.

CHAPTER II.

T H E O L O G Y

AND

ECCLESIASTICAL AFFAIRS.

THE articles in this department will be found less numerous and less valuable than usual. The strength of our theologians has been spent upon sermons; but, we are happy to add, not spent in vain.

I. A single work appears in our first class. *Dr. Stock*, whose translation of *Isaiah* was noticed in our second volume, has undertaken a *New Version of Job*, in which, if he has not been completely successful, he has continued to exhibit himself as an able scholar in Jewish literature.

II. In sacred criticism, *Mr. Winstanley* claims the first post. His *Vindication of certain Passages in the common English Version, addressed to Gran. Sharp*, though short, is honourable to his character as a scholar and a divine. *Mr. Nisbett* appears again, with credit, in defence of the hypothesis he has long been labouring to prove respecting the *Second Coming of Christ*. *Mrs. Trimmer* has published a bulky volume of *Annotations upon the Old and New Testament*, which she has entitled, "*A Help to the Unlearned*," but which we fear will, in many respects, be found a hindrance to them in the proper study of the scriptures. *Mr. Parker* has compiled from the best authors, and for the use of young persons, *Explications of remarkable Facts and Passages in the Jewish Scriptures, which have been objected to by Unbelievers*; and *Mr. Granville Sharp* has opened again his formidable battery against the church of Rome, in *An Enquiry whether the Description of Babylon, in the 18th chapter of Revelations, agrees perfectly with that of Rome as a city*.

III. Two works only, and those of very different merit, have appeared in support of natural and revealed religion: *Mr. Watson's popular Evidences of Natural Religion and Christianity*, and *Mr. Nares's connected and chronological View of the Prophecies*.

IV. Nor is our list of controversial theology, for the present year, long, or marked by any work of extraordinary value. *Mr. Robinson*, of Leicester, has stood forth the champion of modern calvinism, with three volumes, entitled, "*The Christian System unfolded*." A short but interesting controversy has taken place between *Mr. Smith* and *Mr. Belsham*, in consequence of some reflections upon calvinism in the sermon preached by the latter on occasion of the death of *Dr. Priestley*. An ironical writer, who calls himself *Basanistes*, has attacked the trinitarian hypothesis, in a work quaintly entitled, *Αἰρετικὴν Ἀναστασιν, or a new Way of deciding old Controversies*; and *Mr. Wright*, of Wisbech, also a unitarian writer, has published a work on the doctrine of the Atonement, and which he has called "*The Anti-satisfactionist*."

V. Our catalogue of sermons is larger and more valuable than usual. *Wellwood, Cappe, Kenrick, Napleton, Gilpin, Townsend*, are names that will appear with honour

amongst the most eloquent or the most instructive of English preachers. *Monkhouse, Adams, Morton, Partridge, and Dore*, will not be generally thought to have contributed much to the large and valuable stock of this branch of theological literature, which we already possess.

Single sermons upon various subjects have been published by *Headlam, Phillpots, Gardiner, Mosely, Hall, Poulter, Belsham*, and others.

In *practical theology* we have *Hawtreys Guide to Heaven; Oakley's Holy Family*, and an excellent little *Treatise*, by Mr. Fellowes, on *Death*.

VI. It is not yet ascertained who are the true churchmen. Dr. Lawrence, in *Eight Sermons preached at the Lecture founded by Mr. Bampton*, has endeavoured to vindicate that character to those who give an arminian interpretation to the thirty-nine articles. An *anonymous* writer has re-published, from a respectable monthly work, a "*Candid Examination of Mr. Daubeny's Vindicia Ecclesie Anglicanae*," on the contrary side. Mr. Overton himself also has again come forward in *reply to some occasional strictures on his former Work* in the preceding article, with *incidental Remarks on Dr. Kipling, &c.*

The schism in the society of Friends is not, nor, we fear, is it likely to be, healed. The only tracts connected with this curious and not important part of modern ecclesiastical history, which have this year come before us, are a *Memoir by Mr. Rathbone*, author of a *Narrative of Events in Ireland, &c.* and *Bevan's Defence of the Christian Doctrine, &c.* Two other publications relating to the society of Friends are noticed, the one in our political, the other in our miscellaneous chapter. The most important work, however, relative to ecclesiastical history, in our present volume, is an *Essay on the Reformation*, by Villars, written originally in French, and of which two English translations have been published.

VII. To these may be added the following miscellaneous articles: *the First Report of the British and Foreign Bible Society; Lavater's Letters of St. Paul the Apostle; and The Christian Mirror.*

Of all these works we shall now, according to the best of our judgment and ability, proceed to give such an account as shall convey to our readers some just notion of their respective value. Paying all due regard to the feelings of the different authors; and anxious rather to shew the opinions of others than to obtrude our own, we shall carefully refrain from all unnecessary censure, and confine ourselves as much as possible to the method of analysis. There may be means of making works of this nature more amusing; but none, we are firmly persuaded, by which the end in view can be more properly and surely obtained. We could, perhaps, have entered into controversy with most of the writers that have appeared before us; we could have combated many of their principles, and proposed and defended our own; but how often would our duty have been fulfilled? We do not consider ourselves as the guardians of any particular creed, but as pledged to give a fair statement of the design and execution of the theological works of the year. For ourselves, we are accustomed to read, to reflect, and to judge; and in the exercise of this right, we have embraced sentiments which we highly esteem, and which, on all proper occasions, we are prepared openly to avow, and strenuously to defend. But to the public it is of little moment whether we belong to the school of Geneva, of Leyden, or of Cracow: our private sentiments, when we appear as reviewers, shall as much as pos-

able be confined to our own breasts, and in no case be made the standard by which the sentiments of others shall be tried.

THE SCRIPTURES.

ART. I. *Vetus Testamentum Græcum cum variis Lectionibus. Edidit ROBERTUS HOLMES. Folio.*

ΔΑΝΙΗΛ, ΚΑΤΑ ΤΟΝ ΘΕΟΔΟΤΙΩΝΑ ΚΑΙ ΚΑΤΑ ΤΟΥΤΕ Ο.

Daniel kata ton Theodotiona kai kata tous 'Ebdomekonta.

DR. HOLMES has long been known in the literary world by a sermon on the Resurrection; by his Hampton Lectures; by four Tracts; by an Ode to the Duke of Portland; but especially by his Epistle to Bishop Barrington, which, in the year 1788, we believe, announced and introduced his intended collation of the best manuscript copies and printed editions of the Greek Old Testament; and by the subsequent but leisurely progress made in the execution of that laborious task. Whether the oil of patronage, or the bur- nish of praise has been wanting to overcome the natural friction of weariness or indolence, we know not. We regret, for the honour of British theology, that so splendid and meritorious an enterprise should not animate to more active perseverance, but, like a wounded snake, drag its slow length along.

Even the first tome of the *Vetus Testamentum Græcum cum variis Lectionibus* made its appearance at the Clarendon press only in 1798. The general character of the edition has so amply been discussed and so willingly commended in those journals which could commemorate its birth, that we can no longer hope to enhance its celebrity, or to influence its conduct. The collators have now travelled on to Daniel: there will be more of novelty in discussing the fitness of thus comprehending this book in the canon of scripture, than in transcribing from Scharf- fenberg, *Specimen animadversionum, quibus loci nonnulli Danielis et interpretum ejus vocem præsertim Græcorum illustrantur, emendantur*. That is the most useful sort of commentary on the sacred writings, which enquires concerning their antiquity and their readings, with a view to their historic value.

The present edition professes to contain the Greek translation of Daniel by Theodotion, which is arranged first; and the prior Greek translation of Daniel, made at Alexandria, which is arranged last. From Theodotion's version has been lopped the story of Susanna; from the Alexandrian version has been lopped

the song of the three holy children: thus neither of the promised texts are honestly given, both having been garbled into resemblance with the canonical Daniel.

Theodotion of Sinope was born of orthodox christian parents, and educated in their religion, which he professed awhile at Ephesus. Having read the book of his fellow-citizen, Marcion, entitled, *The Antitheses*, which attempted to point out inconsistencies and contradictions between the Old and the New Testament, he became, like Marcion, a believer in the christian scriptures only. Afterwards, conceiving these christian scriptures to be the less strongly authenticated of the two, he renounced christianity, and turned a Jew, in which faith he died. His translations from the Old Testament are thought to have been made about the year 185, under Commodus, and are said to have been imposed as a penance or expiation for his having been once a christian.

The Alexandrian version was made nobody knows when, nobody knows by whom: the newest authorities incline to the suspicion that it was completed during the reign of Augustus, with the patronage of Agrippa, under the superintendence of Philo-Judæus. Aristæus says that seventy men were shut up separately by king Ptolemy in seventy cells, and that all the seventy translated all the bible precisely in the same words: from this silly legend results the denomination of the *Septuagint*, or seventy men's version; an appellation, which only popish credulity should condescend to repeat, and which we are shocked to observe in the title-page of a protestant publication.

To the curtailed texts of these two Greek versions are appended in this edition a laborious collection of readings, derived from various manuscripts, and editions of manuscripts, especially the Chigian. We observe no citation of the version of Daniel, edited at Strasburg in 1784, by J. B. G. d'Anse de Villosion, along with the Proverbs.

Some persons have supposed that the

mention of Daniel the prophet, by the founder of christianity (Matthew xxiv. 15) confers a sanction on the specific application of passages in Daniel to the times of Christ. The work in question was certainly a sacred book of the Jews, appointed or allowed to be read in synagogues, a national classic, and therefore adapted to supply the orator with allusions: but the specific application, as professor Paulus observes (Commentar über das neue Testament, vol. III. p. 406) amounts to no more than this—*ut verbis Danieliticis utar*—and does not in the least imply any ascription of foresight to the author, whose phraseology is quoted. There is no irrelevance therefore in discussing the real origin of the book.

The proper canon of Jewish scripture appears to have been closed by Nehemiah, who (11 Maccabees, 11. 13) 'founding a library, gathered together the acts of the kings, and the prophets, and of David, and the epistles of the kings concerning the holy gifts.' To this collection Judas Maccabeus added some apocryphal books; for it is further said (v. 14), 'in like manner also Judas gathered together all those things that were lost by reason of the war we had, and they remain with us.' It is a question of some curiosity whether the book here published with the superscription 'Daniel' can have been extant in the time of Nehemiah; or whether it be one of the deutero-canonical writings first deposited in the temple-archives, under Judas Maccabeus.

A short recapitulation of the leading circumstances in the life of Daniel will point out those events and ideas, which were most likely to be strongly impressed on his mind, and familiarly alluded to in his writings. The date of Daniel's birth is not precisely known. He was taken captive by Nebuchadrezzar, in the third year of Jehoiakim, carried to Babylon, and brought up in the schools there. Whiston, in a note to Josephus, suggests with probability that he and his companions were made eunuchs; indeed the fourth and fifth verses lvi. Isaiah, apparently apply to these captives, or hostages. As the Persians were accustomed to make eunuchs only of the immature, Daniel could hardly be more than twelve years of age at the time of his translation. He was consequently born about the twenty-eighth or twenty-ninth year of the reign of Josiah. That he was son to this king is nowhere stated; there is even an apocryphal text which calls his father Abai: yet the

words ascribed to Isaiah in 2nd Kings (xx. 18.) as well as the passage in Daniel (1. 3.) render it evident that it was systematic with the Babylonian court to extinguish among subdued princely families the hope of further posterity, fearing the rebellious adolescence of hereditary claimants; and that among the children of the royal family of Palestine were selected the clients of this mortifying patronage. Daniel (ix. 24.) was born at Jerusalem.

If Xerxes, as well as Artaxerxes, (Josephus Ant. xi. 6.) was called Cyrus among the orientals, and if Daniel continued (i. 21.) until the first year of this prince, he lived in all about eighty-six years: twelve at Jerusalem; thirty-seven at Babylon, Ecbatana, and elsewhere, under Cyrus the great; thirty-six at Susa and Persepolis, chiefly under Darius I; and one under Xerxes.

When Cambyzes undertook the invasion of Palestine, it was natural for the court of Babylon to attach Daniel to that army; as his local knowledge and powerful connexions in Jerusalem were likely to facilitate essentially its success. Daniel does not appear to have approached Jerusalem during the siege, but to have staid at Riblah with Cambyzes.

Cyrus the great was killed in warring against the Visigoths who then occupied the northern skirts of the Persian empire: his descendants had not that personal reputation which was necessary in his successor. Cambyzes learnt his father's death in Ægypt, and hastened toward Babylon to claim the sovereignty: he died suddenly on his way of a wound, which was conveniently ascribed to accident. Merodach the second son, or as Æschylus calls him Mardys, next ascended the throne; but was hurled from it by the management of Otanes, under the pretext of his being an impostor. (Herodotus, Thalia 68). Seven leading men declared for Darius; but the Babylonians, faithful to the posterity of Cyrus, defended their city against Darius, in favour of Belshazzar, or Balthasar, a minor son of Cambyzes. The people of Nineveh too, attempted to re-establish there an independent sovereignty under the Nebu-saradan, or Sardanapalus, whom Cambyzes had employed against Jerusalem. Darius, who was a Mede, took both Babylon and Nineveh, and became sole master of the Persian empire.

This success he owed principally to Daniel; who, though courted by Belshazzar (v. 29.) gave to this prince unwelcome

oracles (v. 26.) and from his immediately subsequent promotion (vi. 2.) under the usurper, must long have been a secret friend of the son of Hystaspes. The new division of the provinces by this prince (vi. 1.) and by Daniel, is also noticed in Herodotus (Thalia, 89) who makes twenty larger divisions, including no doubt the one hundred and twenty smaller ones of the Jewish account.

Throughout the Persian empire the fire-worshippers and idolaters, the monotheists and polytheists, had long formed two inveterately hostile but nearly equiponderant sects, who were perpetually caballing for the patronage of the sovereign: as was nearly the case also in Palestine under the Jewish kings. With Darius the idolaters came into disfavour; and the massacre of their priests by his party (Thalia, 79) was commemorated in an anniversary festival. The Jews (Esther ix. 15-19.) lent zealous assistance on this occasion. Arioch, chieftain (Judith i. 6.) of the Elamites, a Jewish clan (Nehemiah vii. 12.), who was captain of the king's guard (Daniel ii. 14.) and intrusted with the execution of this severe measure in Babylon, appears to have been on very courteous terms with Daniel (ii. 15.), and to have concerted with him (ii. 24.) various exemptions from the proscription.

Nor was Daniel less active in securing the allegiance of Nineveh. Diodorus Siculus records his interference under the name of Belesis. He was named Belteshazzar (Daniel v. 12.) by his sovereign: the termination *tsar* appears from Forster's letter to Michaelis, to have been a Medic title; Beltesh therefore is the name represented by the Greek Belesis. After the subjugation of the whole empire by Darius, no further mention is made of Daniel. When Darius, by taking Esther to wife, married into the royal family of Palestine, one would have expected to find Daniel attached to her fortunes, as well as his kinsman Mordecai: perhaps the whole revolution which overthrew Haman or Intaphernes, which divorced Vashti, and made empress the Jewish princess, was the work of the powerful mind of Daniel. The influencing ministers of Persia were often derived from the schools of the eunuchs.

Let us now turn to review the various composition ascribed to him, which, in the form given to it by Theodotion, is a translation from a work partly written in Hebrew, and partly in Chaldee. If Daniel had been drawing up a book for the

people of Palestine, he would employ their vernacular language, that is the Chaldee (as we absurdly call it) or Syriac; if he was drawing up a book for the instruction of the Persian empire, he would employ the Hebrew, which was the language of Babylon in his time: but he would not employ both, that would unfit his book for either purpose. Still less would a man during his boyhood familiar with the one, and during his education with the other dialect, think of editing a book in Greek (a language to which he was born and bred a stranger) and then of translating it first into Chaldee, and next in part into Hebrew. Yet such is the history of the biblical book superscribed Daniel. Not only the Greek words *πρωτιμοι*, *φθεγμα*, *κρηυξ*, *κρηυσσειν*, *κιθαρς*, *κιθαρα*, *σαμβυκη*, *ψαλτηριον*, *πετασος*, occur in the Hebrew, or rather macaronic Daniel; but even the word *συμφωνια* which cannot have presented itself to a person, who was not translating from a Greek text. Nor would any of these words have mingled in the vernacular dialect of Palestine, before the Macedonian conquest. Neither the text of Theodotion, nor the prior text of the Alexandrian version, can have preserved the archetypal Greek Daniel; for both contain marked orientalisms of diction. The text of Theodotion is borrowed from that Daniel which is included in the received canon; that of the Septuagint has variations, which indicate, that very different editions, or copies, passed for original in early times.

Not only the dialect but other circumstances prove that this book must have been drawn up in Palestine, by a person ignorant of the Babylonian court. Both Cyrus and Darius were monotheists, or fire-worshippers, like the Persians and Medes, among whom they originated. The viands set on their tables were not offered to idols. But here Daniel (i. 8.) and his companions are made to object generally to the food on the king's table, as if to partake it was a breach of the Mosaic law. Had they refused only pork, their conduct would be in costume; but they are described as refusing wine, which could to them be unclean food only in case it had been partly shed in libation to idols. This passage is symptomatic of the times of Antiochus Epiphanes, and the Maccabees, when every faithful Jew was called on to bear habitual testimony against polytheism, and to abstain from meats offered to heathen gods. Yet this passage is in the Hebrew portion of the book.

The image of gold set up by Nebuchadnezzar in the plain of Dura is sixty cubits high and six cubits thick: it is not a miraculous production, but a work of human art. Michaelis has been at the pains to calculate its solid contents, and estimates the worth of the gold at three thousand four hundred and eighty millions of dollars. There is hardly so much in the whole world: this wonderful effort of foundry cannot therefore have been described by an eye-witness, if it has been described by a man of veracity. It is a statue, which, if coined into darics, would more than discharge the national debt of Great Britain. Darius was no maker of golden statues; the pecuniary wants of his ambition tempted him to invade the sepulchres of the dead (Clio, 187), and the temples of religion (Clio, 183); and, although he is stated to have replaced the statue of Bel, which he coveted and had ventured to remove; yet if there be a historical basis in this extraordinary narrative, that very seizure of the statue of Bel, which, according to Herodotus, was only twelve cubits high, must be the basis.

The transformation of Nebuchadnezzar for seven years into a wild beast is narrated in the fourth chapter; this chapter offers a fine harvest of various readings: but those only which affect historical statements can merit discussion.

At the close of the fifth chapter, instead of Darius the Mede, as in the common version, Artaxerxes the Mede is made in the Alexandrian version to acquire the kingdom; Darius being fall of days. It is evident that the phrase Darius the Mede cannot have come into use, until there had been a second Darius who was not a Mede; and consequently that the Chaldaic text is subsequent to the reign of Darius the second. It is also evident that the author of the Alexandrian text must have flourished after the accession of Artaxerxes Memnon, who followed Darius II; for he makes an Artaxerxes succeed to a Darius, an order of names which had not occurred in the list of Babylonian emperors before that date. These circumstances however do not quite suffice to prove that the book of Daniel was composed after the time of Nehemiah's compiling the canon; because Nehemiah in the received chronology is placed too soon.

The new division of the provinces of the Persian empire (vi. 1.) is rightly ascribed by the text of Theodotus to Darius the Mede (Herodotus, *Thalia*, 89) and

wrongly by the Septuagint text, as it is here called, to Artaxerxes. The Septuagint text of the 28th verse also contains an historical blunder, and makes Cyrus succeed to Darius instead of Darius succeeding to Cyrus. This verse has been the real cause of that wild supposition advanced by sir Isaac Newton and others, that Cyaxares and Darius are one.

The seventh chapter, like the first, is written in Hebrew; but its oracular allusions so closely resemble those contained in the Chaldaic portion of the second chapter, that one cannot well avoid ascribing a common origin to them both. An attempt may have been made to translate the whole book out of the vernacular Chaldaic into the sacred language, or Hebrew, which began with the seventh chapter, as the prophet is there first introduced speaking in his own person; and this attempt may next have been extended to the biographical or legendary part of the book, but have been broken off by some accident, before two chapters were gone through with. The Greek texts conceal this solution of continuity. The oracular passages have been well commented by Grotius, and, after him, by Collins, in his scheme of literal prophecy considered (p. 148 to 200); the clue, or key, through this labyrinth of hieroglyphic imagery is to be found in the 8th chapter (v. 20-25), which though a sufficient passport in Ptolemy's time, is so no longer. Michaelis, by a more industrious consultation of the first book of Maccabees, has added several satisfactory elucidations to those of Grotius and Collins; but at the ninth chapter he abandons the literal, or natural, for a mystical and supernatural scheme of interpretation: he avoids to perceive the punctuality with which the author of Daniel (ix. 24-27.) paints the condition of Jerusalem under Antiochus (1 Maccabees, i. 54.) and under the short but enthusiastically welcomed toleration of Lysias (1 Maccabees, vi. 58.) who is described as a Messiah, *who was to be cut off, but not for himself* (Daniel ix. 26.) and who in fact suffered (1 Maccabees, vii. 2-4.) for the son of Antiochus. The author of Daniel also alludes to the destruction of the sanctuary (Daniel, ix. 26.) which was probably accomplished by the people of Demetrius, when they encamped before Jerusalem (1 Maccabees, ix. 3.) and slew Judas. Thus it appears that all the allusions to real events in this oracular composition center on the times of Antiochus and the Maccabees, and no where stretch beyond

them: and this so exactly, that the destruction of the sanctuary, of which Judas Maccabeus was a witness shortly before his death, is mentioned in Daniel, whereas the death of Judas Maccabeus is not mentioned. It seems therefore as if Judas Maccabeus himself, or somebody under his immediate inspection and direction, was engaged in accommodating the book of Daniel to the events of his own times, for the purpose of inrigorating that religious loyalty for which his partizans were distinguished. So confidently may it be classed as a portion of his secondary canon. That the book of Daniel was in great request among his followers may be further inferred from the second chapter (v. 59-60.) of the first book of Maccabees.

The commentary of Michaelis on the concluding chapters of Daniel is as satisfactory as it is learned: he apologizes honestly for his difficulties after the thirteenth verse of the eleventh chapter, where the narrative of Polybius quits him. He corroborates the main inference that every historical allusion descends only to the time of Judas Maccabeus. Of Michael, (Daniel xii. 1.) Michaelis makes an allegorical personage, a guardian angel of Palestine: from Ouseley's epitome of the ancient history of Persia, it may be suspected that Ardavan became powerful at this era, and supported the Jews against the Greek sovereigns of Babylon. Michaelis concludes his exposition with this remarkable sentence '*In der That, kaum eine Weissagung ist so wunderbar verstanden worden, als diese, so dass wir, wie ich schon mehrmals gesagt habe, die Erklärung ihrer letzten Hälfte nicht den Kirchenvätern, die sie aufs wunderbarste erklärten, sondern in der Hauptsache dem Feinde der Religion Porphyrio zu danken haben.*' Indeed scarcely any prophecy has been so strangely expounded as this: so that, as I have often observed, we are not indebted to the fathers of the church, who expound it most wildly, but to Porphyry, the foe of religion, for the main groundwork of explanation.'

Having shown that this second Daniel must be referred to the times, if not to the hand of Judas Maccabeus, it merits enquiry which are the poems that may with probability be ascribed to the first and real Daniel. Doubts may rationally be entertained concerning the appropriation of the Hebrew oracles. Jeremiah is whole appears to have collected his own elegies, not Ezekiel his oracles, nor

Zechariah his panegyrics. Odes are scattered among the productions of these writers of loftier tone and more studious composition than the works which they intersperse.

In the time of Nehemiah all these writings were probably deposited in arks, or chests, belonging to the temple of Jerusalem; each on the separate *napkin* which had been hung up for its original promulgation. In Arabia it was long an habitual form of publication to suspend a new poem for perusal (sir W. Jones's works, iv. 245) at the gate of some public building. Cotton cloth (Arrian, 717) and linen cloth (Pliny, xiii. 11) was in early use to write on throughout the east. The squareness of the Babylonian character adapted it peculiarly for nations who wrote on a woven material: now this alphabet, in the time of the prophets was still in use; and consequently the connected practice of writing on linen. Baruch (Jeremiah, xxxvi. 18-28.) writes with ink on a roll, which could be burned in the king's presence, and was therefore not of parchment. Isaiah, or more probably Jeremiah, alludes (Isaiah, xxii. 25.) to the nailing up of burdens, or oracles. Habakkuk (ii. 2.) undertakes to write his oracles in letters so large that he who runs may read. A misarrangement of such autographs may easily have given occasion to erroneous superscriptions; when these napkins or literary fragments, were first transcribed on continuous rolls of linen.

It remains to be enquired whether any internal characteristics will authorize a partial correction of the received distribution.

Whoever reads the first twenty-four chapters of Ezekiel will be struck with the identity of manner which pervades them. The poet is evidently a man of vigorous and busy imagination, but of low and ignoble taste. He appears to know Jerusalem and its neighbourhood, and the banks of the Chebar (Chaboras) from Carchemish to Tel-abib: with the rest of the world he betrays little acquaintance. His favourite formula is to begin with a parable or allegory, which he leaves awhile wholly enigmatical, and then explains by the narration of a corresponding event. He is a diffuse writer: not content to indicate he completes all his images, describes from head to foot with needless detail, and instead of selecting the finer groupes, parades before us the entire procession of his thoughts. Of his writings the tenour is didactic chiefly, although

the nineteenth chapter might pass for a fragment of Jeremiah, and they seem intended for the perusal of fellow-captives.

From the xxvth to the xxxiind chapter inclusive, a distinct and loftier vein of poetry prevails. Nothing low or spun out here requires apology. All is dignified, simple, concise, sublime. A profusion of geographical knowledge is sedulously displayed, such as might be expected from a professed historiographer of the campaigns of Nebuchadrezzar. These poems all relate to one or other enterprise of the kings of Babylon, and are rather adapted to metropolitan readers than to captive jews. They were evidently written on the spur of the occasion; since, at the moment of the blockade of Tyre, the poet does not hesitate to threaten, or announce, its capture (c. xxvii.); but in a subsequent poem (xxix. 18.) he owns that the siege had been unsuccessful, and that the king was marched forwards to Egypt. For this miscalculation, for this want of foresight, the poet apologizes, and, apostrophizing Ethbaal, the king of Tyre, says nearly: 'It is true, I called your resistance proud; but I perceive you estimated rightly your strength: you were wiser than I.' And on this occasion the poet names himself (xxvii. 3.) Daniel.

The xxxvth, the xxxviii, and xxxix chapters are composed in a similar strain: the two latter evidently relate to some expedition against the Scythians, and probably to that defeat of them which Herodotus (Clio, 105.) places in the reign of Psammeticus, or So, king of Egypt: in which case the poem cannot well be cotemporary with the victory celebrated. It may have originated on a recent view of the whitening bones of the Gothic invaders.

Again; if the first forty-five chapters of Jeremiah be attentively perused, the reader will be struck with much identity of character. An unrelenting hostility to idolatrous rites, and an anxiety to transfer the allegiance of his countrymen from the Egyptians to the Persians, distinguish the matter of this author: a love of paraphrase and tautology, his manner. A complaining, evil-boding strain characterizes the whole. His finest passages are the pathetic descriptions of occurring misery during and after the siege of Jerusalem. The habitual want of bright and bold imagery tallies with his unvaried wailing cast of expostulation. Very few

exceptions offer. The xxxiind chapter indeed seems more modern than the preceding one, and of opposite tenour, and it brings out those trains of idea and allusion in which Zechariah delights. The xxvth chapter, from the 15th verse onwards, might be thought to form a distinct oracle. The Lamentations, which are in the best manner of Jeremiah, partake closely the same general character of composition as these forty-five chapters.

But from the 13th verse of the xlvi chapter, to the 58th verse of the fifty-first chapter, intervenes a spirited, vigorous, concise vein of poetry, full of boldness and sublimity, delighting in images of war, and descriptions of conquest, and occasionally borrowing decoration from idolatrous mythology. Geographical allusions are profusely scattered: names of places are accumulated with triumphal complacency: and the poems all relate (there are nine distinct odes concerning Egypt, the Philistines, Moab, Ammon, Edom, Damascus, Kedar, Elam, and Babylon) to one or other achievement of the armies of the Persian emperor. Now as these nine oracles occupy, in the Alexandrian version, a different order and place, in the book of Jeremiah from that assigned, to them in the established version, it is natural to infer that they have been hesitatingly and arbitrarily ascribed to this prophet by his posthumous editor, and that they belong, like the minutely similar matter scattered in Ezekiel, to Daniel.

Thirdly; of the many poems ascribed to Isaiah, who flourished under the kings Jotham, Ahaz, and Hezekiah, few allude to contemporaneous events, or to persons of his æra. Most exhibit symptoms of a posterior date. Thus the xith chapter, by mentioning the branch of the stem of Jesse, announces itself as from the times, if not from the hand of Zechariah, who was the poet of the restoration. The xvth and xvi chapters, which profess to have been written within *three* years (xvth 14.) of the destruction of Moab, must consequently be by a whole century posterior to Isaiah: Moab having been overthrown (Josephus, Ant. x. 9.) about five years later than Jerusalem. The liiind chapter is probably a lamentation of Jeremiah for the death of Zedekiah. Other chapters, as the lixth and following, abound with trains of sentiment natural and usual only to prophets who, like Zechariah, wrote after the return of the jews from captivity. Here also occur some poems closely resembling the war-

songs scattered in Ezekiel and Jeremiah.

Such are the *xxi*th to *xix*th chapters inclusive; the *xxi*st and *xxiii*d chapters, the *xl*th chapter to the *12*th verse of the *li*nd chapter, and perhaps some other fragments. These poems share more or less that loftiness, that art, that proneness to geographic allusion, and that concentration of attention on the Babylonian sovereign, which characterize, it seems, the other odes of Daniel. It is moreover evident, that the *xv*th and *xvii*th chapters of Isaiah have the same author as the *xlvi*th chapter of Jeremiah; and that the *xxiii*d chapter of Isaiah has the same author as the *xxv*th and *xxviii*th chapters of Ezekiel; so great a resemblance and conformity would have been avoided as plagiarism by two distinct writers; but the same poet may well be supposed, in a subsequent edition, to have indulged this ample variation. It follows that these poems may, with much confidence, be ascribed to Daniel.

Were a chronological arrangement of these compositions to be attempted, it would be necessary to consult the historical order of the events which they celebrate. Cyrus is named in some of them, and forms a leading hero. This prince (Herodotus, *Clio*, 177.), after the conquest of Sardis, raised the army which was led against Labynitus, leaving Harpagus, the Mede, in Asia Minor, with the forces requisite to keep under the newly conquered Lydians. After the taking of Babylon (*Clio*, 191.) Cyrus interfered in the affairs of Egypt, and favoured the rebellion of Amasis against Apries, or Hophra. Jerusalem being at that time a satrapy dependent on Egypt, was probably the price of this assistance; and hence the first siege, in which Daniel and others were made captives, and taken to the Chaldean schools. Jerusalem was first acquired by the Babylonians in the reign of Manasseh (*ii* Chronicles, *xxxiii*. 11.), and was conquered from them by Necho, king of Egypt, at the close of Josiah's reign (*ii* Kings, *xxiii*. 29.). After some years, Cyrus, choosing to march against the Massagetai, or Visigoths (*Clio*, 208.), invested Cambyzes with the vica-royalty of all the region dependent on Babylon, under the title apparently of king of the Chaldees (*ii* Chronicles, *xxxvi*. 17.). This prince, dissatisfied with the equivocal allegiance both of Zedekiah and of Amasis, undertook the regular subjugation of Syria and Egypt, summoning to his aid some troops from Asia Minor. If Harpagus

still commanded these troops, he must be the Holofernes whom Judith slew. They will have taken Damascus in their way to the rendezvous at Riblah, and will thence have proceeded conjointly with the troops from Babylon, and under the command of Nebuzaradan (Jeremiah, *lii*. 30.), to the conquest first of Jerusalem, then of Ammon and Moab, next of Gaza and Ascalon, and finally of Egypt. Cambyzes joined the army in person at a more advanced period of the war, after the commencement of the siege of Tyre, and by a march through the Arabian desert (*Thalia*, 7.). Many of these incidents are mentioned by the prophet.

First should occur among his works, if arranged according to the order of event; the *xviii*th Isaiah, and so much of *xl*ixth Jeremiah (23—27.) as relates to the misfortune of Damascus: these compositions appear however to be considerably subsequent to the siege which forms their theme: they confirm the account in the book of Judith (*ii*. 27.), that the plain of Damascus was laid waste in harvest-time.

The second siege of Jerusalem is not sung: the patriotism of the poet could not bear to triumph, his loyalty did not dare to lament.

The expeditions against Ammon, Moab, Seir, Hazor, Bozra, Edom, and other contiguous places, are noticed in the *xv*th and *xvii*th Isaiah, *xlvi*th and *xxix*th Jeremiah, *xxv*th and *xxxv*th Ezekiel. The march of Cambyzes through the desert (*xxi*st Isaiah, 13—17.) is commemorated as by an eye-witness and companion.

If any specific purpose invited the composition of the *xxxviii*th and *xxxix*th chapters of Ezekiel, it was probably that of inflaming, by the recital of former conflicts, the passions of such Jewish recruits as were to join Cyrus against the Scythians. A newly conquered country, from the diminished means of maintenance, has always afforded numerous levies to the conqueror; and such troops are studiously employed at a distance from their original frontier.

The encampment before Tyre seems to have lasted during the whole war, and eventually to have become rather a bazar than a blockade. It was resorted to by the Persians for the sale of captives (*Joel*, *iii*. 6.), and for the purchase of military stores (*Thalia*, 19.), and was employed to compel the co-operation of Ethbaal, then king of Tyre (*Philostratus*, as quoted by *Josephus*, *Ant. x*. 11.) in various undertakings of Cambyzes. To this intima-

tory siege allude the xxvth and xxviii Ezekiel, the xxxiii Isaiah, and the xxviii of Ezekiel.

To the march through Gaza, Ashkelon, and other towns of the Philistines, apply the xxvth Ezekiel, v. 15, &c. and the xlviii Jeremiah.

The xixth and xviii Isaiah, the xxixth and xxxth, and the xxxiii Ezekiel, and the xlvth Jeremiah, v. 14—26, concern the war in Egypt and Æthiopia: these poems, like the lamentation for Tyre, must have preceded the historical catastrophe, as they vary from the real event.

The xxxist Ezekiel is evidently an elegy on the death of Cyrus, defeated and killed by the Massagetæ (Clio, 214.): the 11th and 12th verses are very appropriate: and the whole poem is solemn, sublime, and worthy of the majesty of its hero.

On the death of Cyrus, one Smerdis, or Mardys, or Merodach, assumed the empire, while Cambyzes hastened homewards to claim it. The conspirators in the interest of Darius probably dispatched both these princes; Cambyzes at some obscure place, where he was said to have killed himself accidentally (Thalia, 64.); and Merodach later (Thalia, 70.) at Susa.

The xlvth Isaiah is another elegy, and on the decease of Cambyzes, to whose death and burial, in a foreign land, the 20th verse alludes. It must have been written during the supremacy of Merodach; as the 17th verse contains an indirect praise of the liberation of Jehoiakim (Jeremiah, lvi. 31.). This ode is superlatively grand.

The Babylonians, instigated by the idolatrous priesthood, as may be inferred from the eventual massacre of that order (Thalia, 79.), determined to defend their city against Darius, in behalf of Balthazar, a minor son of the prince (Baruch, i. 11.) who had brought Daniel out of Palestine. This young sovereign was soon besieged by Darius in his metropolis: and, the city having been taken after nineteen months investiture (Thalia, 152.), the king was thrust through in the streets.

To these events appertain the xlii

and xlviii Isaiah, and the 1st and 21st Jeremiah.

Darius, after the capture, rased the fortifications of Babylon (Thalia, 159.) which had been spared by Cyrus, and augmented by Cambyzes (Berosus, as quoted by Josephus, Ant. x. 11.). This circumstance is accordingly specified (Jeremiah, li. 44.) by the Hebrew bard. The expulsion of supernumerary women is another peculiarity of this siege of Babylon by the son of Hystaspes; and it is noted by the Hebrew (Isaiah, xlvii. 9.), as well as by the Greek (Thalia, 150.) authorities. Inattentive to these two discriminating marks, some commentators have erroneously supposed that a prior siege of Babylon by Cyrus is referred to in these poems.

In the capture of Nineveh, as well as of Babylon, Daniel must have taken an interest which, in other similar instances, made him endeavour to immortalize the event in song. There are no historical traces of such a prophet as Nahum. There is an allusion in this oracle (Nahum, iii. 8.) to a passage in the xlvth Jeremiah (v. 25.), which indicates identity of authorship. The internal evidence of style, manner, power of mind, also favour the ascription of this vision of consolation to Daniel.

Suppose the poems here enumerated to have been separated from the other scriptures on grounds sufficiently convincing, they will be found to contain poetry of superior quality. This Daniel would be far the greatest of the Hebrew bards, and worthy to have his odes inscribed on the walls of the palace of Persepolis. Nor is it unlikely that the decyphers of the arrow head characters there engraven are actually making an addition to the circulating mass of his productions. Education and intellect of that high order, which distinguish Daniel, were too rare in the times of Darius, to allow much range of choice in the selection of his panegyrist.

Enough, we trust, has been said to prove that the book, commonly attributed to Daniel, may with more probability be ranked among those which were composed about or after the times of the Maccabees, than among the older scriptures of the Jews.

The following passage, which we shall quote as one of the more remarkable instances of variation between the two texts here edited, will furnish our readers with the opportunity of comparison.

From the Daniel KATA TON ΘΕΟΔΩΤΙΩΝΑ, ΚΕΦ. ΙΙΙ. 23—33.

“23. Καὶ οἱ τρεῖς ἄνθρωποι, Σεδραχ, Μισαχ, καὶ Ἀβδανγίου, ἔστησαν εἰς μέσων τῆς

From the Daniel KATA ΔΟΥΚΕ Σ', ΚΕΦ. ΙΙΙ. 23—33.

“23. Τους μὲν ἄνδρας, τους συνποδιστάς τῆς περὶ τὸν Ἀζαρίας, ἐξέλευσεν

καμινῶν τῆς καίμενης πεπεδημένοι, καὶ περιπατοῦντες ἐν μέσῳ τῆς φλογος, ὑμνοῦντες τῷ Θεῷ, καὶ εὐλογῶντες τὸν Κυρίῳν. 24. Καὶ Ναβουχοδονοσορ ᾤκτισεν ὑψωντῶν αὐτῶν, καὶ ἰδαυμασε, καὶ ἔξεναγες ἐν σπουδῇ καὶ ἔπε τοῖς μεγίσταις αὐτῶν, οὐχὶ ἄνδρας τρεῖς ἔβαλομεν εἰς τὸ μέσον τῆς πυρός πεπεδημένους; καὶ ἐπὶ τῶν βασιλεῖς, ἀληθῶς βασιλεῦ. 25. Καὶ εἶπεν ὁ βασιλεὺς, ὁ δὲ ἔγω ὅρα ἄνδρας τεσσαρας λελυμένους, καὶ περιπατοῦντας ἐν μέσῳ τοῦ πυρός, καὶ διαφύλακται ἐκ ἐστίν ἐν αὐτοῖς, καὶ ἡ ὅρασις τῆς τεταρτῆς ὁμοία υἱῷ Θεοῦ. 26. Τότε προσήλθε Ναβουχοδονοσορ πρὸς τὴν θύραν τῆς καμινῶς τῆς καίμενης, καὶ εἶπε, Σεδραχ, Μισαχ, Ἀβδεναγῶ, οἱ ὅλοι τῷ Θεῷ τῷ ὑψίστῳ, ἐξέλθετε καὶ δευτε' καὶ ἐξήλθον Σεδραχ, Μισαχ, Ἀβδεναγῶ, ἐκ μέσου τῆς πυρός. 27. Καὶ συναγόνται οἱ σατραπαὶ, καὶ οἱ στρατιῶται, καὶ οἱ τοπαρχαὶ, καὶ οἱ ὄντας τῷ βασιλεῖ, καὶ ἔδωκον αὐτοῖς ἄνδρας, ὅτι ἐκ ἐκύριευσεν τὸ πῦρ τοῦ σώματος αὐτῶν, καὶ ἡ ὄριξ τῆς κεφαλῆς αὐτῶν ἐκ ἐρλογισθῆ, καὶ τὰ σαραβαρα αὐτῶν ἐκ ἡλλωσθῆ, καὶ ὁ σμῆ πυρός ἐκ τῆς ἐν αὐτοῖς. 28. Τὸ λαλῶν δὲ Ναβουχοδονοσορ ὁ βασιλεὺς εἶπεν, εὐλογητός ὁ Θεὸς τῷ Σεδραχ, Μισαχ, Ἀβδεναγῶ, ὃς ἀπέσειλε τῷ ἁγίῳ αὐτῶν, καὶ ἐξείλατο τῆς παιδῶν αὐτῶν, ὅτι ἐπεποιδεύσαν ἐπ' αὐτῶν καὶ τὸ ῥῆμα τῷ βασιλεῖ ἡλλωσάν, καὶ παρέδωκεν τὰ σωματὰ αὐτῶν εἰς πῦρ, ὅπως μὴ λατρεύσῃς μὴδὲ προσκυνήσῃς παντὶ θεῷ ἄλλ' ἢ τῷ Θεῷ αὐτῶν. 29. Καὶ ἐγὼ ἐκτιθέμαι τὸ δόγμα· πᾶς λαός, φυλὴ, γλῶσσαι, ἡ ἑστὴ βλασφημία κατὰ τὸ Θεὸν Σεδραχ, Μισαχ, Ἀβδεναγῶ, εἰς ἀπωλείαν ἐσθῆται, καὶ οἱ οἰκοὶ αὐτῶν εἰς διαρπαγὴν, καδοὶ οὐκ εἰς Θεὸς ἕτερος, ὅστις δυνήσεται ῥύσασθαι ἑαυτῶν. 30. Τότε ὁ βασιλεὺς κατεπόνη τὸν Σεδραχ, Μισαχ, Ἀβδεναγῶ, ἐν τῇ χώρᾳ Βαβυλωνος, καὶ ἠξήσαν αὐτῶν, καὶ ἤκουσαν αὐτῶν ἡγείσθαι πάντων τῶν ἰσχυρῶν, τῶν ἐν τῇ βασιλείᾳ αὐτῶν. 31. Ναβουχοδονοσορ ὁ βασιλεὺς πᾶσι τοῖς λαοῖς, φυλαῖς, καὶ γλῶσσαις, τοῖς οἰκοῦσιν ἐν πόλει τῇ γῇ, εἰρητῇ ὑμῖν, πληθύνειν. 32. Τα σμῆματα καὶ τὰ τεράτα, ἃ ἐποίησε μετ' ἐμῷ ὁ Θεὸς ὁ ὑψίστος, ἤρρεσαν ἐναντίον ἐμῷ ἀναγείλαι ὑμῖν, 33. Ὡς μεγάλα καὶ ἰσχυρὰ ἡ βασιλεία αὐτοῦ, βασιλεία αἰωνία, καὶ ἡ ἐξουσία αὐτῶν εἰς γενεὰν καὶ γενεάν.

ἡ φλογὶς ἐκ τῆς καμινῶς ἐνεπύρισε καὶ ἀπέκτεινεν αὐτοὶ δὲ συνετηρήθησαν. 24. Καὶ ἐγένετο ἐν τῷ ἄκμασι τὸν βασιλεῖα ὑμνωντων αὐτῶν, καὶ ἐς τὴν ἔθεωρει αὐτοὺς ζῶντας. τότε Ναβουχοδονοσορ ὁ βασιλεὺς ἰδαυμασε, καὶ ἀνέστη σπεύσας, καὶ εἶπεν τοῖς φίλοις αὐτοῦ, ὅρα ἄνδρας τρεῖς ἔβαλομεν εἰς μέσον τῆς πυρός πεπεδημένους; καὶ ἐπὶ τῶν βασιλεῖς, ἀληθῶς, βασιλεῦ. 25. Καὶ εἶπεν ὁ βασιλεὺς, ὁ δὲ ἔγω ὅρα ἄνδρας τεσσαρας λελυμένους περιπατοῦντας ἐν τῷ πυρὶ, καὶ φθῆρα ἑδεμία ἐγένεθη ἐν αὐτοῖς, καὶ ἡ ὅρασις τῆς τεταρτῆς ὁμοίωμα Ἀγγελοῦ Θεοῦ. 26. Καὶ προσελθὼν ὁ βασιλεὺς πρὸς τὴν θύραν τῆς καμινῶς καίμενης τῷ πυρὶ, ἐκάλειν αὐτοὺς ἐξ ὀνόματος, Σεδραχ, Μισαχ, Ἀβδεναγῶ, οἱ παῖδες τοῦ Θεοῦ τῶν θεῶν τῷ ὑψίστῳ, ἐξέλθετε ἐκ τῆς πυρός ἑταῖς ἐν ἐξήλθον οἱ ἄνδρες ἐκ μέσου τοῦ πυρός. 27. Καὶ συνηχθήσαν οἱ ὑπαῖοι, τοπαρχαὶ, καὶ ἀρχιερατῶνται, καὶ οἱ φίλοι τῷ βασιλεῖ, καὶ ἔδωκον τὴν ἀνδρωπὸς ἐκείνης, ὅτι ἐξ ἡψατο τὸ πῦρ τῶν σωματῶν αὐτῶν, καὶ αἱ τριχες αὐτῶν οὐ κατεκαύσαν, καὶ τὰ σαραβαρα αὐτῶν ἐκ ἡλλωσθῆσαν, ἔδε ὁ σμῆ τῆς πυρός ἦν ἐν αὐτοῖς. 28. Τὸ λαλῶν δὲ Ναβουχοδονοσορ ὁ βασιλεὺς εἶπεν, εὐλογητός Κυρίος τῷ Σεδραχ, Μισαχ, Ἀβδεναγῶ, ὃς ἀπέσειλε τὸν ἁγίον αὐτοῦ, καὶ ἔσωσε τῆς παιδῶν αὐτοῦ, τοὺς ἐλπίζοντας ἐπ' αὐτῶν τὴν γὰρ προσταγὴν τῷ βασιλεῖ ἡδετήσαν, καὶ παρέδωκεν τὰ σωματὰ αὐτῶν εἰς ἐμπύρισμα, ἵνα μὴ λατρεύσῃς μὴδὲ προσκυνήσῃς θεῷ ἑτέρῳ, ἀλλ' ἢ τῷ Θεῷ αὐτῶν. 29. Καὶ νῦν ἐγὼ κένη, ἵνα πάντες ἔδωκον, καὶ πᾶσαι φυλαὶ, καὶ πᾶσαι γλῶσσαι, ὅς ἐν βλασφημίᾳ εἰς τὸν Κύριον τὸν Θεόν Σεδραχ, Μισαχ, Ἀβδεναγῶ, διαμελισθῇσεται, καὶ ἡ οἰκία αὐτῶν θεμελιωθῇσεται, διότι οὐκ εἰς Θεὸς ἕτερος, ὃς δυνήσεται ἐξελῆσθαι ἑαυτοῦ. 30. Οὕτως ἐν βασιλείᾳ τῷ Σεδραχ, Μισαχ, Ἀβδεναγῶ, ἐξουσίαν δὲς ἐπ' ὅλης τῆς χώρας, κατεστῆσαν αὐτοῖς ἀρχόντας. 31. Ἀρχὴ τῆς ἑπιστολῆς· Ναβουχοδονοσορ ὁ βασιλεὺς πᾶσι τοῖς λαοῖς, φυλαῖς, καὶ γλῶσσαις, τοῖς οἰκοῦσιν ἐν πόλει τῇ γῇ, εἰρητῇ ὑμῖν πληθύνειν. 32. Τα σμῆματα καὶ τὰ τεράτα, ἃ ἐποίησε μετ' ἐμῷ ὁ Θεὸς ὁ ὑψίστος, ἤρρεσαν ἐναντίον μου ἀναγείλαι ὑμῖν, 33. Ὡς μεγάλα καὶ ἰσχυρὰ ὡς μεγάλη καὶ ἰσχυρὰ ἡ βασιλεία αὐτοῦ, ἡ βασιλεία αὐτοῦ, βασιλεία αἰωνίως, ἡ ἐξουσία αὐτοῦ εἰς γενεὰν καὶ γενεάν.

Verbal critics and exegetic virtuosos will do well to consult further the Daniel secundum ΔΕΚ ex tetrapihis Grigenis Romæ, anno 1772, ex Christiano codice primæ editionis, augmentatæ per Vanderhoeck

at Gottingen, in 1774, where there are, moreover, the apocryphal, or additional verses apparently intended to be set to music.

ART. II. *The Book of Job: metrically arranged according to the Masora, and newly translated into English; with Notes critical and explanatory: accompanied on the opposite Page by the authorized English Version. By the Right Reverend JOSEPH STOCK, D. D. Bishop of Killala and M. R. I. A. 4to. pp. 246.*

WE congratulated our readers in a former volume, that the learned bishop of Killala having been induced by his friend and relation archbishop Newcome to turn his attention to sacred criticism, had, after the death of that eminent scholar, entered upon the same walk of useful learning, which he had trodden so long and with so much honour and advantage; and prepared himself to add to those valuable translations which have proceeded from the labours of some of the brightest ornaments of our country. The first specimen of Dr. Stock's abilities as a translator has been—as it deserved, very favourably received. The version of Isaiah proved him an able successor of his venerated friend, and raised expectations, which we trust will be fully realized. We strongly recommended that work to the attention of biblical students—and a frequent use of it has confirmed the opinion of its merits which we at first formed, and without hesitation expressed. The work which now claims the notice of the public, though it be not destitute of considerable merit, is not equally free from imperfection. Many passages, obscure in the common English version, are here indeed elucidated—many beauties hitherto concealed are here brought to light—but dark passages still remain to perplex the reader, which are capable of being illuminated—and many alterations are introduced which have far less excellence than the passages for which they are substituted. This has arisen in part from the difficulties with which, owing to various causes, the book of Job abounds—in part also—though the right reverend translator will not perhaps, upon his hypothesis allow it, from his not having had recourse to the literature of Arabia; and in part, we fear, in no small part, from the haste, together with the afflictive circumstances, in which this version appears to have been made.

That the translation of the book of Job is no easy task, has been admitted on all hands.—“*Multa sunt loca valde obscura, multa quæ verè ut quisquam mortalium satius intelligat;*” was the complaint of Lowth: and Dr. Stock has himself enumerated some causes which contributed to the incorrectness of the old English version, and which not being yet removed,

must produce their effect upon a modern translation.

That a translator and interpreter of the book of Job should be well versed in other languages of the east, besides the Hebrew—that he should be a proficient in Arabic—and deeply read in the numerous and rich effusions of the Arabian muse—we think cannot reasonably be doubted. When it is considered that to whatever period the date of this beautiful composition be referred—the scene of this poem is laid in Idumæa—and that some of its most difficult as well as its most beautiful passages are distinguished by their allusions to the natural history, or to the manners and customs of that region. The style, we allow, is pure Hebrew, yet many unusual words occur in this work, and oppose very serious obstacles to the progress of the interpreter: and if other parts of the Old Testament, known to be composed by native Jews, and at a late period of their monarchy, often receive considerable illustration from the Arabic tongue, much more must the book of Job. We have reason to believe that this language is unknown to the bishop of Killala; and this we consider as one cause of some passages being left as obscure, and as unintelligible as he found them.

Knowing the book to be the most difficult in the Jewish canon, and himself destitute of one source from which German critics especially, have very copiously and very successfully drawn in their versions, and in their illustrations of the writings of the Old Testament, it ought not, most assuredly, to have formed any part of the learned prelate's ambition, that a work of this nature had been completed in a short time; and in the midst of afflictions which might well have rendered him incapable of the cool and laborious investigation required in such an employment. It was therefore with mingled emotions of surprize and grief that we perused the following passage, with which the admirable analysis of the poem concludes.

“This (viz. a confident expectation that the government of God will be vindicated in a future scene) is the important lesson to be learned from the book of Job. Till man arrives at that blessed place, where he shall

know even as he is known, let him lay his hand upon his mouth, and humbly acknowledge his incapacity to judge of the dispensations of the righteous governor of the world. All will end well at the last with him that loves his God, and trusts in him.

"Reader, I believe so. I am assured of it; although I also have shared in the miseries of mortality, and am at this very moment pierced through with sorrow. A few days before I prescribed to myself the task of translating Job, a disease of the most excruciating kind fell on a beloved consort, my most faithful companion through toil and peril for the space of twenty-seven years. While I proceeded, not her dissolution only swam before my eyes: pain, the extremity of pain, which I would most gladly have bought off by my own suffering, drew from the most patient of human creatures accents of woe, which I hear now, and will speak no more of them. It was a business of six weeks. The last line of this translation was tracing while they carried her to her grave.*

"My God, it is thy doing! I will lay this good book to my heart, and be still."

P. 243, 244.

Under such circumstances, and in so short a portion of time, a work of this nature could not be properly performed. We are astonished indeed that it was performed at all; and more astonished still that it has the merit which we very gladly ascribe to it: but the cause of sacred criticism would have been better served, and the reputation of the learned prelate would have been greatly increased, had he been content, in that season of affliction, with deriving from the original work the consolation he has found in it; deferred the translation to a season in which his mind could have been free from the perturbation under which it must have laboured; and apportioned more equally the time employed to the difficulty and importance of the undertaking.

*In the preface Dr. Stock attempts, we think without success, to settle the time at which this extraordinary poem was written. He observes, p. v, vi.

"The sacred critics in general have been apt to ascribe to the book of Job an origin that loses itself in the shades of antiquity. The opinion, I believe, rested at first on the very sandy foundation of what is stated in the two concluding verses of the work, which ascribe to its hero a longevity that belonged only to the generations not far distant from the flood. Of the authenticity of those verses I think I have shewn in my note on them that we have every reason to be suspicious.

"But if it were ever so difficult to ascertain the portion of time when the patriarch lived, it may not be impossible, from internal marks in the poem itself, to conjecture with tolerable certainty the era of its author. This is what I have attempted to execute. The subject is curious; and on a close inspection of the work before us, certain notes of time have presented themselves to my observation, which appear to have escaped the diligence of all preceding critics. The reader will allow me to offer them to him here in a summary manner, referring him for further satisfaction on the point to what I have said in the notes.

"Allusions to events recorded in five books of Moses are to be found in this poem, Ch. xx. 20, compared with Numb. xi. 33, 34. Ch. xxvi. 5, compared with Gen. vi. 4, 7, 19. Ch. xxxiv. 20, compared with Exod. xii. 10. Ch. xxxi. 33, compared with Gen. iii. 8, 12; and I shall hardly be expected to prove, that the author of the poem derived his knowledge of those events from a history of so much notoriety as that of Moses, rather than from oral or any other tradition. Facts are not usually referred to, before the history recording them has had time to obtain currency. The inference is clear: the writer of the book of Job was junior to the Jewish legislator, and junior it is likely by some time.

"A similar mode of reasoning upon comparison of Ch. xxxiii. 23, with 2 Sam. xxiv. 16; 1 Chron. xxi. 15, will, if I mistake not greatly, bring down the date of our poem below the time of king David.

"Lastly, Ch. xii. 17, to the end, seems to point to the circumstances preceding and attending the Babylonish captivity: and Ch. xxxvi. 8—12, has an appearance of alluding to the various fortunes of Jehoiachin king of Judah, 2 Kings xxiv. 12. xxv. 27; notes of time these, which, though not so manifest as the fore-mentioned, may deserve attention; since they add strength to the sentiment of those learned men, who have been inclined to give the honour of this celebrated composition to Ezra."

If our readers will give themselves the trouble to compare the above-mentioned passages, they will undoubtedly be convinced that in this attempt to ascertain the era of the author of this book, Dr. Stock has not been successful. The first of these passages derives all the little efficacy it may possess, from a variation in the version which comes not with sufficient authority. He who has not access to Dr. Stock's translation, cannot judge of the importance of this passage in this enquiry. For "surely he shall not feel quietness in his belly, he shall not save of that which he desired," Dr. Stock reads, "Because he acknowledged not the quail in his sto-

* Mrs. Catharine Stock died May 5, 1805, in the 55th year of her age: she has left behind her fifteen children.

mach, in the midst of his delight he shall not escape." The old version is more suitable to the context, and would not perhaps have been altered by the right reverend translator, had not the ambiguous word *לר* afforded a plausible opportunity of supporting an hypothesis. The next chapter, which is thought to contain an allusion to the deluge, rests upon no surer foundation. In Ch. xxxiv. 20, there is very probably a reference to the death of the first-born in Egypt, and in Ch. xxxi. the transgression of Adam is expressly mentioned. But such facts as these—the former of which, it is probable, had but recently happened, might be the subject of oral information only. The story of Adam, we have every reason to believe, was a common tradition; and so striking an event as the sudden destruction of the first-born, could scarcely fail of being soon communicated to the neighbouring people, and amongst those who were not idolaters must have been remarked and cited as an evidence of the power and the moral government of God.

Of the allusions to the destroying and the interceding angels in the time of David, and to the events attending the Babylonish captivity, Dr. Stock himself does not appear perfectly convinced; and no one will find them in the passages to which he has referred, who has not an hypothesis to propose or to support. It is in point here to observe that the former of these was regarded by Warburton, whose object also it was to bring the date of this book as far down as possible, as "a most circumstantial account of God's dealing with Hezekiah." The question, therefore, respecting the date of this singular and beautiful production, is not yet settled. One thing we apprehend must be regarded as certain—that if it had been of the age of Ezra, there would have been no occasion to explore the poem so minutely, or to alter the version of ambiguous words in order to find references to the Jewish history: these must have been interwoven with the whole piece, and given a strong and decided colouring to the poem.

Two of the sources, whence the Hebrew poets drew their most striking and

beautiful imagery, were, the sacred rites of their religious worship, and the surprising occurrences in their eventful history. Images derived from these abound in the odes of David, and in the effusions of the prophets. It is therefore scarcely credible, that a long and ornamented poem, in which so few of these images can be discovered even by the microscopic eye of a framer of hypotheses; was composed a considerable time after these rites were established, and these occurrences recorded by the pen of the historian.

But it is time to proceed to the examination of the learned translator's labours. In carefully collating this version with that in general use, we have found nearly five hundred variations, of which more than four hundred and thirty are marked with an asterisk, to denote that they 'depart materially from our common English translation.' Of these variations many are very judicious, others are needless; some are very faulty, blemishes rather than improvements. As a fair specimen of the work we present our readers with the following version of the xxxviii. chapter.

" CHAPTER XXXVIII.

" 1. Then Jehovah answered Job out of the whirlwind and said:

2. Who is this that darkeneth wisdom by words,

* *This man* without knowledge?

3. Gird up now, like a man, thy loins,
For I will question thee, and inform thou me,

4. Where wast thou when I founded the earth?

Tell, if thou knowest *what* is understanding.

5. Who fixed the measures thereof, if thou knowest?

Or who stretched the line upon it?

6. Upon what are the bases thereof rested,
Or who laid the corner stone thereof?

7. When the morning stars sung together,
And all the sons of God shouted for joy.

8. Or who shut up with doors the sea,
When it brake forth, *as if* it issued from a womb?

9. When I made the cloud the garment thereof,

And thick darkness its swaddling-band,

10. *When I fixed over it my decree,
And set bars and doors,

2. *This man.*] I follow the masoret distinction of the lines.

6. *The bases thereof.*] Its *cussons*, upon what are they *sunk*?

10. *I fixed.*] Heb. *I brake short*, fixed it decidedly and briefly. גורתי is the Chaldee version. Had we authority of MSS. I should have preferred ואשכל and *I impelled against it my decree*. See the verb in Parkhurst. Being of rare occurrence, it might have been changed by transcribers for a word more common.

11. And said, hitherto shalt thou come, but no further,
And here shall thy proud waves be stayed.
12. *Hast thou out of thy seas commanded the morning?
*Hast thou known the dawn, since it was appointed?
13. That it might lay hold of the edges of the earth,
*And the flashes be set in motion from her?
14. *She changeth her appearance, as clay from the seal,
*And they present themselves like a person full-dressed:
15. *And from the flashes their light is withdrawn,
And the high-raised arm is broken.
16. Hast thou entered into the mazes of the sea?
Or in the inmost recess of the deep hast thou walked?
17. Have the gates of death been revealed to thee,
And the gates of the shadow of death hast thou seen?
18. *Doth thy understanding extend to the wide stretchings of the earth?
Tell, if thou knowest it all.
19. Where is the road to where light dwelleth?
And darkness, where is the place thereof?
20. Seeing thou canst conduct us to its border,
And seeing thou art acquainted with the paths to its house.
21. *Thou must know, because thou wert born at the time,
And in number thy days are many.
22. Hast thou entered into the treasures of the snow,
And the treasures of the hail hast thou seen,
23. Which I reserve against the time of distress,
Against the day of combat and war?
24. Where is the way to where lightning is strewn out?
To whence the east wind is let loose upon the earth?
25. Who hath laid out for the flood its channel,
And a way for the forked bolt of thunder,
26. To cause rain on the earth where no man is,
On the wilderness where mortal is not;
27. To satisfy the desolate and waste ground;
To cause the issue of the grass to spring?
28. Hath the rain a father?
Or who hath begotten the round drops of the dew?
29. Out of whose womb came the ice?
And the hoar frost of heaven, who hath gendered it?
30. As with stone, do the waters cover themselves,
*And the face of the deep is taken prisoner.

11. *Be stayed.*] Heb. *shall one put a stop to*; verb imper.

12. *The dawn.*] Joining *השחר*, as in many copies. *מִקְוֶר*, since it was established, for the purposes mentioned in the next verse.

Ibid. Out of the seas.] From whose bosom the first streaks of light seem to take their rise. To prevent the equivocal of *מִיָּם* which may signify either from thy days or from thy seas, two copies have the word *מִיָּם*, from thy sea in the singular number; but it is not necessary to write so, since the context explains the sense.

13. *And the flashes.*] Vulg. *רשעים*, of the authenticity of which word it should seem that many copyists had a doubt by writing the *ע* in a position elevated above the level of the other letters, and that twice over in the same verse. In place of this intruder we should substitute the letter *פ*, and make the *רשעים*, which denotes *flashes of lightning*, coruscations, as in Ps. lxxviii. 48. The whole passage will then become both consistent with itself, and elegant. The flashes, or first streaks of day-light, are described as presenting themselves to view in the gay dress of a courtier going to wait on his sovereign; while the earth, whose edges are illuminated by them, changes her appearances, as the clay (the eastern substitute for sealing-wax) takes different forms according to the seal: the splendour of these flashes is diminished by the superior lustre of the planet of day advancing in his course, till by degrees the high raised arm (or the projected arm) *זרוע רמת* (the arm of shooting) which was stretched across the heaven, is broken off. Of the justice of this picture of the sky in a fine morning every reader must be a judge, who has accustomed himself to the laudable practice of early rising.

16. *The mazes.*] From *בִּךְ* to be perplexed comes the name, implying meanders, intricate passages into the abyss.—*Scott. Parkh.* *תִּקְוֶר* is the penetrale of the ocean. *Parkh.*

20, 21. Contain a lofty irony.—*Scott.*

24. *Lightning.*] So we should render *אור* here, as in chap. xxxvii. v. 3, on account of its accompaniments—wind, rain, and thunder.—*Scott.*

31. *Canst thou bind up the delights of warmth,
*Or the flakes of cold canst thou set loose?
32. *Canst thou bring forth the blight in its season,
*And comfort corrosion over her sons?
33. Knowest thou the statutes for heaven,
*Canst thou lay down regulations for the earth?
34. Canst thou lift up to the clouds thy voice,
That a deluge of waters may cover thee?
35. Canst thou dispatch the lightnings, that they may go,
And may say unto thee, here we are!
36. Who hath settled in the inward parts wisdom?
Or who hath given to the imagination discernment?
37. Who shall number the warring clouds by wisdom?
*And the pitcher of heaven who shall stoop?
38. When the dust fixeth into hardness,
And the clods stick close together?
39. Wilt thou hunt down for the lioness her prey?
And with animal flesh wilt thou stuff the young lions?
40. When they couch in their dens,
*When they abide in the covert, their place of ambush?
41. Who layeth out for the raven his provision,
When his young ones caw unto God,
*When they are straying to where there is no food?

All the corrections which the common version has received from the hand of Dr. S. are not equally judicious. Impartiality requires that we select a few to exemplify this remark.

Old Version—"For now it would be heavier than the sand of the sea: therefore my words are swallowed up." Chap. vi. v. 3.

31. *The delights.*] A pleasurable sensation of warmth.—*Parkh.* The flakes of cold are the *spicula* of frost, which penetrate the skin.

32. *Comfort corrosion.*] A beautiful poetical image. Canst thou make amends to the destructive blast for the loss of the numerous tribe of insects, to which she gave birth last season, and which were swept away as quickly as they came, by giving her the opportunity of producing as many more? For מורית see above. Chap. xxxvii. verse 2.

33. *Regulations.*] For משטרו read with one MS. משטרות. The common reading affords no antecedent to משטרו but שמים, the plural to the singular.

34. *May cover thee.*] May form, as it were, a pavilion for the lord of thunder.—*Scott.*

36. *Discernment.*] To count the conflicting elements as *Parkh.* expounds שדקים.

37. *Who shall stoop.*] To discharge their contents upon the earth. This image is similar to the inclined urn, which the heathen poets place in the hand of a river-god. *Scott* from *Schultens.*

38. *When the dust.*] When rain is most wanted to mollify the glebe, hardened by drought.

Dr. Stock—"For now beyond the sand of the sea it would be heavy;

Therefore my words are swallowed up."

O. V.—"Canst thou by searching find out God? canst thou find out the Almighty unto perfection?

"It is as high as heaven; what canst thou do? deeper than hell; what canst thou know?" Chap. xi. v. 7-8.

Dr. S.—"Canst thou by searching find out God?

Unto perfection canst thou find out the Almighty?

See the heights of heaven, what canst thou do?

See a deep below hell, what canst thou know?"

O. V.—"If I wait, the grave is mine house: I have made my bed in the darkness.

"I have said to corruption, *Thou art my father*; to the worm, *Thou art my mother and my sister.*" Chap. xvii. v. 13-14.

Dr. S.—"Though I tarry, the grave is mine house,

In darkness must I seek my mattress:

To the pit must I say, my father art thou;

My mother and my sister I must call the worm."

O. V.—"Behold, I cry out of wrong, but I am not heard: I cry aloud, but there is no judgement." Chap. xix. v. 7.

Dr. S.—"Lo, I may cry murder! but have no answer;

I may roar, but there is no justice."

O. V.—"The lion's whelps have not trodden it, nor the fierce lion passed by it.

"He putteth forth his hand upon the rock; he overturneth the mountains by the roots." Chap. xxviii. v. 8-9.

Dr. S.—"The sons of the splitter tread it not,

Neither passeth over it the jackal.

Into the flint he thrusteth his hand,

He upturneth by the roots the mountains."

In a note upon this passage the translator observes, that the *splitter* signifies the lion:—Why then, we ask, has he

changed the old version for a synonymous expression, harsh and unpleasant, and requiring a marginal illustration? This is no proof either of taste or judgement.

O. F.—“ I am a brother to dragons and a companion to owls.” Chap. xxx. v. 29.

Dr. S.—“ A brother am I to dragons, And a companion to the daughters of screeching.”

We cite this instance as one amongst many others that might be adduced to justify the censure we have passed upon the hasty manner in which this version has been prepared. *Daughters of screeching* is a literal translation of the original poetical phrase בנות יענה, and might properly enough be substituted for *owls*, but in a short note Dr. S. informs us that it is ‘ a common epithet for *ostriches*.’ In his haste he has unfortunately forgotten that in his translation of Isaiah, chap. xiii. v. 21, he has rendered the very same phrase by *screech-owls*, and, upon the authority of that excellent critic Rosenmüller, asserted that it cannot mean *ostriches*.

All the above alterations, and many more, we are sorry to say, might be added, are needless; and some of them betray a total want of discrimination and taste. We subjoin a few yet more reprehensible, in which the correction is not only needless but absolutely faulty.

O. F.—“ He is wise in heart, and mighty in strength: who hath hardened himself against him, and hath prospered?” Chap. ix. v. 4.

Dr. S.—“ Wise in heart as he is, and mighty in strength, Who shall play the sturdy with him and prosper?”

O. F.—“ He will not suffer me to take my breath, but filleth me with bitterness.” *Ibid.* v. 18.

Dr. S.—“ He giveth no respite to my breath, Though he stuffeth me with bitterness.”

O. F.—“ If I say I will forget my complaint, I will leave off my heaviness and comfort myself.” *Ibid.* v. 27.

Dr. S.—“ If I say I will forget my sad thought, I will leave my *wry* faces, and wear a smile.”

O. F.—“ Turn from him that he may rest till he shall accomplish, as an hireling, his day.” Chap. xiv. v. 6.

Dr. S.—“ Look away from him and let him decay Till he has run through, as an hireling, his day.”

What ear is not offended by this miserable jingle? What cause of boasting is there here, that this translation was a work of six weeks?

O. F.—“ With us are both the gray headed and very aged men, much elder than thy father.” Chap. xv. v. 10.

Dr. S.—“ The gray head and the chrony are with us, The plenteous, more than thy father in days.”

O. F.—“ Whereas our substance is not cut down, but the remnant of them the fire consumeth.” Chap. xxii. v. 20.

Dr. S.—“ As surely as our estate shall not be carried away, So on their savings shall the fire prey.”

O. F.—“ The east wind carrieth him away, and he departeth.” Chap. xxvii. v. 21.

Dr. S.—“ The east wind uplifteth him and he is off.”

O. F.—“ Her young ones also suck up blood.” Chap. xxxix. v. 30.

Dr. S.—“ And her young ones gobble up blood.”

It is no pleasant task to point out such gross violations of propriety and of good taste as these, and we are sorry to observe that the list might have been made more extensive. Our object has been, to induce the learned prelate to be more cautious in any future work of this nature; and to re-peruse before he favours the world with a translation of any other portion of scripture, those excellent rules which his great predecessor laid down in his admirable ‘ historical view, &c.’ and to which he himself so faithfully and judiciously adhered. It is with interpreters in general, as with annotators; they never know when to stop, but appear to estimate the value of their version by the quantity rather than the quality of their corrections. We recollect scarcely a single translator, who has not, without any reason, altered elegant and harmonious passages in the common English version, and utterly destroyed all sweetness of sound, without improving the sense.

Our readers may perhaps be curious to know the opinion of the bishop of Killala concerning the much controverted passage chap. xix. v. 25-26. If we had not already extended this article to a more than usual length, we would transcribe the note upon those verses. We can do no more than state that Dr. S. rejects the opinion of Peters and others, that the language of Job had a reference to a general resurrection to eternal life, and considers it as expressing a full ‘ expectation of returning from the grave at some future period, to see his own innocence vindicated, and his calumniators punished.’

Many short but useful notes accompany this version, yet their number might

with great advantage, have been much increased. Every book should be as complete as possible in itself. This is a maxim which has been often recommended, and no author should be unmindful of it. The obscure passages, of which almost every reader of this version will wish for an elucidation, may be explained by Heath or Scott, but these valuable works are not in every reader's possession.

We must not omit to mention that in this work several conjectural emendations by Dr. S. occur, in general very judicious and happily throwing light upon difficult passages. One of these has been already placed before our readers in the extract we have made. Of the rest the following are the most satisfactory: chap. vi. v. 7, **כדרי** for **כדרי**; chap. xv. ver. 22, **וצפורה** for **וצפורה**; verse 29, **מבלים** for **מגלים**; chap. xx. verse 7, **בגילו** for **בגילו**; chap. xxx. verse 2, **אבר** for **אבר**; verse 24, **להן** for **להן**; chap. xxxvii. **ברי** for **ברי**. This part of the learned translator's labours might have been extended; and the emendations of many eminent critics, now widely scattered, might have been collected, and, in many instances, advantageously introduced.

The translation of Isaiah by Dr. Stock was accompanied by the Hebrew, and we are sorry that the same plan has not

been adopted in this version of Job. 'The Hebrew original,' observes the author, 'I have not been at the pains to annex to the present work, because the critics seem to have given me no thanks for my labour in publishing Isaiah with points; and I work for ordinary scholars, like myself, who do not hope to understand Hebrew very well, without the assistance of those reprobated points.' Pref. p. viii. We are perhaps among those to whom the learned author here refers. We ventured to express our disapprobation of the points that accompanied the original of Isaiah, but we are truly concerned and surprized, that, because the points were reprobated, the Hebrew text has been in the present publication withheld.— Though we do not lay the same stress upon these barbarous inventions that the bishop of Killala does, yet we should have been glad to have seen the original text even with the incumbrance of the masoretic commentary.

We now take leave of this version of a very curious and important book of scripture, after having endeavoured to give a full and an impartial account of it. We are happy to express our approbation of the greater part of the corrections which the common version has here received; but we regret that it is not so perfect as it would have been had the author bestowed upon it a larger share of uninterrupted attention.

SACRED CRITICISM.

ART. III.—*A F indication of certain Passages in the common English Version of the New Testament; addressed to Granville Sharp, Esq. Author of the "Remarks on the Uses of the Definitive Article in the Greek Text of the New Testament."* By the REV. CALVIN WINSTANLEY, A. M. 12mo. pp. 84.

OUR readers, we apprehend, cannot have been inattentive to the progress of the enquiry to which this excellent little tract relates, and which we hope it has brought to a conclusion. In the year 1797, there appeared, in the second part of a learned occasional work, entitled '*Museum Oroniense*,' a paper written by Mr. Granville Sharp, and intended to exhibit an argument in favour of the divinity of Christ, deduced from the Greek definite article, and the copulative conjunction. In the midst of erudite criticisms, not generally regarded as important, it might have remained known only to a few scholars who have access to that work, had not the present bishop of St. David's, in the year 1798, urged by his great zeal for the orthodox faith, republished it in a pompous and illiberal manner, subjoining a table of

Evidences of Christ's Divinity, by Dr. Whitby; a table not to be found in his LAST THOUGHTS, as Dr. Burgess well knew, though he had not the candour to acknowledge it. In the course of the same year appeared six letters addressed to Mr. Granville Sharp by Mr. Wadsworth, it was said, of Cambridge, intended to form a supplement to the '*Remarks*,' and to corroborate the species of evidence which had been exhibited in them, by numerous quotations from the fathers, especially the Greek fathers. In 1803, six more letters were addressed to Mr. Sharp by an anonymous author, of a very different character, and of very different views, who called himself *Gregory Blunt*. An account of this witty production was given in our second volume. His object was, *ridens dicere verum*; and

in this field of grammatical controversy he must be acknowledged to have used the weapons of ridicule with great skill and effect. Mr. Winstanley has entered last into the lists—a sober champion, cased in the armour of Grecian literature, and attacking his boastful antagonist with his own weapons. He has clearly proved that the first suspicions which arose in Mr. Wadsworth's mind are unjust: 'Surely,' said I, 'Mr. Sharp has only not gone so far in the investigation as earlier critics. There must be some secret fallacy; and he is producing to us, as a valuable discovery, that which his predecessors, after having for a time followed it, must have found out to be an empty phantom, and so they returned from their pursuit, and sat down again, not venturing to tell the world how idly they had been occupied.' See *Six Letters*, &c. page 2.

This secret fallacy, which escaped this last-mentioned author, has been detected

by Mr. Winstanley, and clearly brought to light. He examines, with care, the several rules which had been proposed by Mr. Sharp; he 'proves some to be defective, some fallacious, and others absolutely false.' It is impossible to give any satisfactory analysis of such a publication as this, or to select any passage that should do justice to the author or his subject: but we recommend it to the serious regard of those who, dazzled by 'the imposing light in which the 'Remarks' have been recommended to public attention," have been induced to give their approbation to canons of criticism which are at variance with the genius of the Greek language, which tend to deform and vitiate our English version of the Scriptures, and which 'exhibit the sacred penmen in unfavourable colours, irreconcilable with the uprightness and simplicity that characterise their writings.'

ART. IV.—*A concise and interesting View of the Objection of Mr. Gibbon, that our Lord foretold his second Coming in the Clouds of Heaven in the Generation in which he lived, which the Revolution of seventeen Centuries has proved not to be agreeable to Experience: chiefly intended as a Specimen of the true Method of ascertaining the genuine Meaning of the New Testament.* By N. NISBETT, M. A. Rector of Tunstal. 8vo. pp. 39.

THIS little tract, published in the form of a sermon, delivered, we are told in the preface, before the judges of assize at Maidstone in the year 1802, is an epitome of a very valuable work, reviewed by us in a former volume. The subject, it is well known to theological students, has occupied the author's attention for many years, 'from a steady conviction,' as he asserts, 'that it would not only furnish an unanswerable reply to Mr. Gibbon's objection concerning the coming of Christ; but that it would lead to a more accurate knowledge of the New Testament than has hitherto been acquired.'

As this subject does not relate to any speculative doctrine, but involves the in-

terests of our common christianity, we will venture to confess that, from the very day in which we read the first publications of this intelligent and zealous writer, we have been satisfied of the justness and high importance of the principles which he has been labouring to establish. We earnestly recommend this tract, but especially the publication to which we have before alluded, and of which this is only an outline, to the attention of those who are desirous of seeing an able illustration of many very striking passages of scripture, and a strong hold of infidelity swept away like the house erected on the sand.

ART. V.—*Brief and impartial View of the two Theories of the Fall of Man, by the Rct. P. INCHBALD.* 8vo.

THE author of the Wisdom says in the second chapter (v. 23 and 24), 'God created man to be immortal, and made him to be an image of his own eternity; nevertheless, through envy of the devil, came death into the world.' This is not only the scriptural, but the popular opinion concerning the fall. Milton, who was learned in theology, and who aspired to make his fables correspond with the received notions of the christian world, gives an analogous representation: ac-

cording to which, mortality is the hereditary corruption we owe to Adam, the imputed penalty, the unceasing consequence, of his conduct.

Mortality, if it be a misfortune, is however no sin. Vice is a departure from the laws of reason, crime from the laws of society, and sin from the laws of religion. To die is not an act of disobedience to God. The original sin of Adam, if it produced a mortal change in his nature, became, by that very change, thenceforth

incapable of repetition. It is no more possible to inherit a sin, than to inherit a fall from one's horse. A sin is an act of transgression, not a habit or a tendency. What we can and do inherit is the capability of sinning, the power of being stimulated by appetite, anger, vanity, and lust, to commit actions unfavourable to our own happiness, and to that of others. This capability of sinning is necessarily accompanied with a tendency to sin: for the original propensities of all animals are selfish: every creature naturally prefers itself to others: and such preference, in a case of collision, is sin. It is by experience and culture that those sympathies and forecasts are evolved, which purify our actions into virtue, by causing them to be performed with a view to the production of the greatest happiness, whether we ourselves are to partake it or no. As far as selfishness is sinful, and self-immolation virtuous, we inherit peccancy and acquire merit: we pass, as is technically said, from a state of nature to a state of grace. This regeneration of our ideal

associations is often brought about by the means of religious opinions; by insisting on the advantages which, in a future state, will attend the sacrifice of ourselves to others; by insisting on the miseries which, in a future state, will attend the preference of ourselves to others; thus making our very selfishness a motive to our benevolence. And thus *faith* may conquer the original hereditary selfish tendency, or pravity, of our nature, and ought in that case to be imputed to us as righteousness.

These observations being premised, we suspect it will be found more scriptural, and more rational, to incline toward the first, than toward the second theory of the fall here examined: although several of the phrases in use among the calvinistic arguers may be mere jargon. We advise the author to reconsider his opinion: we prize the learning, the clearness, and the sincerity, displayed in the statement of it; but we think its soundness likely to be denied both by the theologian and the metaphysician.

ART. VI.—*A Help to the Unlearned in the Study of the Holy Scriptures: being an Attempt to explain the Bible in a familiar Way. Adapted to common Apprehensions, and according to the Opinions of approved Commentators.* By MRS. TRIMMER, Author of *Sacred History*, &c. &c. 8vo. pp. 822.

MRS. TRIMMER's character is well known and highly esteemed. The poor have found in her a benevolent friend, and, in some instances, a judicious instructress; but for the employment which she has here undertaken she is by no means qualified. Other talents than this good lady possesses, are requisite in those who would unfold to the uninformed the volume of holy writ. In aiming to be familiar, she is often eminently trifling: in her condescension to the weakness of those whom she would instruct, she sometimes derogates from the sublimity and force of the lessons of divine wisdom; and, throughout this ponderous book, one great object appears pre-eminent, the support of the established system both in doctrine and discipline—a system to which we have no doubt she is sincerely attached. Had she confined her recommendation of this to such passages of scripture as clearly authorized her to do so, she would have been in the way of her duty: but she has tortured many a passage to effect this purpose, and advanced interpretations for which she can shew no warrant. A few short extracts will be sufficient to shew the character of this work, and to justify the remarks we have advanced.

"Gen. xiv. ver. 18.—Observe, what is said of Melchizedec, and the blessing he pronounced upon Abram, and what Abram gave to the priest of the most high God. From which we learn that it is agreeable to the will of God that the people should pay tithes to his ministers. Farmers, therefore, and others of whom tithes are demanded, should pay them to the clergy with a willing mind, as an offering to God for increasing the fruits of the earth."

"Psalm xcii.—The instruments, mentioned ver. 3, were always used in the temple service at Jerusalem; and in many christian churches there are organs, which are great helps to devotion when people mind properly what they are about; but very often they attend only to the music, as an amusement, which is a great profanation of the Lord's house and his holy worship. They should sing to the praise and glory of God, as the clerk calls upon them to do."

"Matt. xvii. ver. 22.—From our Lord's sending Peter to catch a fish, we learn, that in cases of necessity we should work in our respective callings, in order to earn money, since God's blessing attends honest industry. If Peter had not found money in the mouth of the fish, the sale of it would have fetched him something, and by fishing on he might have got a sufficient number of fish to produce the sum he wanted. It is plain from this miracle, that our blessed Lord, if he had chose it, could have got great riches for him-

self from the bottom of the sea; but he had renounced all the pomps and vanities of the world, and submitted to a state of poverty for the sake of mankind."

"St. John, xvii. ver. 20.—The concluding part of this solemn prayer was for all our Lord's faithful followers to the end of the world. 'To be *one with God the Father and with God the Son*, ver. 21, must signify, to have the Holy Spirit imparted to them. 'This was the glory which our Saviour gave to all his faithful disciples, to be united with God by means of the Holy Spirit, which is given by the Father through the Son."

Mrs. Trimmer is very reprehensible for having used, in this passage, and in a manner which has the appearance of artifice, a phrase that does not occur in the scriptures either of the Old or New Testament.

"Acts, xiii. ver. 1, 4.—Observe, that the apostles and all the first ministers of the gospel were directed by the immediate inspiration of God. There is no occasion for this now, as every thing our Saviour and the apostles taught as necessary for salvation may be read in the Bible; but as the sacred books were written at first in other languages, and the gift of tongues is not continued, it is proper that christian ministers should be learned men. The work for which Barnabas and Paul were separated, was that of preaching to the Gentiles. Observe, that they were ordained to this holy office by the laying on of the hands of the apostles. This rule has been kept up in the christian church from the time of the apostles. The bishops, who are now at the head of the church, practise it, and every clergyman is ordained first *deacon*, and afterwards *priest*, with solemn prayer and the laying on of the hands of the bishops, who are so far in the apostles' place, that it rests with them to see that no false doctrine is taught in the church, and that its holy ordinances, amongst which is the laying on of their hands, are observed, and an order of regular ministers kept up. *John*, who is mentioned ver. 5, was *John Mark*, not St. John the Evangelist."

In a short introduction to the epistles we meet with the following:

"Christians of the present day are therefore under very different circumstances from those of the apostles' times. They have neither Jews nor heathens to dispute with. They have the written scriptures for their guide; they know that they are delivered from the burden of the Mosaic law: and that they have nothing to do with the doctrines of the heathen philosophers; and those of this happy country are free from persecution; they have churches in which they may assemble without fear or danger; they have a regular order of ministers, which may be traced up to those who were first ordained by the laying on of

the hands of the apostles, according to Jesus Christ's holy institution; and they have an established form of worship, in every respect agreeable to the doctrines of our Saviour and his apostles. Christians of the present day, therefore, have no reasonable cause for dissensions; they can have no occasion to assemble in fields, or to make churches of private houses, in order to hear the gospel.

"But unhappily there has been a great falling off from the established church; and there is a great number of sects and parties amongst us; still, however, the established church, as maintained in the kingdom, is a true branch of the holy universal church, built on the *foundation of the apostles*, Jesus Christ himself being the *chief corner-stone*. The members of the church of England therefore, that is, all who have been baptized in their infancy, or at any time according to the office of baptism in the Common Prayer Book, are bound to continue firm to its ordinances and doctrines to the end of their lives; for they cannot find any good, that is, any *scriptural reason* for departing from it; and they should carefully guard against the insinuations of those who would draw them away from it; but at the same time they should also avoid giving way to a contentious and persecuting spirit."

Again:

"1. Cor. iv. ver. 1, 7.—In these verses the apostle teaches christians in what light they should regard those who are ordained of God to instruct them in the religion of Christ. By the *mysteries of God*, we are to understand the great truths of revealed religion, and the two sacraments, baptism, and the Lord's supper, which it is the duty of the ministers of Christ to explain to the people, and administer agreeably to the word of God. Those who hold this sacred office should be revered by their people, and not judged hardly of by them. It certainly is an offence to God, when people set themselves against the ministers of the church; whoever is disposed or persuaded to do so, should call to mind the apostle's admonition in the fifth verse."

We shall produce but one more quotation, of itself enough to shew that they who trust themselves to Mrs. Trimmer's guidance, may indeed learn what she believes, but not what the scriptures teach.

"1 John, v. ver. 1, 9.—From these verses we learn that none are the true children of God but those who believe in his Son, and keep his commandments; and that this is no difficult task—also, that through faith in Christ we may overcome the temptations of the world. Ver. 6 means that Jesus Christ, who was baptized with water by John the Baptist, and shed his blood for mankind, was really the Son of God. Ver. 7. In the text we have the doctrine of the Trinity, the Father, the Son, and the Holy Ghost, three divine persons in one God. How this can be, is beyond our power to comprehend, but while we

cannot understand our own nature, consisting of body and soul, we must not wonder that we should not be able to understand the nature of the Godhead, so infinitely above us. In the New Testament we read of the Father as God, of the Son as God, and of the Holy Ghost as God, yet we are repeatedly told that there is but one God; these three therefore must be in that one God, which is all that can be known by us."

Is it possible that Mrs. Trimmer should undertake to comment upon the scrip-

tures, and not know that the most orthodox divines of the established church have demonstrated that the words upon which she here lays so much stress are interpolated? If so, what is this ponderous volume but a blind guide to lead the blind astray? If she did know this, then a heavier charge lies against her; a charge, however, which we have too good an opinion of her heart to suppose can be fairly alleged. But every scribe should be well instructed.

ART. VII. *The Old Testament illustrated: being Explications of remarkable Facts and Passages in the Jewish Scriptures, which have been objected to by Unbelievers, and the proper Understanding of which may be rendered conducive to a further Acquaintance with the Christian Dispensation. In a Series of Lectures to Young Persons.* By SAMUEL PARKER. 12mo. pp. 376.

THE design of this little compilation is good—but Mr. Parker's apprehensions are not unfounded, that "critics may probably find great imperfection in the execution of the work." "His object has been," as he informs us, "to select from the writings of others, and some of them men of considerable celebrity, passages, which have a tendency to elucidate various parts of the Old Testament, and to remove, or lessen, the objections of unbelievers." Had this plan been executed with judgment, it would have proved extremely valuable. The efforts of the present compiler will not be wholly lost, but their benefits would have been much

more extensive and more lasting, had the numerous passages which he has collected from the most approved writers been properly arranged, and connected by some pertinent and judicious original observations. A few reflections by Mr. Parker himself do indeed occur, but the work would have lost none of its value had they been wholly suppressed. This little work, however, may with great advantage be put into the hands of young persons; it will furnish them with many excellent replies to the cavils of unbelievers; and especially will direct them to more copious sources of information.

ART. VIII. *An Inquiry, whether the Description of Babylon, contained in the XVIIIth Chapter of the Revelations, agrees perfectly with Rome as a City? &c. In a Letter to the Reverend Mr. ***.* By GRANVILLE SHARP. 12mo. pp. 253.

THE questions which have occasioned this inquiry, are the following: "Whether the description of Babylon, contained in the xviiith chapter of the Revelations, agrees perfectly with Rome as a city, a commercial city inhabited and visited by merchants and traders? and whether it may not be applied with propriety to some other opulent and mercantile cities?" p. 2. Mr. G. Sharp decides that it applies to Rome. Following the track which has been long occupied by protestant interpreters of this wonderful book, Mr. Sharp endeavours to prove that Rome not only has been, but still is, notoriously guilty of all the three Babylonian crimes, idolatry, sorcery, and bloodshed; and of her being a trading city there can, he imagines, be

no doubt, when it is remembered what an extensive sale of *indulgences* has been carried on in it—a traffic in the *bodies and souls of men*!!

Among many curious passages which occur in this curious little work, none is perhaps more remarkable than that in which the author speaks of the fatal endeavours to bring about a war against France. "Of the late Mr. Edmund Burke, who was himself a real papistical jacobin, at the same time that he accused the English people of having eighty thousand jacobins among them, in order to inculcate the idea of a necessity to exercise a power beyond the law, and to promote the illegal measure of suspending it." p. 62.

EVIDENCES OF NATURAL AND REVEALED RELIGION.

ART. IX. *Popular Evidences of Natural Religion and Christianity.* By the Reverend THOMAS WATSON. 8vo. pp. 477.

THE author of this useful work has thought it necessary "to offer some apo-

logy to the world for bringing it forward, whilst we have in our own language so many excellent treatises on the same subject, and especially after that most excellent performance of Dr. Paley's "Elements of Natural Theology." But no apology can be required by any candid reader. Derham and Ray, and others who have entered upon the same argument, are too learned, as Mr. Watson justly observes, for those who have not some previous acquaintance with the subjects on which they treat. A more popular work was wanting, and Mr. Watson has endeavoured, and not without considerable success, to supply the defect.

In the three first chapters the author endeavours to settle the respective claims of religion and modern philosophy. He shews that the title of philosophy is unjustly usurped by infidelity, and that it belongs properly to religion; he examines with some degree of severity the general characters, the acts, the talents, and the favourite studies, of infidel philosophers, and ably supports the pretensions of religion to wisdom, as being founded upon right reason, and leading to the supreme good. Here he has borne somewhat too hard upon metaphysical pursuits. We agree indeed with an author that "these are the most uncertain of all studies; that they have given birth to wrangling and endless disputation; and that they have been perverted by men of talents and ingenuity to puzzle, to perplex, and bewilder, the world;"—but they ought not to be thus indiscriminately condemned. Metaphysics have been successfully employed in the cause of moral and religious truth, and they present some subjects, not merely of curious, but of important speculation. The author's inquiries are next directed to the probability that there are beings in the universe superior to men, and that the planets are peopled by such beings; and from these conjectures, for they are nothing else, he deduces the possibility of the existence of a first great and invisible cause of all things. Happily he has "surer words" in store to confirm our belief in this article. He then conjectures again that rational beings may pass through different states of existence as other animals and even vegetables are known to do, and thus may rise again after death: but in the second part of this work we meet with something better than such imperfect analogies, upon which we may rest our hope of a future state of being.

These observations form the subject of the four first chapters, and may be considered as introductory to the chief design of the work. After a few remarks upon atheism, our author proceeds to prove the existence and perfections of a Supreme Being. His argument is "from the effects to the cause, from the visible creation to the invisible creator." He first takes a general view of the universe; the union, the connection, the preservation, of all things, are adduced as evidences of the being—the unity and the providence of God. He then descends to a more particular examination of some of the most important or striking parts; he shews what the sun, the moon, the stars, the seasons, and the great deep, depose concerning the existence and the attributes of the Supreme Being. Man is presented to our notice next; his nature, his excellences, his imperfections, are all adduced to contribute to the demonstration that there is a God, and that he rules over the creatures whom he has formed. A few of the most remarkable quadrupeds—and the different provisions made for them—some striking facts in the history of birds and of insects, are likewise mentioned as tending to the same conclusion, that the works of nature are irrefragable arguments of the being and the providence of an intelligent first cause of all things. The various relations which animals bear to men—their use, their dependance, their hostility, are shewn to be illustrations of the power, wisdom, or goodness, of the Creator. As a conclusion to this first part of his work, our author very properly calls the attention of his readers to the noble powers and faculties of man, as strong additional evidences of the existence and perfections of the Supreme Being.

From this sketch it will be readily perceived, that Mr. Watson does not in this investigation interfere with Dr. Paley. We subjoin an extract from the first part of this treatise, which will in part clearly evince this, and afford a specimen of our author's manner. Dr. Paley thinks but little of the evidence that astronomy furnishes; it did not suit the peculiar nature of his argument. Mr. Watson regards the heavenly bodies as well adapted to display the being and the excellences of the Creator. He has accordingly in a popular and familiar manner shewn that the glory of God is strikingly manifested in the firmament. He thus speaks of the moon:

"This light (viz. of the moon) is wisely proportioned to the seasons and climates that most need such assistance. This distribution is so apparent, that it cannot fail to call the attentive observer to notice the wisdom and goodness of such an appointment.

"In summer when we have little occasion for this additional light, the arch that the full moon describes in these months, is a small portion of a large circle. Her duration is then very short. She barely shews her full orb, and descends to visit climes that require more of her friendly aid. In these northern latitudes, she makes a short range above our southern horizon, nearly about the same compass that the sun takes during our shortest day; and in many cases her stay is even much shorter. She is then little wanted, and is therefore but little seen and very little regarded.

"Whilst, during the winter season, and our shortest days, the full moon takes a wide circuit, rising far towards the north, and passing our meridian in a high elevation, she descends in our western boundary, and generally near the same place that the sun sets in our longest day. Her stay above our horizon is during the whole night; her duration is nearly equal to the sun's duration in our longest day, and sometimes much longer. (This depends upon her latitude at the time.) At this time in the depth of winter, mankind most want her benefit, and therefore at this time it is shared out to them in the greater degree.

"In the highest latitudes, and the further removed from the benefit of the sun, the full moon continues the longest, endeavouring to supply that want to the inhabitants. In our northern hemisphere, the further north that any country is removed, so much a greater share have the inhabitants of the winter's full moon.

"What I have said here with respect to the benefits of this planet, applies equally to both the northern and southern hemispheres. They enjoy all a share in her benefits in proportion to their wants.

"Now, if we were to reverse the case, and suppose the full moon in summer should take a wide range above our horizon; and, on the contrary, that in winter she should hasten her departure, coming forth only to shew her full orb, and descend suddenly and leave the world in darkness, we should certainly censure the wisdom of the appointment, as bearing in it no marks of benevolence and goodness. But this is not the character of any part of God's works; the more they are sought into and the better they are understood, the more marks of beneficence do we find.

"It may be argued, that these benefits arise entirely from the mechanism of the universe, and are governed by fixed and stedfast laws. This, most certainly, is the case; but who has constituted these laws? and who planned this wonderful frame of nature? The answer to this question leads us to the ac-

knowledgment of the wisdom and goodness of the Great First Cause."

"During the months of the harvest, the full moon continues with us much longer than during any other months of the year. At that period she hastens her rising, as if to call on the husbandman to collect the fruits of the earth under her friendly assistance. During the first seven or eight days after the full, you will find her generally up before the light of day has totally forsaken the skies. From the first to the last of these eight days, the difference between the time of rising will in general be found to be less than two hours. This difference, however, varies in different places; and there is some variation in the same place in different years. The principles and causes of this appearance, this is not the place to examine and explain. A slight acquaintance with the globes renders the whole phenomenon perfectly intelligible. It is sufficient here merely to state the fact, and to call the attention of those, who may not have considered this appearance, to the examination of a fact, which affords a pleasing testimony of the care and goodness of our heavenly father.

"This becomes a phenomenon more striking, when compared with the full moons in the opposite seasons of the year. During the spring season the full moons quickly pass away. The second or third night after the full, she rises late, and in a night or two more it is very near morning before she makes her appearance. At that season the husbandman has no great occasion to prolong his labours in the field. At that time, generally cold and uncomfortable, it would be neither pleasing nor suited to his health to expose himself to the severity of cold damp nights. But during the months of harvest, when the gathering in of the fruits of the earth is the important labour of the husbandman; when the sustenance of the whole year depends very much on his diligence at that season; when he is under the necessity of using every exertion to prevent the uncertainty of the seasons; and when these months are generally soft and mild; our great parent and benefactor gives them extraordinary assistance, by sending to us sooner and protracting longer the stay of the friendly moon. All his works praise him, and bear testimony to his providence and care. *And oh! that men would praise the Lord for his goodness, and for his wonderful works to the children of men.*"

Having in the conclusion of the first part of this treatise shewn that man is formed for religion, Mr. Watson proceeds in the second part to exhibit in the same familiar manner the evidences of the truth of christianity. He insists chiefly upon those which are usually denominated internal. He shews that the evidence we have is the best that can be desired; and taking the prominent parts of this evidence as it is usually exhibited, he illustrates

them with much ability and effect, and in a manner suited to the common capacities of mankind. We cannot enter into an analysis of this part of the work, nor is it necessary, as Mr. Watson takes no new ground. If he has produced any observations not usually to be found in treatises upon this subject, it is in the concluding chapter, in which he examines some collateral evidences, and particularly the institution of the Lord's supper. We were much pleased with the following very just and striking passage:

"In this institution, we meet, not only with a remarkable instance of his knowledge of the heart of man, by that accuracy with which he foretells their several failings, which were faithfully accomplished, but also of his insight into futurity, by assuring them that he would still have a church and a people to celebrate the benefits conferred by him on the world, and to preserve the remembrance of his dying love. What other can be that command which contains the essential parts of this institution, *Do this in remembrance of me*? Never was there a time so unlikely for its accomplishment. He was the next day to be crucified, and all his disciples would abandon him: and these things he also foresaw and foretold. The continuance of his church was not then an accidental circumstance, which arose from a combination of unexpected events, neither within the knowledge nor subject to the direction of men; but an event long foreseen and provided for by him, who is our great lord and head.

"Had he foretold this event a few days before, when riding in triumph to Jerusalem, we might have considered it as a fortunate prediction, thrown out in the enthusiasm of his greatness and ambition; and that it had been brought about contrary to all probability. But it is delivered at a time when, to all human appearance, he had not the smallest prospect of a church, or so much as a single follower; at a time when he saw himself within the grasp of his relentless enemies: it was within a few hours of his being led to mount Calvary, to undergo an ignominious death. It was amidst his very preparations for this death, that he gave forth that command, *to do this in remembrance of me*. The next day he knew he was to be crucified, his enemies were to triumph over him; and who, after this, would either dare or chuse to remember him? After this tragical end, the disciples do not seem to have entertained the smallest idea of ever again acknowledging Christ. Concealed in different lurking places in Jerusalem, or wandering dejected and solitary in its neighbourhood, they only thought that *it was he who should have redeemed Israel*;

but meeting with this dreadful disappointment, they seem totally to have abandoned this hopeless and ruined cause.

"Their state of mind during this suspense was singular and distressing; they never blamed their master, they never urged that they had been deceived: bewildered in the greatness of their grief, and the extraordinary change that they had so lately seen, their love never sinks, and yet they dare not hope.

"They believed not his resurrection when it was first announced to them, and some of them refused to believe even the testimony of the whole disciples when they affirmed this great event.

"It is scarcely possible to bring the evidence of the gospel to a severer test. If there had not been something extraordinary in his character, how can we account for their rallying again after this fatal dispersion, and their firm adherence to him ever after? Now we have, in this ordinance, a standing monument to convince us of the truth of his prediction, and all its circumstances; and the whole history of the world, and both friends and enemies, must acknowledge its accomplishment. From his cross a church instantly sprung up, it increased rapidly, and hath extended its arms to the different quarters of the world; and the experience of eighteen hundred years assures us, that he has been remembered, remembered in this very ordinance, and that remembrance must endure till Christ come again.

"Go back again to this important scene: behold the Saviour of the world, assembled with his disciples for the last time before his sufferings; see the father of this little family taking his farewell of his children, delivering to them his dying command, and fixing a period for the duration of its observance. Every thing corresponds exactly to this prediction. The scene throughout, not so awful and sublime as the wonders of nature at his crucifixion, yet speaks to us in calm but strong language, which all nations and ages hear, *truly this was the son of God*."

Upon the whole, we can venture to promise our readers that they will find great pleasure, and much valuable instruction, from this performance. It discovers sound judgment and rational piety; and in the hands of many to whom Dr. Paley's Elements would be of comparatively little service, may be of considerable use to confirm their faith, and at the same time to suggest some lessons of practical utility. The style in many parts betrays a north Briton; and is throughout less correct than the value of the work required, and less polished than the nature of the work allowed.

1804, at the Lecture founded by the Right Reverend William Warburton, Lord Bishop of Gloucester. By ROBERT NARES, A. M., F. R. S., F. A. S., Archdeacon of Stafford, &c. 8vo. pp. 371.

THERE is no subject, we believe, in the whole compass of theological inquiry, attended with so many difficulties as that of prophecy; particularly that branch of prophecy which is usually produced from the Jewish scriptures; by Christian writers, as relating to the Messiah. These difficulties have been felt and acknowledged by the soundest divines and the ablest critics, and several attempts have been made to remove from so very important a part of the Old Testament the obscurities which prevail in it, and the apparent inconsistencies which arise from the usual and the reputedly orthodox mode of interpretation. Mr. Nares, however, has been perplexed by no difficulties himself, and consequently has not felt the necessity of preventing or removing such as some of his readers may have experienced. He enters into no investigation of those passages which both Jews and Christians have denied to be applicable to Jesus of Nazareth: he disdains to regard the connection in which they appear; or if he ever throws out a hint that other events than those which distinguished the life of Christ might be originally predicted, he removes every difficulty by the magic touch of a type, or a double sense. There are many inquirers whom this will not satisfy; but for inquirers the arch-deacon's work does not seem intended. He treads over the old ground, removing no impediments, nor exhibiting any additional light.

"Prophecy may be usefully characterized, as a *miracle, of which the testimony remains in itself*. It is a miracle, because to foretell events, to which no chain of circumstances leads, no train of probabilities points, is as much beyond the power of human agents, as to cure diseases with a word, or even to raise the dead. But that actions of the latter kind were ever performed can be proved, at a distant period, only by witnesses; against whose testimony cavils may be raised, or causes for doubt advanced. But the man who reads a prophecy, and perceives the corresponding event, is *himself* the witness of the miracle: he sees that thus it is, and that thus, by human means, it could not possibly have been.

"A prophecy yet unfulfilled is a miracle at present incomplete; and these, if numerous, may be considered as the seeds of future conviction, ready to grow up and bear their fruit, whenever the corresponding facts shall be exhibited on the theatre of the world. Will the sceptic then say that a man should disbelieve

even his own knowledge, when it bears witness to circumstances so extraordinary? As well might he say it, as reject the testimony of miracles, merely because it gives evidence to facts of very unusual occurrence. Yet, in the instance of prophecy, absurdity can hardly go so far.

"The Holy Scriptures are thickly sown with the seeds of prophecy, from the beginning even to the end; and these have been gradually developed throughout the history of man; and will be more and more unfolded to the consummation of things, respecting this present world. A series of prophets, it has been already observed, was given to the nation of Israel, to preserve them from the abominable superstitions, and idolatrous divinations, of the nations among whom they dwelt. But this was not the origin of prophecy. It originated in the earliest period of the world, from God himself, who foretold to Adam and the Patriarchs the distant hopes of restoration and redemption, provided for the human race. The prophetic spirit was next communicated to the Patriarchs, and rested more especially upon *Moses*; whose inspiration had at once a retrospect to the period of creation, and a view to the redemption of man; and even to the most distant fates of the chosen people, whom he had conducted out of Egypt. It was imparted, through a series of prophets, till the completion of the canon of the ancient scriptures. It was again poured out, without measure, upon our blessed Saviour, and was continued to his apostles, till the second canon of the scriptures was also closed, by the Revelation given to St. John."

Upon these principles the plan of these lectures is formed.

"The great and general bond of union between the covenants is, in truth, that of **PROPHECY**; by which the Holy Spirit has miraculously connected the beginning and the end of the world. Wherever man is found, there also are the pervading rays of **DIVINE PRESCIENCE**, either tending to our Saviour, and marking him out as the **MESSIAH** of God; or proceeding from HIM, and giving light to the faithful, even till the final day of universal judgment.

"Prophecy, in its most intimate connection with Christianity, has this extent and compass; and our blessed Saviour gave an account only of one division of the subject, when he explained, in the ancient scriptures, the prophecies that related to himself. It was, however, as much as could at that time be given. His own predictions, with those of his apostles, and such of the Jewish oracles as extend beyond the period of his first advent,—all these are to be weighed by a Christian of this day, if he would contemplate the whole

force of prophecy, as applicable to our Saviour, and to those who call upon his name.

"This, therefore, is the kind of view proposed to be taken in the present Lectures; I. First, *comprehending the prophecies that relate to our Saviour, as Author and perpetual Head of the Christian Church*: II. Secondly, *those which foretel the fate of his disciples, whether advance or prosperous, from the time of his departure from them, to that of his last most solemn advent*. These will form two grand divisions of the subject."

In seven successive sermons the prophecies relating, or thought to relate, to our Saviour are enumerated. From the books of Moses are produced the prophecy given to Adam concerning the seed of the woman; the promises made to Abraham and to Jacob; the benediction of this latter patriarch upon Judah; *the prophecy of TYPES*, such as the passover and other observances amongst the Jews: the prediction of Balaam, and the declaration of Moses respecting a prophet that was to be raised from the midst of the Jewish people. From the time of Moses to that of David, no direct prophecy concerning the Messiah is known to have been delivered. In the reign of that king it was foretold that Solomon should be settled in the house of God, and in the kingdom, *for ever*, and that his throne should be established *for evermore*. This Mr. Nares concludes must refer to the Messiah, though he acknowledges that "it might require, perhaps, some persuasion to convince us that this divine oracle had in truth so exalted a meaning and reference, were it not confirmed by other circumstances." p. 132. These circumstances are deduced from a few passages of scripture with which this has no connection! David himself then comes under consideration in two points of view: 1st, as a type of the Messiah; and 2dly, as an inspired person, enabled to foretel his advent, his sufferings, his glory, and his everlasting kingdom. To trace whatever may be applicable to our Saviour in the Psalms of David, Mr. Nares asserts, would be to transcribe a large part of those sacred hymns. He therefore confines himself to those passages which are actually cited in the New Testament. The Psalms particularly, but yet briefly, noticed, are: the 2d, 16th, 22d, 41st, 110th, and 118th. Upon this subject Mr. Nares has produced an authority, which by all good Christians will undoubtedly be esteemed of very great weight. "The apostate spirit himself, (he gravely observes, p. 165.) according to the narrative of the evangelists,

confessed that the Psalms were prophetic of the Son of God; for he said in the course of his temptation, alluding to the 61st Psalm, 'If thou be the Son of God, cast thyself down: for it is written, he shall give his angels charge concerning thee, and in their hands shall they bear thee up, lest at any time thou dash thy foot against a stone.' In this, as in some other instances of evil spirits, reluctant testimony was borne to the truth, by those who were most alienated from it."

Solomon is then cited both as a type of the Messiah, and likewise a prophet. His predictions concerning the Messiah are said to be found in the 132d Psalm. The sixteen prophets then pass under a very hasty review; and all except Jonah, Nahum, Zephaniah, and Habakkuk, are asserted to have prophesied of Christ.

With Malachi closed the series of prophecies under the Jewish dispensation. Four hundred years ensued, during which the divine oracles were silent. Then came the fulness of time; and the subject of prophecy appeared, and began a new series of astonishing and important predictions; some now fulfilled, others waiting the time of their accomplishment.

"Messiah was certainly to be a sovereign, of whose kingdom there was to be no end: but Jesus expressly declared, that his kingdom, as man, was not of this world; and that his triumph would be hereafter, in the clouds of heaven. Conformably to this right interpretation of the ancient prophecies, our Saviour predicted the treachery of one disciple, the consternation and desertion of the rest, and his own death upon the cross. His view, however, rested not here. He looked forward to his resurrection and ascension; to the effusion of the Holy Spirit upon his apostles; to their successful preaching in all the world; to the rejection of the Jews, and the conversion of the Gentiles; events which, though impossible for human sagacity to foresee, certainly took place, and justified his words. With more minute exactness did he foretel that judicial visitation of Jerusalem (at that time in the highest degree improbable), when its state and polity should be destroyed, and its magnificent temple levelled with the dust. This prediction, strictly limited to time for its fulfilment, is, of all that ever were given, the most exact and circumstantial, and affords, therefore, the most perfect proof of miraculous foreknowledge in the prophet who pronounced it.

"Various other particulars, then hidden from every mortal eye, and discoverable by no analogy which could be founded on the course of human events, were predicted by our blessed Saviour. Such as the persecution of his disciples; the fortitude of some, and

even the particular fate of others; the divisions and dissensions of christians among themselves; and the secure permanency of the church, under every circumstance of external or internal disadvantage. These things, which have always been fulfilling, from that time to this, and will be to the end of the world, are standing proofs of divine knowledge, in him by whom they were foretold;—proofs incapable of refutation or contradiction.”

The prophecies by our Lord, and his disciples, are then arranged by our preacher, under ten different heads, and very briefly and imperfectly discussed in the three concluding discourses:—1st, The rejection of the Jews and call of the Gentiles; 2d, The preaching of the gospel throughout the world; 3d, The persecutions of the apostles and their converts; 4th, The destruction of Jerusalem; 5th, The fate of Rome and its conversion; 6th, The rise of Mahomet and the Saracenic power; 7th, The rise and character of Antichrist; 8th, The conversion of the Jews; 9th, The general prevalence of the

gospel; and 10th, The universal resurrection, and day of judgment.

We have thus given a faithful outline of these lectures, from which our readers will be able to form some good judgment of the nature and extent of the information they convey. We are sorry that we cannot congratulate the lecturer upon having fully answered the intention of the right rev. founder, by adding to the evidence of “the truth of revealed religion in general, and of the christian in particular.” Nor can we congratulate the inquirer after religious truth upon his having a rational and a safe guide through the intricate mazes of prophecy, in which so many have been bewildered and lost. One principle pervades the work, which is manifestly unfounded; that the language of the jewish prophets, which the writers of the New Testament have applied to Christ, must necessarily have been originally spoken in reference to him: and frequent passages occur to which many sincere believers will not be able to assent, and by which the sceptic will not be favourably impressed.

DOCTRINAL AND CONTROVERSIAL THEOLOGY.

ART. XI. *The Christian System unfolded, in a Course of practical Essays on the principal Doctrines and Duties of Christianity. In Three Volumes, 8vo. By THOMAS ROBINSON, M. A., Vicar of St. Mary's, Leicester. pp. 433, 499, and 539.*

THE author of this work is not unknown to the religious world. He is a person of some consideration in the daily increasing class of those who denominate themselves ‘True Churchmen,’ amongst the adherents to whom he has gained celebrity, by a large, ‘Treatise on Scripture Characters,’ and by some tracts of less magnitude and importance.

“The chief attention of his life,” he informs us, “has been occupied upon the subjects of the work which he has now submitted to the public eye, not merely in the retirement of his study, but in the active performance of his ministerial duties. He has been labouring, not without effect, to establish among the people of his charge what he conceives to be the fundamental principles of the gospel, and upon them as a firm basis to erect the superstructure of christian morality, of solid devotion, and of vital holiness. And now, with a view to their spiritual progress, and in the hope that his instructions may be remembered with advantage after his personal services on earth are terminated, he sends to them from the press the substance of what he has invariably delivered from the pulpit.”

We cannot convey to our readers any information respecting the design of this work better than in the words of the author:

“His plan has been, after considering the strong and decisive evidences of the inspiration of the Old and New Testament, and attending to that state of mind with which they ought to be received, to investigate what is their grand object, and what their most important contents. They were undoubtedly designed to communicate the knowledge of the true God and of his will concerning us. They exhibit his character in the varied perfections of his nature, and call upon us to yield to him all possible reverence, love, and obedience. They describe his formation of the earth, and the peculiar administration of its government by himself.

“Man is introduced to our view as a creature of high excellence and dignity, as bearing the image, and constituted the vicegerent, of Jehovah. But he is also represented as having fallen from his original eminence, and sunk into a deplorable state of depravation and misery.

“Here the system becomes unspeakably interesting. To console us in our distress, to rescue us from merited and impending ruin, a divine person interposes; and to him give all the scriptures witness. He is the grand subject of revelation: ‘the alpha and omega, the beginning and the ending.’ It is therefore requisite that we fix a large share of our attention upon him, and enquire what are the offices he sustains, and by what means he procures reconciliation for us. We behold him relinquishing the glories of the heavenly world,

and voluntarily submitting to the deepest humiliation and sufferings upon earth. He saves by various methods; and in the accomplishment of this great work a distinct consideration is given to his teaching, his example, his righteousness, his atonement, his intercession, and his government.

"Another divine person is introduced in this vast economy, co-operating with the Saviour, and fulfilling his gracious purposes. The Holy Ghost claims our adoration, affiance, gratitude, and love. By the most amazing process He recovers men to the knowledge, the similitude, the service, and the enjoyment of God. He brings them to the present possession of the blessings of redemption; He forms their character; He guides, preserves, and cheers them; and gradually prepares them for the fruition of the eternal inheritance reserved in heaven for them.

"Our attention is then directed to this 'chosen generation,' this 'peculiar people,' whom the Lord has saved. They are distinguished, not more by their high privileges and consolations, than by their steadfast perseverance in moral and religious duties. The rule of obedience is proposed, its extent is shewn, and its excellence vindicated. The servants of God are also men of prayer, and are daily surrounding the throne of grace with their importunate petitions. They are instructed what and how they should ask, and are assured that they shall obtain the blessings they supplicate. They are considered also in a collective capacity, are incorporated into a spiritual society, and by certain divine institutions they maintain communion with their heavenly Father and with each other. Such is the Church of Christ on earth; and all its faithful members are in succession removed to a better world, where the whole company will shortly be assembled together, and, receiving their 'perfect consummation and bliss both in body and soul,' shall reign with their exalted Head in glory everlasting.

"These are the outlines of the system here proposed, and the author does not hesitate to pronounce that the representation is scriptural, and contains the substance of genuine Christianity."

In filling up these outlines, the author has chosen to throw his system into the form of essays, of which there are, in the whole work, *ninety-eight*. The two first are introductory, upon the holy scriptures. Eight follow upon the attributes of the Deity. In the eleventh essay the subject of the Trinity is discussed. Eleven essays are next devoted to the consideration of Man, his creation, his fall, his misery, his salvation. This leads to the consideration of the Saviour, whose godhead, character, and office, are treated upon in the *nine* succeeding essays. These are followed by eight upon the personality, the divinity, the influences and operations of the Spirit.

ANS. REV. VOL. IV.

The fortieth essay is on true repentance, from which, to the fiftieth, the writer is occupied upon the subject of faith, its nature, its consequences, its divine origin, and its necessity. Seven Essays then claim our notice upon the nature, the progress, the completion, the author and means, the advantages and the necessity of sanctification. The fifty-eighth essay treats of christian obedience; the fifty-ninth of the comfort of the Holy Ghost; and the sixtieth of the witness of the spirit. In the sixty-first the writer endeavours to establish the necessity of keeping the commandments, meaning by them the decalogue delivered on Mount Sinai, and the nature and obligation of each commandment are discussed in fourteen succeeding essays; these are followed by one on prayer for special grace to keep the commandments. From the seventy-seventh to the eighty-fourth essay, inclusive, the several petitions of the Lord's prayer form the subjects of discussion, and these are succeeded by one on the church of Christ, one on public worship, five on the christian sacraments, baptism and the Lord's supper, one on the resurrection of the body, and one, which concludes the work, on the life everlasting.

Our readers are now able to judge of the design of this work, and of the principles upon which it is conducted. The author professes 'that he has not attached himself to any leader, however eminent for learning, piety, or usefulness, and that he does not wish to raise the standard of faction, or establish any Shibboleth. Whatever appellation may be given him, he declares that he will still maintain that he has followed no other guide than the inspired volume.' We are not disposed to call in question the author's veracity in making such professions; but we beg leave to express our regret that he has so often left the guide he had chosen, to wander after objects of his own imagination, or so totally neglected the directions which his sacred conductor afforded. We have seldom seen in the same compass so many passages of holy writ misinterpreted and misapplied. No enquiry is instituted concerning the connection of the most important texts of scripture; no attention is paid to the genuine sense of the original words, to the occasion on which they were written, to the sentiments which they were designed at first to recommend or to oppose. What opinions might not thus be discovered in the sacred volume; what opinions might not thus be shewn to have

L

the sanction of God's word? While theologians treat the scripture in so irreverent a manner, endless controversies must exist; various discordant and opposing creeds must be adopted and professed. Mr. Robinson very properly cautions his readers against 'setting up their own preconceived opinions, or carnal inclinations, against the bible. If it be indeed the word of the living God, it is an infallible and authoritative umpire in all doubts and disputations. We should therefore implicitly submit to its decisions, and bring all our systems, creeds, and purposes, to be examined by it.' This advice is good; but our author has exhibited, in his own instance, the difficulty of following it. He, like many others, with honest and upright intentions, have, perhaps unperceived by themselves, examined the scriptures by their own 'systems, creeds, and purposes.' The cause of religious truth is thus injured amongst those who profess to honour divine revelation; and the scriptures are brought into disrepute amongst many persons of discernment, who either, without giving themselves the trouble to enquire, imagine that the word of God, like the oracles of paganism, can be fairly made to utter opposing sentiments, or, satisfied that there can be but one sense affixed to the sacred writings, yet despairing, amidst such great variety, to discover that sense, leave the important enquiry, and treat with neglect the treasure of heavenly wisdom. We cordially agree with Mr. Robinson that the infidelity of many, and their total disregard of the scriptures, are chargeable upon the evil of their deeds; they come not to the light lest these their deeds should be reprov'd. But this is not the sole and universal cause of unbelief. It has been our lot to know some men of a sceptical disposition, but of very different characters; not 'proud philosophers,' not 'formalists,' not 'wilful and impenitent transgressors,' but men of meek and enquiring minds, sincerely desirous of fulfilling all their important duties in life, and in all the fruits of virtue more to be distinguished than many who make a noisy profession of religion, and who call down fire from heaven on all that worship not with them on their Zion. They withhold their reverence from the scriptures in consequence of seeing them irreverently treated by persons who professed a veneration for them: they deny their importance, because they observe that they are employed to justify the wildest fancies, and the most absurd opinions. We do

not vindicate such conduct; but we consider it, and would earnestly propose it to the supporters of systems, as a caution not, by a method of quoting and applying scripture which they would not adopt in respect of works of less value, to give occasion of offence to those who are not strong in faith.

Such observations as these have been suggested by the work before us; with what reason our readers shall judge from a few passages which we now select.

The following occurs in the *thirteenth Essay*.

"We begin with the understanding, and consider whether its present state be not such, as to prove that it has lost much of its original excellence. Man is still distinguished by his intellect from all other creatures upon earth. We mean not to decry the use of reason, or derogate from its importance. It is an inestimable talent, which we should do well to cultivate, and exert with diligence and fidelity, in the service and for the glory of its divine author. But, while we praise God for the precious gift, we should be aware of its degeneracy, and the injury it has sustained by the fall. This is, indeed, what few persons are willing to admit; for there is no endowment, of which we are more disposed to be proud. So just is the observation of Zophar, 'Vain man would be wise, though man be born like a wild ass's colt.' The description is instructive, but very mortifying. He aspires after knowledge which was never designed for him, and of which he is utterly incapable; he is conceited of his intellectual powers, as if they were able to discover and comprehend the nature, the attributes, and purposes of Jehovah, and considers not, that, in subjects of a spiritual kind, he may be filly compared to creatures the most ignorant and stupid. He is born so; and therefore this is universally the case, and results not from any peculiarly unfavourable circumstances, in which certain individuals may be placed. Like the animal here referred to, he is of himself, or without assistance, perfectly uninform'd, as well as altogether untractable, foolish, and perverse in the extreme, and not to be taught any thing but by severest discipline. This, it should seem, was an acknowledged truth in Job's time: may we seriously attend to it, and be deeply affected by it!"

Before Mr. Robinson ventured to lay so much stress upon this passage from Job, he should have been careful to enquire whether our translation fully expresses the sense of the original. A learned prelate has decided, that it does not; and has given a new version of it, which renders it utterly inapplicable to the doctrine of the above quotation. We shall subjoin that version with the note accompanying it, for the information of

Mr. Robinson, and the benefit of those of our readers who may peruse the essays. The observation of Zophar, according to Dr. Stock, is this :

"That the growing up person may gather sense ;

And the wild colt become a man."

And this much improved rendering of the original passage is, by the right reverend translator, thus justified and explained: "*The growing up person*] נָבֹנֵן part. Puhul of נָבַן, verb. frequent. from נָבַן to germinate; see Zech. ix. ult. The intention of divine punishments is to correct the wildness of youth, and to cause the savage to become, *to be born again*, a rational creature. וְיָלֵד is used in the sense of *becoming*, or *being rendered*, Prov. xvii. 17. as Scott remarks." See Dr. Stock's Version of the Book of Job.

Again, p. 256, 257. Mr. Robinson observes: "Our very hearts, the fruitful source of abominations, are offensive to God; and therefore it is that we are *by nature* the children of wrath." He sees, and must see, with abhorrence, that "lust of the flesh," that "carnal mind," that "φύσις σαρκος," which is enmity against him. This is the fault and corruption of the nature of every man, that is naturally engendered of the offspring of Adam,—which in "*every person born into this world deroveth God's wrath and damnation.*"

Here indeed is assumed somewhat of the appearance of learning; but what good end it is to answer we are at a loss to discover. The genuine import of "carnal mind" is not explained by quoting the original, φύσις σαρκος; nor is the phrase *by nature*, as used by the apostle, interpreted by the larger characters in which it is printed. These expressions are taken completely from their connection to serve the purpose of a system, and the sense which, according to the tenor of the apostle's argument, they must bear, is either entirely overlooked, or carefully concealed; neither of which circumstances is honourable in a professed teacher of christian doctrine.

We need not go far for another example of the fault which so glaringly pervades this performance. In the very page from which we have made the last extract, it is said,

"To the transgressor even of one precept it (i. e. the law) shews no mercy: for what is its language? "Cursed is every one that continueth not in all things,

which are written in the book of the law to do them:" nor is its sentence light. It dooms the sinner to final and everlasting misery. It declares him to be accursed of God: and that curse, if not removed, must issue in everlasting destruction." And again, p. 258. "The law discovers our true state, and pronounces our doom. 'For by the law is the knowledge of sin; it worketh wrath; the commandment which was ordained to life, I found to be unto death; it is the ministration of death and condemnation.'"

Are the reasonings of the apostle urged upon the Jew to prove the wisdom and necessity of abandoning the Mosaic dispensation, and of adhering solely to the more liberal principles of Jesus, to be thus applied without any discrimination to the state of those who were never subject to its authority? Is the christian system likely to be unfolded by any one who heaps text upon text, without any consideration of their primary meaning?

He who undertakes to explain or defend opinions which are usually deemed of high importance, should be extremely careful to take no ground from which there is any danger of his being driven. The success of an adversary will weaken the confidence which it is his object to gain; and the detection of one unfounded argument will induce a suspicion of the validity of all the rest. Mr. Robinson does not appear to have considered this when he wrote the following paragraph in his twenty-third essay. Vol. I. p. 307.

"St. John admonished his christian brethren to beware of idolatry; but it is idolatry to give divine honours to Christ, if he be not God in the proper and full sense of the word; and yet the apostle, whilst delivering the caution, declares with peculiar emphasis, 'This is the true God and eternal life.'"

A careful perusal of the whole passage, of which this is only a part, immediately points out the antecedent to "*this*." In our common version (but not in the old English versions), an unwarrantable liberty has indeed been taken which might embarrass a mere English reader; but Mr. Robinson ought to have known what the original really teaches in this passage, and how clearly the most eminent critics, whose orthodoxy is beyond suspicion, have proved that the antecedent is *him*, not Jesus Christ. Our reverend essayist, fearful of the "subtleties of criticism," see p. 306. seems very cautiously to avoid

that exact and scrupulous enquiry into every passage, and into every construction, and into every term, which is necessary in one who would teach the *christian* system.

A few lines below the passage we have just quoted, Jude is said to style Jesus "the only wise God." Here the author refers to the doxology in this epistle, beginning thus: "To the only wise God our saviour." And is Mr. Robinson so little versed in the language of scripture as not to know that the epithet "saviour" is applied to the Father?

We cannot refrain from laying before our readers an instance or two more, though the character of our author, as a critic in scripture, may have been already shewn with sufficient clearness.

"To the Philippians also he (i. e. Paul) declares his firm determination to renounce all reliance upon his own obedience and attainments, and his fervent desire and expectation to stand complete before God, as considered only in his saviour: "That I may win Christ," said he, "and be found in him, not having mine own righteousness, which is of the law, but that which is through the faith of Christ, the righteousness which is of God by faith." These are clear and incontrovertible testimonies, that St. Paul looked for eternal life as procured for him by the merit of his Lord and master, and that he taught men every where to cherish the same hopes. We need not fear to follow such an example, or to adopt his expressions, however unfashionable they may now be, in laying down or explaining our system of faith."

If this part of the system depends upon the text here quoted, it must fall. Here, as before, no attention is paid to the meaning affixed by the apostle to the terms *law* or *righteousness*, nor any account taken of the connection in which they appear, apparently for no other reason than that enquiries of this nature would have prevented the passage from being adduced. But is it thus, by refraining from a strict regard to the situation as well as to the import of the leading terms, that a knowledge of the christian system can be obtained?

We select the following from the essay on the influences and operations of the Spirit.

"In our Lord's last solemn address to his disciples, who were dreading his departure from them, he suggested to them for their consolation, that his place would be supplied, and his gracious purposes carried on, by the continual presence and effectual working of the Holy Ghost. On this consideration, above all others, he grounded his exhortations to them, and his expressions clearly shew, that

the promise was intended, not for them only as individuals, but for the benefit of his church in all ages. "I will pray the Father, and he shall give you another comforter, that he may abide with you for ever; even the spirit of truth.—And when he is come, he will reprove the world of sin, and of righteousness, and of judgment." "The world" is too extensive a term, in whatever sense we understand it, to be confined to the apostles, or even to the christians of their day; and the whole passage amounts to an engagement on the part of Christ, to support his faithful people at all times, and to bring men to the knowledge and experience of his salvation, by the energy of the Holy Ghost, who alone can effect it."

Is the term *world*, indeed, a term too extensive to be confined to the christians of the apostles' days? How then did it happen that our Lord himself applied that very term to the unbelieving Jews, who had hated him, and were to hate his followers? Compare John chap. xv. 18, 19; also chap. vii. 7. Why then did this evangelist in his first chapter call the Jewish people *the world*? Chap. i. 10. Why has Paul in so many passages distinguished the Gentiles by that term? What then is meant by that term, when in John xiii. 19, it is said, "the world is gone after him?" What—but why need we multiply such questions? They are readily answered by any one moderately versed in the knowledge of language. We refer Mr. Robinson to that excellent lexicographer Schleusner. In his invaluable lexicon, Nov. Test. art. *κοσμος*, No. 4. β. he will find many other passages than those to which we have directed his attention, demonstrating that the term has frequently, a confined or limited meaning. "Significat, observes Schl. ut *mundus* apud Latinos, *magnam hominum multitudinem*, ex contextu oratione definiendam." But Mr. Robinson is one of those interpreters of scripture who despise the *contexta oratio*.

We could fill many pages with extracts and remarks similar to the preceding. But we must forbear. What we have said, it must be evident, proceeds from no wish to controvert the system which the author believes has the sanction of scripture; but from a cordial desire of seeing the word of God more reverently treated, and of entering our protest against a practice so injurious to true religion, as that which pervades these volumes. In a work avowedly popular, we do not look for elaborate disquisition or learned criticism; but we expect, and justly expect, that it should be the result of very accurate investigation, and minute enquiry;—and

though it be not encumbered with erudite annotations, yet, that it admit nothing which may not be successfully vindicated. From almost every page of this performance, we are justified in the conclusion, that the author has not studied the scriptures. He has read them much, it may be; and no small portion appears to have been committed by him to memory: but the enquiries, on what occasion, to what persons, with what particular views, evan-

gelists or apostles have written, he seems not to have instituted. With what hope of satisfaction then can any one apply to this work for assistance, in examining the true nature and extent of christian doctrine? Mr. Robinson's system of faith, indeed, he will find amply detailed; but if the remarks we have offered be just, there is reason to doubt whether that be in every respect such as is taught in the writings of the New Testament.

ART. XII.—*Letters to the Rev. Thomas Belsham, on some Important Subjects of Theological Discussion, referred to in his Discourse on Occasion of the Death of the Rev. Joseph Priestley, LL. D. F. R. S. &c. &c. By JOHN PYE SMITH. Second Edition with some Improvements. 8vo. pp. 129.*

ART. XIII.—*A Vindication of certain Passages in a Discourse on Occasion of the Death of Dr. Priestley, and a Defence of Dr. Priestley's Character and Writings, in Reply to the Animadversions of the Rev. John Pye Smith; in Letters to a Friend. By THOMAS BELSHAM. 8vo. pp. 109.*

IN the discourse which has occasioned these letters and the reply, Mr. B. spoke of calvinism, as 'a tremendous doctrine,' adding, 'that had it really been taught by Jesus and his apostles, their gospel might truly have been denominated not the doctrine of peace and good will, but a message of wrath and injustice, of terror and despair.' He also further stated, that 'Dr. P. viewed calvinism as the extravagance of error, as a mischievous compound of impiety and idolatry;' to this he himself assented, and scrupled not in addition to call it 'a pernicious system.' In mentioning the controversy that had passed between Dr. Priestley and Dr. Horsey, Mr. B. had likewise said that 'notwithstanding the overbearing temper, and the great talents and learning of his adversary, Dr. Priestley was completely victorious.'

Provoked by these insulting words of

the Unitarian Goliath, Mr. S. (a young tutor at a calvinistic academy, though no calvinist himself) like another David, comes forth to check the insolence of the bold opposer of the armies of orthodoxy. But not with the skill, the prudence, or the success, of the shepherd youth. He disdains the sling and the stone, and demands a panoply. Encumbered with armour which he had not sufficiently proved, his attack is hurried, his blows are feeble, he seizes upon stations which he cannot maintain. When his strength is thus fruitlessly spent, the giant advances: fewer indeed are the blows he deals, but heavier and surer do they fall; and the stripling, though he owns it not, is vanquished. We cannot enter into the detail of this contest: our readers will be interested in perusing it for themselves.

ART. XIV.—*Ἀπερὸν Ἀναστασις; Or a New Way of Deciding Old Controversies. By BASANISTES. 8vo. pp. 194.*

THIS facetious controversialist has prefixed to his work the old motto—*ridentem dicere sermō quid vetat?*—and he attempts to refute the orthodox faith by what he deems a *reductio ad absurdum*.

Speaking in the assumed character of an adversary of 'Unitarian heretics,' he thus propounds the nature and design of his attempt.

"In this alarming period of prying research, when men, destitute of chivalrous sentiment, rudely examine the awful fane of orthodox devotion, and expose to unhallowed eyes the holy shrine of ineffable mysteries, it becomes a most necessary branch of religious prudence to remove our orthodoxy still farther

from vulgar apprehension, and to shelter it within more mysterious folds. The manner in which this pious work may be most effectually accomplished, is a question of considerable magnitude. To me it does not appear to be safe policy to give any ground to our adversaries, or to confine ourselves to defensive operations: but I apprehend, the surest way to preserve our orthodoxy inviolate, is to make bold and unexpected advances on the hereticks—to flash the coruscation of some new divinity against them, which, like the ægis of Minerva, shall petrify them with astonishment. Obvious as the wisdom of this conduct appears as soon as it is mentioned, yet I confess it was first suggested to me by the noble trope, so happily applied by a late most devoted servant to the priesthood, and

an admirer of orthodoxy: when the vessel of state was too heavy, and ready to sink on one side, he ran to the opposite side in order to preserve an equilibrium. In like manner, since Unitarians have run into the extreme of inculcating simplicity of worship, and since the world is so much inclined to side with them, that the catholic faith is in danger of being upset; the orthodox on the contrary, may create a counterpoise to the love of simplicity in the human mind, by adding to the objects of worship, and multiplying incomprehensible mysteries. In conformity with this captivating idea, I am happy to think that I can give them incalculable weight, by adding one to the two infinite minds or persons, with which they have already improved our notion of the Deity. By this unexpected device, I have every prospect of suddenly turning the scale, and of exposing the heretics aloft, in their turn, in a curious attitude. The Trinity thus will be a point gained, and a subject at rest, at least for many years; and the contest in future will be about the Quaternity, or some other nity.

"To secure this important advantage, most fortunately, I have no occasion for invention or ingenuity: I have only to search for the arguments of the orthodox since the time of Athanasius, a few of which will fully answer my purpose. I am also confident of an active support from the Orthodox, who cannot desert their own principles; though perhaps I can expect only a tardy cooperation from some very pious souls, who are smitten with a devout love for a triangle, and from some cautious politicians, who may be apprehensive lest they might destroy the decisiveness of a casting vote, by adding one to their odd number of divine persons. Against the prejudice of the former we shall find a remedy as we proceed; and let me here remind the latter circumspect gentry of an improvement, which has been made in most of our courts of law, in which one person has been added to the three on the bench, with manifest advantage to the public. But I have no great desire to weaken their attachment to odd numbers, provided they remove to a farther distance from a deistical unitarianism, and provided they include, in their scheme of orthodoxy, that person whom I shall now propose.

"The person, whose apotheosis I contend for, is the Jewish legislator: and I shall prove it to the astonishment of all heretics, by such arguments as the Orthodox will be proud to acknowledge for their own. 'There are certain attributes or perfections, which solely belong to, and characterize the Supreme Being: these cannot be ascribed to any creature: wherever we find these perfections as-

cribed to any being in the scriptures, we have the fullest assurance that such being is God; both because they are incommunicable in their own nature, and because God hath declared he will not give his glory to another, Isaiah xlii. 8. But these perfections are ascribed to the person whose apotheosis I contend for 'in the scriptures, therefore, he is very and eternal God. This I shall prove by the most clear testimony of God's word.* 'The instant this bold advance on the Unitarian is announced, all the truly Orthodox will reassume their courage, and will anticipate a complete triumph over our astounded adversaries. At the outset, I have extricated my party from a serious dilemma, in which the Unitarians vainly thought we should stick fast for ever. They have continually indulged their malice, by demanding from us in our distress, to mark out precisely some medium between Tritheism and Sabellianism†. This spiteful requisition is now impertinent, because we are no longer concerned about the former extreme: tetrathism should henceforward be mentioned in its place, which is infinitely removed from tritheism: and between this infinite accession of infinity and Sabellianism, it will be very hard indeed if we shall not be able to find out some medium. Many other pleasing prospects open suddenly upon us. If Unitarians are not past all feeling, we may expect that they will discover remorse, for having reprobated the Orthodox as polytheists and manufacturers of almighty persons, when I shall shew that the latter are to be blamed only for their great moderation in this manufacture. Our modesty is no less conspicuous than our moderation, since we have long enough contented ourselves with the title of trinitarians, which is held in great contempt by heretics, when we might easily have assumed the more sonorous and honourable title of quatuorarians."

Agreeably to the purpose thus expressed, our author proceeds sometimes in a delicate, sometimes in a coarse strain of irony, to apply to Moses some of the leading arguments which have been incautiously advanced to prove the divinity of Jesus Christ. Unitarians may be amused by this production, and confirmed in their reputed heresy, but serious trinitarians will be displeased at the manner, and not convinced.

The author himself is indeed aware—

"That the pious reader may sometimes wish, that this argument might have been carried on, without the free use of the most sacred name; but if he should perceive a fault

* Short defence of the doctrine of the Divinity of Christ by an anonymous author, published at Leeds. As I shall sometimes have occasion to quote this publication, which has received the highest encomiums from some of our first-rate writers, I shall call it in future—short defence.

† Sabellius taught that there is a plurality of moles or characters in the divine nature; but a unity of person.

in this respect, I believe he will not say that it rests with me, unless he should think it an unjustifiable proceeding, to repeat and submit to his censure those unworthy ideas of the nature of God, which are expressed in a few documents of great notoriety, and which are defended by persons, who set the greatest value on the form of godliness. On the contrary, he will perceive, that the real intention of my

argument is to cause the name of our Heavenly Father to be hallowed."

We have little doubt of his intention, but we hardly think it will be effected. They who cannot be reasoned out of their trinitarian faith, will not be laughed into unitarianism.

ART. XV.—*The Anti-Satisfactionist; or the Salvation of Sinners by the Free Grace of God: being an Attempt to Explode the Protestant, as well as Popish, Notion of Salvation by Human Merit, and to Promote the Primitive Christian Doctrine of the sufficiency of Divine Mercy for all who are Penitent: in Three Parts.* By RICHARD WRIGHT. 8vo pp. 412.

IT appears from an historical notice prefixed to this work, that it is published, chiefly, in consequence of a controversy, 'respecting the truth or falsehood of the notion of Christ's having made satisfaction for the sins of men,' which has lately appeared in a monthly publication entitled the universalist's miscellany, and in which Mr. Wright took a considerable part. Mr. Jerram, a clergyman in the establishment, was at length excited in opposition to Mr. Wright, and in the same miscellany, to defend the doctrine of atonement.

"I replied to Mr. Jerram (observes Mr. Wright) in a series of letters, which were inserted in the same work. To my answer Mr. Jerram did not think proper to offer any reply; though the magazine was still open to him. However he, in consequence of my reply, made some material alterations in his letters, suppressed some passages, dropped some reasonings, and substituted others, &c. In this improved state he republished his letters; but, though he availed himself of my reply in correcting and altering them, he carefully avoided dropping the slightest hint that any reply had been published. Hence I thought duty called upon me to republish my answer, that it might have a more general circulation, and that I might meet my opponent's arguments in their present form: but, judging it best to treat the subject more at large, I have penned the following work, which is now submitted to the examination of the public. Criticisms and references to the original I have as much as possible avoided, it being my wish to adapt my reasoning to the common reader: I have had recourse to these only when justice to the cause of truth seemed imperiously to demand it."

The author sets out with a few preliminary observations, in which he takes 'a general view of the way of acceptance with God, as taught by Moses and the prophets, by Christ and his apostles.' He then enters upon the great object of his work; first, stating the doctrine of satisfaction in the words of its defenders, such

as Luther, Calvin, various synods, confessions, and articles; Flavel, Baxter, Beveridge, &c. &c.; and placing in a parallel column such passages of scripture as he conceives afford a refutation of these. In a second chapter he attempts to refute the doctrine of satisfaction by argument. He next endeavours, with the assistance of Priestley's history of the corruptions of christianity, to account for the rise of the doctrine among christians, and its continuance to the present day; and in a fourth chapter, in answer to a question which he is aware may be proposed, what he would substitute in the place of this doctrine, he replies, the salvation of sinners by the free grace of God, and explains the terms of this reply.

In the second part of this treatise Mr. Wright enquires concerning the doctrine of atonement: he investigates the meaning of the term, the authority upon which its use in the English version of the new testament rests, and asserts, that it should rather be *reconciliation*. The doctrine of atonement he denies, and contends for that which teaches the reconciliation of men to God by means of the gospel. The letters originally published in the universalist's magazine, in reply to Mr. Jerram, follow. The writings of the old testament are then examined for the purpose of discovering what they teach concerning the death of Christ, and many remarks are offered on the fifty-third chapter of Isaiah; the object of which is to shew, that this, as well as every other passage of the Jewish scriptures, is totally silent concerning the death of Christ as a vicarious sacrifice. A few general thoughts upon the subject of sacrifices succeed, which throw no new light upon the much agitated questions of their origin and design. All the texts of the new testament, usually cited by the advocates of the doctrine of atonement, are then brought under a review: the

author is not content with 'a bare exhibition of them, though he thinks that would be sufficient to discover to the candid and serious enquirer after truth, how destitute their hypothesis is of plain and positive proofs;' but he gives a brief exposition of them according to his own system. As several of the offices ascribed to Christ have been supposed to favour the doctrine of atonement, our author proceeds to offer some remarks upon these. He enquires into the meaning of the terms mediator, surety, propitiation, advocate, and intercessor; he attempts to explain what is to be understood by Christ's being made sin, and a curse; by his agony in the garden, and his exclamation on the cross; and lastly, to prove that the phrase *for Christ's sake* is a mistranslation.

In the third part of his work Mr. W. very briefly enquires into the nature of the death of Christ, its design, and the connection which that event had with the dispensation of the gospel and the salvation of men.

We will enter into no controversy with this author upon the subject which he has thus discussed. That he is an opponent of popular creeds and confessions will be evident from the outline we have given of his work. Whatever may be the value of his arguments, we will bear our testimony to the general ability and the truly candid temper with which they are managed. We subjoin the following specimen:

"Satisfaction demanded implies injury received by him who demands it, and a capability of receiving compensation; but God is no more capable of receiving injury than he is of doing injury, or than he is of receiving benefit. Job xxxv. 6, 7, 8. 'If thou sinnest, what doest thou against him? or if thy transgression be multiplied, what doest thou unto him? If thou be righteous, what givest thou him? or what receiveth he of thine hand? Thy wickedness may hurt a man as thou art, and thy righteousness may profit the son of man.' Chap. xxii. 2, 3. 'Can a man be profitable unto God, as he that is wise may be profitable unto himself?—Is it gain to him that thou makest thy ways perfect?' Psa. xvi. 2, 3. 'O my soul, thou hast said unto the Lord, thou art my Lord; my goodness extendeth not unto thee: but to the saints that are in the earth.' As God is absolutely independent, above all influence, incapable of sustaining injury, or receiving benefit, from any one, it is impossible he should demand and receive satisfaction, or an equivalent for his favor to sinners.

"But it is argued that, though he cannot be personally injured, his justice was injured, and that it was his justice required satisfaction:

this affects not the argument; for what is his justice separate from him whose justice it is? Can justice, viewed abstractedly, be a person capable of acting and suffering, of receiving injury and compensation? The justice of any being is the rectitude of his conduct, the equity of his ways; and, surely, the rectitude of the divine conduct was not diminished, nor the equity of God's ways interrupted, by the evil actions of his creatures. Justice can neither demand, nor receive, any thing, but as some one demands and receives it in the name of justice; therefore to say that the justice of God demanded and received satisfaction is, in effect, the same thing as saying God himself demanded and received satisfaction. Sin is no where but in the creature, all its effects are restricted to the creature, and all the injury done by it is done to the creature: consequently, it is in the creature that reparation for the evil produced by sin is required: and this reparation can only be made by the restoration of the sinner to purity and happiness: in other words, by the removal of the evil from those who are the subjects of it: this is effected, not by an innocent person suffering in their place and stead, but by their reformation and recovery to the paths of rectitude.

"It may be said, though God is not injured by our sins, yet the good of the moral system is, the interests of our fellow creatures are; and consequently satisfaction was necessary. To this I reply, whatever injury had been done to the moral system it could not be repaired by the cruel murder of an innocent person, which is spoken of in the new testament as a gross violation of moral principle: there seems no way of repairing the injury done to the moral system, but by the reformation and future good conduct of those who have done it. However the interests of creatures may be injured by sin, it is not possible to compensate that injury by any thing but the amendment, and future right actions of those who have been injurious."

"Again, the notion of Christ's making satisfaction for sins establishes the doctrine of merit, yea even of human merit. Its advocates are continually talking of the merits of Christ, and that they expect all blessings from God on the ground of the merits of Christ: as if God would bestow no favor unless some one had merited it! Yet the phrase, merits of Christ, is not to be found in the new testament. It is fully admitted, that the merits of Christ stand very high with respect to us; we owe him the warmest gratitude and praise, as the medium by which all the blessings of grace and salvation are communicated to us; the favor which he manifested to us was great indeed: though he was rich, yet for our sakes he became poor, that we, through his poverty, might become rich; he sacrificed his own life to effect our salvation, and he still lives to carry on the work; but, however great his merits with respect to us, however great the obligations we are under to him, he never

claimed any thing of the Father, either for himself or sinners, on the ground of his merits, but received every thing as a free gift. His apostles never mentioned his having merited any thing at the hand of God, either for himself or others; but, on the contrary, they ascribe every thing he hath received, and every blessing he bestows to the gift of his Father; which is incompatible with the doctrine of satisfaction. Our opponents talk much of the merits of the death of Christ, as the only ground on which sinners have a right to expect salvation; and they sing—

‘Tis by the merits of his death
The Father smiles again;’

as if God would have been eternally frowning upon the world if Christ by his dying groans had not appeased his wrath, and induced him to smile on his own works. The merit of Christ's death must be human merit; for it was the man Jesus who died. Many of our opponents admit that it was the man, or human nature, only, that died. They contend that the same nature that sinned must make satisfaction for sin; but it was human nature

only that sinned. The merits of his death could only be the merits of him, or that, which died, which is acknowledged, even by our opponents, to be merely human; for, after all they say about the Godhead of Christ, they acknowledge that the Godhead could neither suffer nor die. Hence it appears that the merit of Christ's death is, even on the ground of our opponents, human merit: and it is by his death, they suppose, he made satisfaction for sins: it follows that the satisfaction scheme changes the doctrine of salvation by grace for that of salvation by human merit.”

Many like ourselves may be unable to assent to the interpretation which Mr. W. has given of several passages of scripture; but he is entitled to the praise after which every theologian ought to aspire, of having scrupulously weighed the meaning of every scriptural term which he produces in support of his system; and of having paid a strict regard to the connexion and original design of most of the passages which he has quoted.

SERMONS AND PRACTICAL THEOLOGY.

ART. XVI.—*Sermons by SIR HENRY MONCREIFF WELLWOOD, Bart. D. D. and F. R. S. Edinburgh; one of the Ministers of St. Cuthbert's, Edinburgh; and Senior Chaplain in Ordinary in Scotland, to his Royal Highness the Prince of Wales.* 8vo. pp. 480.

WE have already remarked that our list of sermons for the present year is more than usually long, but at the same time honourably distinguished by several valuable volumes. Among these, the labours of the rev. baronet justly deserve to be ranked; and if they have not any ‘peculiar’ they have certainly very powerful claims to the attention of the public. And we are persuaded that they will be ‘neither useless nor unacceptable’ to many who have not the felicity of belonging to the congregation among whom the author has laboured thirty years, for whom these discourses were originally prepared, and to whom they are now chiefly addressed. The character of this volume may be easily given. The subjects which the preacher has discussed are weighty and important—the manner in which they are treated is worthy of the momentous topics employed—grave, dignified, impressive—the style chaste, unencumbered with showy ornament—but not destitute of eloquence. ‘The doctrines and the duties of christianity are represented as inseparably united, in the faith and practice of those who embrace it;’ those doctrines which are in unison with the established creed of the church to which the preacher belongs, are in a few pages brought forwards, but not ex-

tensively: throughout the volume the author appears actuated by the maxim with which he concludes his preface—that ‘practical religion is of much more importance than the solution of difficult questions, and the sanctification and salvation of those who profess the gospel, than the soundest opinions.’

This volume comprises fourteen sermons, upon the following subjects: 1, On the unequal allotments of Providence; 2, On the minute improvement of the blessings of Providence; 3, On self-denial; 4, On the form of godliness; 5, On christian faith and morality; 6, On the result of good and bad affections; 7, On the inheritance of a good man's children; 8, On the doctrine of grace; 9, On the conduct of Providence to good men; 10, On the general spirit and effects of christianity; 11, 12, On the universal promulgation of christianity; 13, Prospects of futurity; 14, On the cultivation of personal religion.

Of these sermons, if we were required to select the most interesting and important, we should name the second, the third, the sixth, the seventh, the ninth, and the tenth. From one or two of these we shall subjoin some extracts, to justify the good opinion which we have expressed concerning this volume.

The subject of the second sermon is deduced from these words, recorded by John: 'Jesus said to his disciples, gather up the fragments that remain that nothing be lost.' And the preacher selects as examples to illustrate the minute improvement of the blessings of providence, suggested by these words: the fragments of the provision made for our temporal necessities; the fragments of our time; the fragments of our private comfort or of our personal advantages; the fragments of our health, or of our vigour. The two first of these are common topics, and the merit of the preacher, in discussing these, consists, as might have been expected, not in introducing new thoughts, but in placing old truths in a striking and impressive point of view. The two last, though not less important, have been, we believe, less generally noticed, and are here set forth with great ingenuity and force.

Having briefly but severely rebuked the temper which is generally manifested under the loss of blessings once enjoyed, the preacher proceeds thus:

"There is scarcely any situation in human life, in which there are not many comforts remaining, whatever the blessings are, which have been taken away. This is an unquestionable fact, though we were not to consider the cases, in which providence compensates by subsequent events, the heaviest calamities which we can experience. We may have lost what we valued as our best advantages, and may regret them with a degree of tenderness which supposes that their place cannot soon be supplied. We may have nothing more than 'the fragments' of our most precious blessings, which were once entire. But it is possible, that, by the grace of God, the faith which is purified by sorrow, may enable us to make more of 'the fragments' than we were able to attain by the full extent of our advantages. We are not to sink into despondency, whilst we are still permitted to enjoy many blessings, for which we give thanks to God: whilst in the use of them there is still a duty which we feel to be binding on us, a good work which we have still the opportunity of fulfilling, a service which we can still perform to those around us, or a good example, which the blessings which we still possess can enable us to shew them; or if, whilst 'we suffer affliction by the will of God,' there is still a friend who helps our infirmities, whose face we can cheer by our gratitude, or by our sympathy, or by our patience, or by our trust in God.

"If we are still capable of activity and of active duties, no deprivation of past satisfactions will justify our inactivity. Much less can it entitle us to indulge the despondency, which looks only to the grave. On the other hand, if we shall estimate at their true value

'the fragments which remain' to us of private or personal comfort, and shall use them faithfully, as the means of fulfilling the duties which we are not permitted to relinquish, they will grow or will be multiplied in our possession by the influence of God. If we shall persevere till we reap the result of them, one satisfaction will be added to another, and God may be pleased 'to bless our latter end,' like Job's, even more than the happiest part of our past time.

"No man can have a right to reject the advantages which are left with him, or to relinquish the duties which he can still fulfil, on account of the blessings which have been taken away. We may have good reason to regret that which we no longer possess. But as long as our probation lasts, much will remain after all that we can lose, which we are bound both to value, and to employ for discharging our indispensable duties."

Nor are the remarks under the last example 'the fragments of our health or of our vigour,' less forcible or important.

"Every man of understanding acknowledges our obligation to apply our talents to the business of human life, or to the ends of our probation for the world to come, as long as we are capable of exercising them. It is impossible seriously to doubt that our personal duties must be indispensable, as long as we have the means of fulfilling them.

"But when the doctrine is applied to practice, we are apt to take very different views of the subject. Though it is a truth fully established by experience, that it is best for every man, in the present life, and most for his advantage as an immortal being, to persevere in the active duties of his condition, as long as it is possible for him to discharge them; there is nothing which men more generally allow to dwell on their thoughts through life, than the idea, that a time shall come, long before they die, when they shall be able to relinquish their usual or professional occupations, and to spend the rest of their time, without labour or exertion, in the enjoyment of their private or domestic situations. Few in comparison are ever permitted to realise an idea, which so many allow to occupy their imaginations. Of those who are enabled to relinquish their labours, if their lives are prolonged, the greater part have reason to repent what they have done. By the change produced on their habits, and by want of use, their faculties are gradually impaired, as the sources of their activity are diminished; and they meet with chagrin and disappointment, where they expected to have found nothing but satisfaction or tranquillity.

"I do not say that those who have retired from the bustle of affairs cannot employ, and employ faithfully, 'the fragments' both of their health and of their vigour. They have certainly much in their power, if they consecrate their leisure to real duties, and keep their talents occupied as they ought to be;

much which relates to the discipline of their own minds; much which can be done in domestic life, for the advantage of the old or of the young, to whom they can give their attention or their time; much by which they can be useful to those whose characters they can influence, whose hands they can strengthen; whom they can assist in their difficulties, or comfort in their sickness, or furnish with the means either of prosperity or of religion.

"Those who apply the decline of life to such purposes as these, do not retire in vain from the bustle of the world. If they embrace heartily the opportunities of usefulness which they still possess, nothing is lost which they are capable of attaining. That which they do in secret for the glory of God, or for the advantage of their fellow mortals, is sanctified by the prayer of faith, and shall be accounted to them as good service, in 'the day of Christ.'

"But though I say this, I have no hesitation to add, that those who abide by their active occupations from a sense of duty, and who employ the last portion of their talents where they spent their vigour, have much better reason to expect, that both their usefulness and their personal comfort shall be continued as long as they live.

"No good man's conscience will suggest to him that he ought to become weary of his labours. He who delights in the service on which his duty or his usefulness depends, can have no wish to relinquish it. He is anxious to persevere in the duties which he can in any degree accomplish, even when he is conscious of his decline. He looks up to God, to whom he thinks he shall soon return; and though he knows that his summons to die cannot be distant, it continues to be the first wish of his heart, that he may be found employing the last portions of his health and life, in the duties of his proper place.

"A man who is able to preserve this happy temper of mind to the end, has a far better prospect, than other habits could afford him, of possessing the vigour of his faculties to his last hour; and therefore of extending his labours and his usefulness far beyond the ordinary term of human activity. He hears the voice of his master, urging his duties and his fidelity on his conscience, till his strength is gone: and he does not lose the impression of it, till the last spark of life expires."

In the tenth sermon preached in Edinburgh, before the directors for the asylum for the blind, the rev. baronet very ably illustrates this important doctrine—

"That relief to the miserable, and the general instruction of the poor, essential characters of the Messiah's reign, as described by the prophets, were leading and peculiar features of the gospel of our Lord Jesus Christ, as it was promulgated by himself and his apostles; that they have universally followed its progress, through all the ages and countries which it has hitherto reached;

and that, as well by means of those who have not believed, as of those who have sincerely embraced it, they have universally produced the most extensive and salutary effects, on the conditions of human life."

The whole of this discourse is deserving of the serious and attentive perusal of every unbeliever, and suggests many gratifying reflections to every enlightened disciple of Christ. Having shewn what was the aspect of christianity among the poor, during the personal ministry of our Lord, sir Henry justly observes:

"Before I attempt to trace its progress farther, it is necessary to remark, that both the distinguishing characters which I have supposed to belong to it were at this period almost entirely new to the world, and are not to be found either in the history or in the institutions of the ancient nations.

"We are not to suppose men of any age or country to have been destitute of the feelings of humanity, or incapable of exercising them. But those who are acquainted with human nature know well, how these may be controuled or perverted, by their superstitious, by their laws, by their inveterate prejudices, or by their general manners.

"There were virtues among the ancient nations which we read with a glowing satisfaction, and relate with pride and reverence. But their compassion for the helpless or the sick among the people, the kindness of the great to the poor, their provision for the old, or for the dying, among the lower orders, or their general sympathy with their conditions, were certainly not among their virtues. Setting aside what we find in the history of Judaism, there has not come down to us one trace or vestige of compassion to the miserable, to the sick, or to the dying, among the common ranks of the people, which was sanctioned by the religion, or by the government, or by the institutions, or by the general manners of any ancient nation.

"This fact is so well established, that a serious argument has been maintained in modern times, in defence of the ancient system of slavery, founded on the assertion that it held out to the great body of the people the only effectual security which they possessed, against the miseries of sickness, of famine, and of age.

"If this is in any respect a just view of the preceding ages, it is no wonder that it should be given us as a distinctive character of the Messiah's reign, that, as the great deliverer and restorer of our fallen race, he was every where to heal the sick, and gladden the blind, and bind up the broken heart, and 'to comfort all that mourn;' and that mercy to the miserable should be represented to be as much a peculiar, as it is a universal, character of the dispensation, over which he presides.

"The instruction of the great mass of the people, was a circumstance not less new or peculiar. The wisdom of the most enlightened

nations of antiquity was confined to the schools of their philosophers. Their religion was wrapt up in impenetrable fables and mysteries, which but a few individuals were allowed to examine. The knowledge which the people at large were permitted to acquire, was only calculated to rivet on their minds the terrors of the most abject, irrational, and depressing superstitions. While the art of printing was not yet discovered, and the people were effectually excluded from all the means of information, which have become so accessible in modern times, all culture and all real knowledge were of necessity confined to the higher orders of men. The instruction of the people could be no object of attention, and never was attempted. They were universally left to labour and to ignorance.

"We may no doubt recollect, that in the free states of Greece and Rome, a certain portion of information was inseparable from the spirit of liberty, and from the effects of the eloquence employed to work on the passions of the multitude, either in public trials or political contentions. But it is not difficult to form an estimate of all the useful knowledge, which can be traced to this source, which, in its best state, had certainly little influence to promote either the virtue or the happiness of the people. And if this kind of information is excepted, which was accessible to a very inconsiderable number of the human race, the people of the ancient world were effectually excluded from every source of instruction beyond the perceptions or the observations of an uncultivated mind.

"It was therefore no common attribute of public teaching, that it was given universally to all the orders of human life; and it was, of consequence, a character of the Messiah, as new as it was peculiar, that he preached the gospel to all the people, 'to the wise and to the unwise,' to the priests and to the slaves; that he preached it through all the land; and preached it to the lowest of mankind."

In that part of the discourse in which it is the object of the preacher to show that the relief of the miserable, and the instruction of the people, have distinguished the gospel from the first age of the gospel to the present times, we meet with the following passage; which we quote, not as containing any thing new, but as deserving of being frequently inculcated upon those, who, for want of due deliberation, are accustomed to undervalue the gospel.

"It is impossible to calculate the effects of the knowledge which was rapidly spread from Judea through all the world. 'The people who sat in darkness, and in the shadow of death, saw indeed a great light;' and the knowledge of the doctrine of salvation by the son of God, was followed by a thousand sources of light and information, from which the people had been effectually excluded in

all the preceding ages. Indeed, the effect of the promulgation of Christianity to all orders of men, to disseminate every other species of information, as well as its own peculiar doctrines, and its immediate and general influence on the manners and character of those who embraced it, cannot be either questioned or disguised, by those who have bestowed any attention on the history of the times. The emperor Julian, who renounced christianity, and who laboured, with indefatigable zeal, to bring back the people to the ancient superstitions, saw so much of the effects of the christian discipline, and of the regular instruction given by the ministers of the gospel to the great body of the people, that, with a view to give the same advantages to the heathen superstitions, he proposed a form of discipline, a system of public instruction, and even an institution for alms, after the model of the christian churches, to be adopted and incorporated in the temples of idolatry. No consequences followed from this design; for before the experiment could be tried, the emperor's death put an end to all his frenzy. The fact, however, is a demonstration from the mouth of an enemy, of the power and success, with which christianity was seen to have spread a general light and knowledge among the people.

"The corruptions in the christian church, which were imperceptibly multiplied, till they at last produced the monstrous usurpations of the church of Rome, gave the first great check to the general information, which christianity had diffused. After the people were no longer permitted to read the scriptures, and were confined to a worship performed in an unknown tongue, the human understanding was soon in worse fetters, than it had ever worn; and the ignorance and barbarism of the dark ages followed.

"On the other hand, it is a fact equally certain, that the reformation and revival of the christian church in the sixteenth century, was the signal of light and knowledge returning to the world. The general knowledge of the scriptures diffused among the people—the zealous and enlightened exhortations of the first reformers—the art of printing begun at this critical time—the books which the reformation produced and circulated—created a new era in the history of the world; and spread, more than ever, the sources of substantial information through every country.

"We have been more indebted for the superior light of modern times, and for the modern improvements in every art and science to the influence of christianity, and to the means of information which it has created; to the effects of its doctrines, of its spirit, and of its progress; than to all other causes whatsoever. 'The gospel, preached to the poor,' has added much indeed, to the resources, both of the rich and of the wise; and has done so, by preserving in its progress, the same general and peculiar characters with which it was at first promulgated by Christ and his apostles."

The eleventh and twelfth sermons, upon the universal promulgation of the gospel, contain many valuable observations; but we fear that the preacher has not accurately interpreted that passage of scripture—the 24th and 25th chapters of Matthew's gospel, upon which these sermons are founded. The events there predicted have, surely, all received their accomplishment; and once the gospel of the kingdom was published throughout the world. Infidelity has taken a strong hold

amidst the concessions which have been incautiously made on this and other subjects connected with these chapters; and she cannot be completely dislodged till those concessions be removed. Upon this topic no one has treated so ably as Mr. Nisbett, and we recommend his writings to the attention of the rev. baronet, and to all who are desirous of understanding the history of the founder of christianity, and the epistles of his earliest ministers.

ART. XVII.—*Discourses, chiefly on Devotional Subjects. By the late Rev. NEWCOMB CAPPE. To which are prefixed, Memoirs of his Life. By CATHARINE CAPPE. With an Appendix, containing a Sermon preached at the Interment of the Author. By the Rev. WILLIAM WOOD. Also a Sermon on occasion of the death of ROBERT CAPPE, M. D. with Memoirs of his Life. By the Rev. C. WELLBELOVED. 8vo. pp. 484.*

THE author of this posthumous volume was not altogether unknown to fame, though he retired from the public eye, and spent all his life in a distant provincial town, almost uninterruptedly occupied in the study of the scriptures. During the American war he published several fast sermons, which obtained for him the character of an eloquent and faithful preacher, and the admiration and esteem of many eminent persons. In the latter part of his life, when he was disabled by severe attacks of the palsy for performing the accustomed duties of his station as a minister, he gave to the world a series of discourses on the providence and government of God, which have been deservedly admired for the comprehensive view they take of an important subject, and the eloquent and energetic manner in which the practice of piety is enforced, and its consolations recommended. Since the author's death, two volumes of critical remarks and dissertations, on many important passages of scripture, have been published, which, however variously the novel principles that they contain may be appreciated, must be universally acknowledged to display great research, and great erudition, and to suggest, upon some topics, enquiries of no trifling and unimportant kind.

A more acceptable present could not have been offered than that which the judicious editor has here made to the public. From the memoirs of the learned author prefixed to the Critical Remarks, in which many extracts from manuscript sermons were inserted, as well as from former specimens of his talents as a preacher, we were prepared to expect that, should the editor be induced to publish a selection of

discourses from those which his patient industry had rescued from the oblivion in which they must otherwise have been buried, they would prove eloquent, pious, adapted to improve the understanding, to amend the heart, and to enforce the practice of holiness and virtue. Our expectations have not been disappointed. A volume, such as we ventured in the name of the public to solicit, is now before us; and we will assure our readers that, although the English press has teemed with the discourses of able and eloquent divines, it has sent forth few that can claim a superiority to those with respect to any excellence that ought to mark a work of this nature.

The editor has done wisely in prefixing to these discourses the very interesting and improving biographical sketch, originally drawn up for the Critical Remarks. A few alterations have necessarily been made, but none of them are of great importance.

The volume consists of *twenty-four* discourses. The three first are upon *faith*, which the preacher, with much ingenuity, demonstrates to be a reasonable, a desirable, and an important principle, not enthusiastic, nor independent of evidence, nor peculiar to religion; but a principle upon which the most contemptuous scoffers act in the commonest concerns of life—a principle suited to the wants and imperfections of the human mind, and introducing those who embrace it to the most delightful entertainments. The *four* succeeding discourses have been selected from a series which was composed and delivered by the author under the severest pressure of domestic afflictions, amongst which the death of an amiable partner,

the affectionate mother of six children, was not the lightest. Let the reader of these bear this information of the editor's in mind, and the pious lessons they inculcate will reach his heart with greater force. In the first we are taught the unreasonableness and the folly of undue anxiety respecting any future evils that may arrive; and, in the three that succeed, we are taught the duty of joining prayer with thanksgiving, under such afflictions as no anxiety has been able to prevent.

The exclamation of the psalmist, 'Lord I am thine,' affords the subjects of the *seventh* discourse, in which many useful reflections are suggested from this weighty and consoling truth, that *man is the property of God*. The *eighth* and *ninth* discourses are employed in describing the obligations, the importance, and the reasonableness of the love of God. In a very forcible and eloquent manner, the preacher proves that,

"The love of God is one of the most natural operations of the human heart, the most obvious and self-approved direction of its sentiments; for it is to admire, what is perceived to be truly admirable; to esteem, what is infinitely worthy to be esteemed; and to cherish in our hearts with complacency and delight, the idea of what confessedly deserves our supreme affection: it is, to cultivate a grateful sense of kindness that exceeds our tenderest thoughts, and of beneficence that passes knowledge.—To be devoid of the love of God, not only betrays an unnatural opposition to the dictates of self-love, and of charity; but also to that other powerful and amiable principle, by whatever name you call it, which recommends all moral goodness to our hearts. It implies a strange insensibility to our own happiness, to the happiness of our brethren, and to the noblest obligations; a criminal prostitution of our affections, and a perverseness and inconsistency of character, alike wretched, deplorable, and guilty."

But reasonable as the love of God is in itself, and essentially necessary to our own happiness, and the preservation of our virtue, the preacher is aware that there may be some difficulty in preserving and cultivating this divine affection: he therefore extends his enquiry into the causes from which this difficulty proceeds, and the means by which it may be best overcome. We regret that our limits will not allow of the copious extracts which we could with great pleasure select from these very valuable discourses. In some measure connected with these, are the four succeeding discourses, the most philoso-

phical, and, upon the whole, the most important in the volume. The subject of them is the *love of pleasure*, which is thus accurately defined:

"It happens that although we have names for many of our affections, significant of their general nature, significant also of the affection in its excess or its defect; yet, in very few instances are we provided with different terms whereby to distinguish it when indifferent, neither laudable nor blameable, from the same affection in its excess, in which, it is in one way criminal, or in its defect, in which it is criminal in another way. Pride, and anger, are two censurable passions; the one being the excess of that affection that is naturally excited by the consideration of what is worthy in ourselves; the other, the excess of that affection, which insults necessarily awaken. But, for these affections, in their general nature, in which they are indifferent; or in their defect, in which they are faulty, we have no appropriate terms. If we could speak of them accurately and usefully, we must describe them in several terms, and carefully distinguish them from pride and anger, which are the names only of the excess.

"From this narrowness of language arises much confusion in our ideas, giving birth to many prejudices, which in their effects may be hurtful to the comfort, and even to the good conduct of life; and hence it becomes necessary, to attend closely, and distinguish accurately, when either the nature, or the obligations of man, are the subjects of our meditation or discourse.

"For that affection, or rather for that class of affections which we comprehend under the denomination of the love of pleasure, we have only this single term to signify its general nature: we have no names to distinguish it according to the different objects it embraces, nor even to express its excesses or defects. Unless we enter into a particular description of them, we have nothing but this general term by which to express all these various sentiments, and all their different degrees. But it is obvious, that with regard to some objects of delight, our love of pleasure cannot be criminally weak, although in regard to others, it may be blameably defective; in respect to some sources of delight, it is not probable, it is not perhaps possible, that it should run into excess; in respect of others, it is very prone so to do; and there is hardly any class of pleasures, in respect of which there is not some degree of affection that is innocent, because natural and unavoidable: hence it follows, that what is true of any one thing, which we call the love of pleasure, is by no means true of all that we mean at any time by that name.

"The pleasures spoken of by the apostle, between which and the love of God we proposed to show you that there is a real opposition, are those which we derive from sensible and external objects. In respect of these, there are two different species of the love of

pleasure, which although, in the higher ranks of life especially, often combined, may however subsist apart, and when they do, they constitute two different characters; the one pursues the gratifications of a vain imagination, and forms the character of the giddy and the gay; the other, the gratification of the inferior appetites, and forms the character of the carnal and debauched. The hearts of the one, are in scenes of dissipation and amusement, and there is their sovereign enjoyment; the delight and desires of the other, are in scenes of sensual indulgence, in making or enjoying the provision they have made, 'for the flesh to fulfil the lusts thereof.'

The opposition which must necessarily subsist between each of these species of the love of pleasure and the love of God, is distinctly and forcibly marked, and a strong and affecting appeal is then made to the hearer, whether to the degrading and the dangerous love of pleasure he can consent to sacrifice the pure and satisfying love of God. We cannot withhold the following just and striking passage:

"If such solicitude, care, and attention, be needful to maintain and cultivate this divine affection, can it flourish, can it live in the hearts of the giddy and the gay? Will they, to whom thought is fatigue, who fly from amusement to amusement to save themselves from their own minds; will they be induced, will they be able, to abstract their thoughts from visible and external things; to fix them on God who is a spirit, whom no man hath seen or can see, and all whose excellences are spiritually discerned?—But what need have we to reason on the subject? Did ever any one expect to find a man of pleasure at his devotions? delighting in the opportunity of retiring to his closet; pleased to indulge the sacred sentiments of religion, and assiduously cultivating the love of God? Is it the men of pleasure that crowd our religious assemblies? Is it the men of pleasure that adorn our sanctuaries with a truly decent, and serious demeanour? with an appearance that betrays no constraint, no uneasiness, no impatient dissatisfaction, or indifference? Is it the men of pleasure that sanctify the day of God?—But it is not necessary in behalf of the doctrine I maintain, to multiply these inquiries; even with themselves I may lodge the appeal: it is no part of their pride that they are religious; this is a character that they are more apt to deride than to affect; they do not ordinarily even pretend to be devout.—Yet, my friends, suffer not yourselves to be deceived; let no man conclude that because he hath not fully arrived at the open contempt, or even at the total neglect of religion and religious ordinances, that therefore he is not a lover of pleasures, more than a lover of God. True religion cannot subsist with the love of pleasure, but the form of godliness may consist with and encourage it. The offices of devotion, both public and

private, may be performed, may be regularly and habitually performed from very different motives, and for very different ends. To nourish the spirit of devotion, to promote the love of God, they cannot be performed, where the love of pleasure is the ruling principle;—to deceive the world, to deceive the persons themselves, they may. Try your devotions: do you mean to be really religious, or to appear so? In reflecting on them, do you consider the fruits of genuine piety that have arisen out of them; or, are you more disposed to attend to the merit you think there is in them; and under the consideration of this merit, to excuse or to connive at those indulgences, of which you have at least some suspicion that they are not right? If it be so, your piety is irreligion, and however unwilling you may be to believe it, however averse to have others think so, you are indeed lovers of pleasure more than lovers of God."

The author then proceeds to specify some marks or signatures of that character in which the love of pleasure fatally prevails; and the whole enquiry concludes thus:

"My friends, you have much to do with God; yourselves and every thing in which you have any interest, are absolutely in his hands. You have far more important transactions with him than any that you are conscious of in this world; it will not be very long before the youngest of this audience will find it so. The time will come, I could tell the day beyond which it will not be deferred, but the day before which it will come, I cannot tell; the time will come when you will find this world vanishing away, and another opening upon you, this world of trial ending for ever unto you, and a sense of everlasting recompence commencing. You know as well as I do, would to God that you would let the idea sink deep into your hearts, that the round of this world's pleasures will not last for ever. The rose will fade, the eyes grow dim, and the heart grow faint, and all that is of this world become incapable of administering, even a momentary cordial or amusement. You know as well as I do, would to God that you would let the thought take possession of your souls! that the time will come when the warmest appetites will be cold, when the acutest senses will be dull, when the liveliest fancy will be languid, when the giddiest sinner will be serious, and the drowsiest conscience awake. The time will come, of which your preachers have so often warned you, when your bodies shall be undistinguishable from life dust that lies before the wind, and when that dust shall have as much interest in the gaieties and sensualities of those upon whom it falls, as you! Long before that time arrives, the day may come upon you, when, on a dying bed, while you watch for the moment that is to stop that beating heart, you shall look back upon the life that you have spent, and forward into the eternity that is to receive you. In that awful

season, whence will you derive your comfort? To whom will you apply yourselves, to pleasure, or to God? I have seen devotion triumph in the arms of death, but you need not wait until that awful period, to be perfectly persuaded, that pleasure cannot triumph there. It is not the remembrance, that you have loved pleasure more than God, that can give you confidence when you are entering into his presence: it is not this conviction that can comfort your attending friends: if you love them, if you love your own souls, let God have your first attentions, let your duty regulate your pleasures.

"The considerations that have been addressed to you, are considerations by which you ought to be impressed—you think so yourselves. Some of you, perhaps, are impressed by them. Cherish the impression. No artifice has been employed to fix any false impression on you. It is the simple truth that has been set before you, you will find it to have been such, ere long. Carry the ideas, carry the sentiments that have been suggested to you into every scene of pleasure into which you go; that you may never at any time be affected by such scenes, otherwise than you ought to be affected; that your pleasures may never be of any other kind, or of any other measure, of repetition, or concurrence, than is innocent and laudable; but being perfectly consistent with the spirit of devotion, and with all that the Lord your God requires of you, while you live may be pursued without remorse or suspicious, and, when you die, reflected on without apprehension or regret."

Some instances of very desirable effects produced by these excellent discourses have, we are told, already occurred, and we doubt not that they will be eminently useful in rescuing many from the fatal stream of lawless pleasure and of heedless gaiety.

To these succeed two discourses of a very ingenious and pleasing character, on the appearance of Christ, after his resurrection, to Mary Magdalene. In our progress through these, the object of which is to shew the causes of Mary's joy upon the unexpected discovery of her master and friend, we were fully convinced of the justness of a remark which occurs in the conclusion:

"That it is not a formal, careless, or cursory perusal of the sacred history, that can discover to us all its beauties, or let in its just impressions to our hearts. This can be attained only by attentive meditation, and reiterated reflection on the scenes and circumstances of the events, and on the feelings and language of the agents. Without this, many of the beauties of the sacred story will lie hidden from us, and therefore many things that might have confirmed our faith, and through that, our virtue, as well as many things that

might have exercised the good affections of our hearts, will remain undiscovered."

The same remark is admirably illustrated in the three following discourses upon the words of the angel at the empty tomb, 'Come see the place where the Lord lay.' From these words Mr. Cappe has suggested many new and beautiful thoughts, and derived no weak additional evidence to that of which we were before in possession, of the reality of that event upon which the faith and hope of the christian are built.

The *nineteenth, twentieth, and twenty-first* Discourses are on David's Morning Hymn of Praise. The 19th Psalm is well explained, and the glory of God, as displayed by the heavenly luminaries, is pleasingly illustrated. The *three concluding* Discourses are of a very peculiar and very interesting kind. They are entitled, *On the Use and Improvement to be derived from severe Illness*; and were composed and delivered by the author, 'on recovery from a fever, by which he had been confined to his bed several weeks, and his life despaired of many days.' Many extracts were given by Mrs. Cappe, in the first edition of her Biographical Sketch: it is therefore unnecessary for us to say more respecting these impressive discourses. We cordially join her in the hope and the expectation that many yet unborn may profit by the labours and the example of this excellent author, and thus have cause to join their thankfulness to that of his family and connections, for the recovery which enabled him to suggest such awakening and important truths.

One excellence in this volume we must not omit to mention, and to recommend to the notice of those who publish sermons for the use of families: a short prayer is added to all except the two last discourses, suited to the general train of thought in the discourse to which it is affixed. Much pious sentiment is found in these prayers, expressed in simple and impressive language.

We cannot take leave of this volume, by which we have been so much interested, and we hope improved, better than in the words of the editor herself:

"It is true, indeed, that a spirit of devotion is not the spirit of the times; yet some persons, surely there are, who wish to discriminate accurately between sterling piety, which leads to every thing great, and noble, and consolatory, and that wild enthusiasm which erringly assumes its honoured name—some, who would wish to keep strictly within the bound-

days beyond which, pleasure, even innocent pleasure, assumes a different character—to

persons such as these, the Sermons here presented to them, cannot be without their value."

ART. XVIII.—*Discourses on various Topics relating to Doctrine and Practice. By the late Rev. T. KENRICK. In two Volumes, 8vo. pp. 391 and 373.*

THIS, like the preceding, is a posthumous publication, of considerable value; the work of a well known and very respectable character amongst that class of protestant dissenters, which is distinguished by the title of Unitarian. It appears in consequence of a request preferred to the author's widow, by the congregation of which he had been long a pastor, and which, upon his unexpected death, was desirous of having some durable memorial of his virtues and his talents.

"The object (observes the editor) proposed in the selection of the discourses which compose the two volumes now laid before the public, has been, not to form a work which might recommend itself to any religious party, by favouring its sentiments exclusively, but, as far as possible, to exhibit the opinions of the author, whether they concurred with those of others, or not. Every man, who thinks for himself, is likely to differ in some points of importance, even from those with whose views his own may, for the most part, coincide, and with whom he may, therefore, be commonly ranked by some discriminating appellation. Mr. Kenrick *did* think for himself; nor did he hesitate to declare the result of his reflections on all proper occasions. It would not therefore have been to do justice to his character, to have kept back any of his discourses, merely because they were distinguished by sentiments widely differing from those which are embraced by the majority of christians. In no one instance has this been done."

The general character of these volumes will be apparent from these remarks by the editor. The greatest part of the discourses are doctrinal, and the doctrines which they are intended to recommend are such as are usually deemed heretical.

The first Discourse is entitled 'The Value of Truth and Danger of Error,' and abounds with forcible and important observations. The three following are 'On the State of the Dead;' the design of which is to prove that there is no intermediate state of consciousness between death and the resurrection; and that all our hopes of a future life depend upon that great event. The preacher's reasoning, though often specious, is not always conclusive; and in these discourses he has clearly shewn that they who insist so strenuously upon the necessity of a scrupulous adherence to the exigence of the place, and a minute examination of the genuine import of the phraseology of passages of scripture upon which any doctrine is to be

founded, are themselves too prone to violate the principles of interpretation which they wisely recommend. A dispassionate enquirer will find many texts quoted in these discourses without that strict regard to their terms and situation which so important a subject as is here discussed required.

In two succeeding sermons the character of Paul is ably vindicated from the charges of Mr. Paine; and in the seventh sermon, the epistles of that great apostle are defended against the attacks of the same rude champion of infidelity. Mr. Paine's groundless invectives against the gospel, and its earliest preachers, are now, we hope, and believe, despised or forgotten; but these discourses will be always valuable as a vindication of a truly exalted character, and as establishing this fact, that the arguments employed against christianity often betray a total ignorance of the subject on which they profess to decide; are confident assertions without proof; or, if they preserve any appearance of argument, are shewn, by a little examination, to be wholly inconclusive.' (Vol. i. p. 98.)

The destruction of the seven nations of Canaan is explained and vindicated in the eighth sermon, upon the principles usually received.

The ninth sermon, on the religious instruction of children, is highly judicious and deserving of the serious attention of parents. This is followed by one, in which the preacher endeavours to enforce the practice of giving the Lord's supper to children. Mr. Pierce and Dr. Priestley were strenuous advocates on the same side. A valuable part of this publication succeeds. 'An Inquiry into the best method of communicating religious Knowledge to young Men;' with, 'An Address to young Men at the conclusion of a course of Lectures upon the Evidences of natural and revealed Religion, and upon other important Branches of religious Knowledge.' To ministers and young persons out of the pale of the establishment, a serious perusal of these cannot be too strenuously recommended.

We gladly transcribe the following passages from the address:

"It is a truth, which cannot be too strongly inculcated upon young persons, that a regular and frequent performance of the exercises of devotion is particularly necessary for them; upon this plain principle, that the less there is

of a devotional spirit, the more cultivation it requires. Those who have long performed these exercises with proper attention, who have acquired just notions of the Divine Being, and impressed them deeply upon their hearts, may almost venture to trust themselves to the habits they have already formed: these will dictate to them such a temper and behaviour towards God, upon all occasions, as it becomes human creatures to maintain, or at least tend to strengthen and confirm the dispositions they have already acquired. The occasional omission of a religious exercise will do them comparatively little injury; but to young persons it may be of fatal consequence: by preventing them from forming a devout habit of mind, and thus leaving it to be exposed, unincultured with religion, to the corrupting influence of the world. Be constant and punctual, therefore, in observing the exercises of devotion. Avoid the practice of attending public worship one part of the day only, and still more the pernicious custom of spending the whole of the Lord's day at home, in business or amusement: a custom which, if it were to become general, would do much towards banishing all serious piety from the kingdom. You have need of all the assistance which you can obtain, and cannot neglect any without losing an important benefit."

Speaking of books, Mr. Kenrick observes:

"But I must caution you to beware of spending much of your time in a species of reading, which is very captivating to young persons, and in which the publications of the present day afford them abundant opportunity of gratifying their inclinations. I refer to such books as come under the description of novels and romances. That fictitious characters may be so exhibited, as to afford useful instruction, cannot be denied. Virtue may be drawn in such just and strong colours, as to engage our esteem and admiration; and vice represented so odious, as to excite disgust and abhorrence; impressions, which are certainly calculated to make us cultivate the one, and avoid the other. But when vicious characters are endowed with the striking qualities of genius, courage, generosity, and pleasing manners (as is generally done, in order to render them interesting), these qualities lessen that horror, which we ought to feel, at the sight of great crimes, and tend to impair rather than strengthen virtuous feelings and habits. To say that characters of this kind, in which some of the worst vices are united with many excellences, are natural, that is, occur in real life, is indeed to assert no more than what is true; but yet that does not destroy the force of my objection; for they are not characters with whom any one, who has a regard to his own moral improvement, would choose to have frequent and intimate intercourse; and what is injurious in real life, must be so, in some degree, when exhibited in fable. If, besides producing this evil, these writings give men false ideas of human life, and encourage ex-

pectations of happiness, which can never be fulfilled; if they exhibit such scenes to the imagination, as tend to inflame passions, commonly too violent already in young persons, they become still more exceptionable.

"The objections just mentioned hold, with still greater force, against the entertainments of the theatre; because the language and the characters are more licentious, and being a nearer resemblance of real life, are better calculated to make a strong impression upon the mind. Both species of amusement, although capable of being employed for useful purposes, are generally so conducted as to have an unfavourable influence upon the virtue and happiness of mankind. I cannot, therefore, help considering those who read novels, or see plays indiscriminately, as in danger of having their morals corrupted, and by some of them in no small degree.

"They, who are pleased with the history of individuals, will find a more useful, and not less agreeable employment, in reading the lives of men, who have taken a distinguished part in the business of life, and were, at the same time, eminent for their piety and virtue. Particularly in reading the lives of those who have endured great calamities, on account of their religious sentiments. The unparalleled sufferings of these men excite our compassion, and the deepest abhorrence of those pernicious principles and passions, by which they were occasioned; while the fortitude and magnanimity, the meekness and patience with which they were borne, fill us with admiration, and prepare the mind for passing through life's scenes with the same temper; or, although similar trials should never occur to call for the exercise of these virtues, they tend to moderate our regard to the world, to which Christians are liable to be too much attached, in seasons of tranquillity and peace. Many illustrious examples of this kind you will find in the history of the puritans and non-conformists in England; among the protestants throughout Europe; and among the primitive Christian martyrs, in every part of the world. Brave and generous spirits, ye were the undaunted advocates of truth; the ornaments and glory of human nature; the greatest benefactors of the human race; all ages will read your history with admiration, and your examples will inspire the heart with virtue to the latest generations."

The thirteenth sermon treats upon the much disputed subject of natural and moral evil with reference to the infinite benevolence of the Deity, with which the preacher shows the permission of evil is not at variance. In the fourteenth sermon, the scriptural phrase 'remission of sins,' is explained, with no little ability, upon unitarian principles. The four following sermons, on 'Good Motives,' deserve the attentive consideration of the unbeliever. The motives which Christ and his apostles proposed here shewn to have been, love of pro-

and fear of censure; rational self-interest; benevolence to men; and a regard to God.

"We see then," observes our author, after a very accurate examination of this important subject, "that Christ and his apostles recommended to men their duty by motives, which are not only rational and powerful, and therefore adapted to their purpose, but by such also as tend to improve and exalt the characters of those, who are under their influence, to raise them from one degree of virtue to another, until they attain the perfection of human beings, from the love of praise, and the pursuit of self-interest, to the practice of benevolence, to a regard to God and to conscience. From both these considerations, therefore, we may justly infer the excellence of the instructions which they delivered.

"If we compare the mode of instruction pursued by them, with that which was followed by other teachers, we shall perceive their superiority. The precepts of morality made no part of the heathen religion, nor did their priests enjoin the practice of it as necessary in order to procure the favour of their divinities; every thing that was requisite they represented as consisting in the performance of some trifling ceremony, which had no connection with virtue. Their philosophers, indeed, delivered some excellent sentiments on the subject of morals; but the motives by which they were enforced, were founded upon present self-interest, the good of society, or the good of their country. The grand motive to a good life, to be derived from the doctrine of future rewards and punishments, and from the belief of an Almighty Being, the present witness of our actions and our future judge, were left out of their system. What feeble obstacles to the violence of headstrong passions other motives afford, in comparison with these, I need not attempt to prove.

"It may now be asked, how came Jesus, who was only the son of a carpenter, and himself a carpenter, or his apostles, several of whom were fishermen, so well acquainted with human nature, as to know what motives were calculated to reach the human heart, and to give the greatest authority to those which deserve most weight? Or, if natural discernment taught them this, which is very unlikely, considering that they had escaped the discernment of the wisest philosophers; how came they, if they were impostors, to inculcate upon their followers the practice of disinterested benevolence, and to teach them, above all things, to respect the rights of conscience, and the will of God, about which impostors give themselves no concern? How came they to enjoin a contempt for worldly pleasures and honours, and for a temporal interest, and to direct us to fix our principal regards on the happiness of a future life, which happiness is to consist, not like the paradise of Mahomet, in sensual delights, but in the society of the virtuous, and in serving God with improved power? When they promised honour to those who complied with their precepts, why was it

honour from the few accompanied with disgrace from the multitude? This was surely not to act the part of impostors, who endeavour to suit their doctrine to the taste of their hearers, and who, having in view temporal and present rewards themselves, propose them to others. This conduct can be accounted for only upon the suppositions that the religion which they taught came from heaven, and that they were instructed by God himself in the motives by which it was to be enforced. If you set a value upon the best means of your improvement in goodness, you will not suffer such a religion to be easily wrested out of your hands."

The nineteenth sermon treats of the observance of the sabbath, and is distinguished by its piety no less than its entire freedom from austere and superstitious notions: and the volume concludes with a brief view of what the author deemed incontrovertible evidence of the humanity of Christ.

The second volume opens with a sermon on Public Worship; in which that practice is very ably defended. Many useful observations are found in the four following discourses: On the Fear of the Lord; the Moral Sense; against Indifference to Religious Truth; and Christians the Salt of the Earth. The twenty-sixth sermon, on the phraseology of the epistles, is a useful epitome of Dr. Taylor's key to the apostolic writings. The seven discourses which follow, are upon the doctrine of atonement, and were delivered originally as lectures to a class of young men. They are entitled, Repentance and Reformation only required in order to acceptance with God. On the design and ends of the death of Christ. The nature and design of the sacrifices of the Mosaic law explained. The figurative language applied to the death of Christ in the New Testament explained. The doctrine of Christ's atonement inconsistent with reason. On the language applied in the New Testament to the death of Christ. And inferences from the falsehood of the doctrine of atonement. It is acknowledged in an advertisement prefixed to the first, that in various places of these the author has closely followed the essays on the death of Christ, &c. published by Dr. Priestley, under the name of Clemens, in the Theological Repository. To these succeed seven sermons of a miscellaneous nature. On the necessity of providing a subsistence for public instructors, preached in aid of a collection for the support of dissenting ministers in Devonshire and a neighbouring county. Against persecution for religious opinion.

On the future existence of infants; printed before, but now published for the first time. On the value of life, and the lawfulness of wishing it terminated. On the danger of bad company, which contains several cautions that may prove highly useful to the young. A sermon preached before the western unitarian society: and Paul's valedictory prayer explained and improved.

Such are the subjects, which in these volumes are presented to the notice of the public. Their value will be variously estimated, according to the measure of orthodox faith which may have fallen to the share of their various readers. Unbiased by any partiality for the author or his opinions, or any undue attachment to

such parts of our own creed as he may have opposed, we hesitate not to avow that we have found in these discourses many evidences of an enlightened understanding, an extensive knowledge of the scriptures, and a spirit of rational piety. To the unbeliever they suggest many striking proofs of the truth and value of the revelation he contemns; to the young they offer many salutary and instructive lessons; to the advocate of established creeds, they exhibit a pleasing demonstration, that some good thing may still come out of Nazareth; and in the breast of those whose sentiments are here vindicated, they will awaken the regret which must have been felt at the loss of so zealous and able an advocate.

ART. XIX.—*Sermons on various Subjects.* By the Reverend JOSEPH TOWNSEND, M. A. Rector of Pewsey. 8vo. pp. 384.

IT was the intention of the venerable author, as we are informed in the preface, "to have reserved the publication of these discourses for his executors. But lamenting to see that the progress of infidelity, and the morals of the age, are such as to call loudly for the zealous exertions of all the friends of religion, piety, and virtue, he resolved to lose no time in committing his thoughts and admonitions to the press. They were composed more than twenty years ago, but constant occupation prevented their receiving those last touches, which were required, before the author could venture to submit them to the inspection of the public." Pref. p. v. vi.

The volume is small, and the subjects of investigation are few; but we recommend it as containing much important instruction, and peculiarly worthy of the serious regard of youth. Would they but listen to the counsels of age and experience which are here offered, infidelity would not be so prevalent, and the vices of the age would be checked.

The first sermon is, on the being of a God. In this the preacher exposes the absurdities of atheism; suggests many arguments to prove the existence of an intelligent first cause, drawn from the works of nature; and deduces from the subject some good practical reflections. The second and third sermons are on the moral law. They are designed to shew that there can be no consistency of conduct, no stability in virtue, without respect to the laws of the Most High. These are somewhat diffuse and declamatory.

In the two succeeding sermons, on the gospel, the preacher demonstrates by an appeal to the systems both of ancient and modern philosophers, that no satisfactory knowledge concerning religion can be obtained without the aid of revelation. These discover much ability. We transcribe the following passage from the fifth sermon:

"What then is the boast of human reason, and where shall philosophy begin her triumph?"

"Let the impartial judge then tell us what advantage the wise and learned of this world have acquired over the humble disciples of the despised Jesus. If they have no advantage, what occasion can there be to warn the christian against philosophers? Is it presumable that he should be plundered of his hope by men who have no hope to animate their zeal, and no certainty to guide their steps? It is at least possible; and the danger to be apprehended may be imputed, either to insatiable thirst for knowledge, to vanity and self-conceit, or to inordinate desire of literary fame. "Ye shall be as Gods, knowing good and evil," was the first and prevalent temptation; and from that fatal hour, whilst the way to the tree of life hath been almost deserted and untrodden, philosophers have been crowding round the tree of knowledge, and contending for its fruit.

"The desire of information cannot properly be considered as the source of error. But when, impatient to be confined within the bounds which the God of nature hath established, men, eager in pursuit of science, quit the province which belongs to reason, and follow their speculations, where they can derive no assistance from revelation, they must wander widely from the truth. As long as they confine their inquiries to numbers and to quantity; as long as their researches relate

only to those sciences and subjects, of which reason is competent to judge, they will arrive at certainty; and the justness of their conclusions will be universally acknowledged. Beyond this all is darkness, conjecture, and dispute. Where reason is competent to judge, the whole earth is of one language; but when, without authority, men attempt to build a tower, whose top may reach to heaven, all is confusion, and the wisest appear to be void of understanding.

"Optical deceptions in the two extremes of vision, are not more frequent than those of the mind, when it is stretched to the full intensity of thought: when we are to compare ideas, which are distinct and clear, we may safely draw conclusions: when they are obscure and faint: when the mind can scarcely grasp them; when it is either confounded at every step by ill defined resemblances, or unable to acquire ideas that are complete and comprehensive; we should suspend our assent, and rest satisfied with doubting. When the cloud thus remains upon our tabernacle, like Israel we should continue in our tents.

"Through the long period of revolving ages much hath been added to the common stock of science, innumerable facts have been ascertained, and from them, as far as relates to the material world, most important deductions have been made; yet we may venture to assert, that, as to invisible and eternal objects, independently of revelation, we can boast no such progress, nor is one cloud removed which hung over the head of our most remote progenitor."

To these succeed eight sermons on *temptation*. In these the progress of temptation, the means of avoiding, of resisting, and of passing through it, are represented with much ingenuity and force. These discourses might have been compressed, perhaps, with advantage, and their effect would still be increased were the arrangement which the author has with judgment adopted, more clearly pointed out to the ordinary reader; for the weighty truths they contain, and the forcible manner in which these truths are proposed, they deserve unqualified commendation. The following passage, which exhibits a fair specimen of the whole series of these discourses, will prove to our readers that the judgment we have pronounced is not erroneous:

"To avoid temptation, men of virtuous principles must be careful upon all occasions to appear what in reality they are. It is not necessary that you should assume peculiar severity of manners, nor that you should make a wanton display of your religious principles: but that, if you are indeed a friend to virtue, you should never upon any account put on the disguise of cold indifference to its interests, and much less should you affect to be a friend

to vice. Whilst you carefully avoid ostentation and hypocrisy, take heed that neither false modesty nor the fear of ridicule betray you into mischief. If religion be a cheat, renounce it; if it be true, be not ashamed to own it, nor afraid to manifest the most inviolable attachment to its precepts.

"A word, a look, on some occasions, are sufficient to encourage or to check temptation. Few men have lost all regard to character, nor will they venture to proceed, till they have felt their way; more especially if any doubt remains upon their mind of the temper, principles, and disposition of the person whom they mean to gain. Guilt cannot meet the eyes of innocence, but, covered with confusion, shrinks back, when in danger of detection, and then either returns to the assault with greater caution, if encouraged to proceed, or, if confirmed in the opinion, that your virtue is not to be corrupted, makes a precipitate retreat. Only for a moment let your conduct be inconsistent with your principles; understand by signs, and by signs parley with sin; or discover the least degree of hesitation, and the tempter will advance with the confidence of victory. None but the most profligate and hardened wretch, void of understanding, and lost to all the feelings of humanity, can propose a base and dishonourable action, without he has some reason to imagine that his proposition will be accepted. But, when you shall have lost your reputation for integrity, no one will take the trouble to speak darkly. No: when inclined to the commission of a crime, he will without reserve or fear make known his purpose, and urge you to be a partaker of his guilt. Had Job maintained a character for virtue, or had he been known to regard his honour as a soldier, he had not been called upon to execute the base and execrable purpose of his sovereign.

"A character for religious principle will be a strong bulwark against the assaults of sin, not only as keeping the wicked at a proper distance, but as operating on that laudable kind of pride which naturally is found in every breast, the pride of character, the sense of dignity, discovered in regard to the good opinion of mankind, which is only to be secured by consistency of conduct. Suppose that your reputation stands unimpeached; you must of necessity desire to preserve it spotless: but if it be lost and past redemption, you will be indifferent to the good opinion of the world, and will bid adieu to shame. Banished from the society of those whose virtue might reclaim you, and condemned to pass your time in the miserable haunts of impiety and vice; exposed continually to sin, and hardened by the bad examples which surround you, you resemble the unhappy lepers of Carthage, in New Spain, who, without distinction of rank or fortune, are thrust out of the city and compelled for ever to associate only with those loathsome objects, who are infected by the same disease. (Uloa, B. 16. 5.)

"Supposing that your character is not past

redemption, but only wounded; yet your powers of resistance are thereby considerably weakened: for how can you at any time plead regard to conscience, when your conscience is known to be occasionally subservient to your evil inclinations? Nay, do but manifest in a single instance that you can violate its dictates, and you will be ashamed to urge it as a plea for not complying with the desires of either friend or patron, from whom you have any thing to hope or fear."

The volume concludes with two sermons on the leaven of the Sadducees and Pharisees, designed as a caution against infidelity and sensuality on the one hand, and hypocrisy, spiritual pride, selfishness, and other crimes of the ancient Pharisees, on the other.

In the preface to this very useful volume, we are informed that, with the same view of leading men to the practice of virtue and the knowledge of truth, the author is now preparing for the press *Observations on the Character of Moses*, as an historian, as a lawgiver, and as a prophet.

"This work will embrace a variety of interesting objects.

"As an historian, Moses displays the work of creation in its progressive stages, till it terminated in the formation of the human race. He gives an account of our fall from a state of innocence and virtue to the most abject condition of depravity and vice. He describes an universal deluge; he speaks of the dispersion of mankind, and affirms, that, prior to this event, the whole earth was of one language; he represents to us the simplicity of manners which prevailed in the pastoral ages, the nature of the patriarchal government, and the introduction of sacrifice, with other religious observances universally prevalent from the most remote antiquity.

"These subjects lead to geological discussions, and to the examination of the various

languages which are spoken in Europe, Asia, Africa, and America.

"In his geological discussions, the author has examined the several strata which appear in every part of Europe; but he has paid more particular attention to such as prevail in Britain, and has described their usual succession, range, thickness, dip, and dislocations, the materials of which they are composed, with their extraneous fossils, and the useful purposes for which these materials are adapted, the nature and extent of springs, and the regions to which both coals and mineral productions are confined.

"In his examination of languages, he has selected 3,600 words, in English, all monosyllabic, as being most ancient, and these he has compared with corresponding expressions in three score languages, in order to demonstrate that they all originate in one. This part of his work may be considered as a key to the languages of Europe, because, to any person who is intimately acquainted with one of these, it facilitates the acquisition of all the rest.

"The first part of his work is almost ready for the press, and will appear in one quarto volume. It has occupied twelve years of close application and unremitting attention. Indeed, the whole bent of his studies, for more than half a century, may be considered as having been directed to this object, because it has been constantly preparing him for the undertaking.

"Whenever that volume shall appear, it must not be considered as incomplete without the succeeding volume, because it will thoroughly investigate the character of Moses as an historian, which has no dependance on what is meant to follow, respecting his comparative merit as a legislator and a prophet. In a word, it will stand like the principal and central portion of a vast edifice, to which the wings may be occasionally added to compose one whole."

We look for the appearance of this work with some degree of impatience.

ART. XX.—*Sermons Preached to a Country Congregation. To which are added, a few Hints for Sermons, intended chiefly for the Use of the younger Clergy.* By the late WILLIAM GILPIN, M. A. Prebendary of Salisbury, and Vicar of Boldre, in New Forest. Vol. IV. Published by his Trustees for the Benefit of his School at Boldre. 8vo. pp. 423.

MR. GILPIN's character as a plain and serious preacher, has been long known and highly esteemed; and the well earned reputation which he enjoyed during life, as a faithful parish-priest, will not be diminished by this posthumous volume, prepared by himself for the press. Regret, indeed, will be felt that this has closed his labours; and an ardent wish will be excited in the breast of every reader who wishes well to his country, and to the gospel of Christ, that the Lord of the har-

vest would graciously send other such labourers into his harvest.

The first sermon in this volume was preached before the bishop of Winchester at Southampton in the year 1788, and has already appeared in print. The object which the preacher had in view was to enforce upon his reverend brethren the study of the scriptures; and many judicious and many candid remarks occur. The following is not the least deserving of notice in an age too much distinguished

by a bigoted attachment to metaphysical theology :

"Thus again, with regard to the other important subject, on which I touched, as there are many passages of scripture relating to the humanity of Christ as well as his divinity, I cannot persuade myself, (as some pious people have done), that an *exact* faith on this head is necessary to salvation. Numbers, I have no doubt, will be saved through the merits of Christ, who conceive him only as their law-giver, and conscientiously obey his laws; though they may not have those exalted ideas of his divine nature, to which our scriptural rule, I think, so directly leads. If their holy lives have attained the principal end of a better faith, they ought not surely to be branded with hard names, and considered among those who *deny Christ before men*.

"We are sometimes told they ought; because without this exalted faith in the divine nature of a saviour, the mind cannot attain those elevated heights of love, which the gospel prescribes.—One should think so indeed: but before we pass these harsh censures on others, let any of us, who do hold that doctrine, ask our own carnal hearts, whether it purify them in this exalted manner?"

The second sermon preached at a visitation, has also appeared before the public. The republication of it is well timed, and we are persuaded that if our clergy would attend to the admonitions which are here delivered, they would secure respect to themselves, and lessen the influence which ignorant and fanatical preachers so fatally possess.

Thirteen sermons follow upon important practical subjects, all distinguished by excellent maxims of conduct, enforced with great seriousness, and delivered in chaste and simple language, level with the capacity of every rustic hearer, and adapted to make its way to the heart. We could select, if it were necessary, in proof of the justness of the character which we ascribe to these sermons, and for the pleasure and improvement of our readers, many such passages as the following :

"Our aptness to deceive ourselves proceeds entirely from self-love. If it was not that we love ourselves better than our neighbour, we should be as quick-sighted to our own faults as we are to his. But self-love blinds us. As parents are blind to the blemishes of their children, and screen them often under harmless names, so are we blind to our faults, and have a thousand excuses for them, which neither shew their nature nor our guilt, but merely our own self-love.—Perhaps all your neighbours know you lead a selfish life: you spend much of your time, and much of your money, in company and liquor; you lose your business, as few people

care to have dealings with a man who can be so little depended on: your family suffers: in short, you have made yourself a very contemptible fellow. Yet still you stand high in your own esteem. You have your excuses always ready. Perhaps you can afford to spend your money; so that you injure nobody but yourself; as if the kinder God is to you, the more right you have to squander what he gives. Or perhaps, though you may have been sometimes guilty of a little excess, yet it has been very seldom, and never without a good reason: you were fatigued, and wanted a little refreshment; or, you just stepped in to talk with a neighbour on business; or, in short, there was something which makes your offence very trifling in your own eyes, though the real cause was neither more nor less than a love for liquor; and every body sees it but yourself.

"Again, it is suspected that you have not always been quite so honest as you should have been; that your bargains have not always been fair and open; that you have sometimes endeavoured to over-reach a neighbour secretly, where you knew the law could not touch you; that you have taken the advantage of the ignorance of a purchaser, to charge more than you knew your commodity was worth; that you have praised the commodity you sold for qualities which you well knew it did not possess.—Now, though you know all this to be true, you will probably lessen it in your own eyes by a thousand little shuffling excuses. Let the purchaser (you may suggest to yourself) mind his business; I mind mine: I do not impose upon him, he imposes on himself: he should examine what he buys; I am not to teach him his business: am I to be both buyer and seller?—there is an art in every thing—there is an art of buying, and an art of selling; and a man must live by his art.—By such self-deceit you can easily impose on yourself; but how are your evasions overturned by one plain question, which an honest conscience would suggest! Suppose a person should treat you in this way. Suppose he should sell you an unsound beast for a sound one, or a piece of damaged goods for what ought to have been perfect, and allege all the excuses which you have just alleged, would you be imposed upon by them? Would you, in short, call him an honest man; or would not you be more inclined, as I verily suppose you would, to think him, with all his fine excuses, an arrant knave?"

"You see then, my brethren, how self-love imposes on us, and makes the same thing, or nearly the same thing, appear trifling in ourselves, which appeared so offensive in our neighbour. You see how difficult it is for any one to say to himself, *Thou art the man*; though each of us is ready enough to condemn an offending brother."

Nine sermons on St. Matthew's gospel are published in this volume, "as a specimen of a mode of preaching which Mr. Gilpin thought might be useful to a

country congregation." These deserve attention; but they will be found not sufficiently extended. Too large a portion of scripture forms the subject of each discourse. The utility of such a plan cannot be disputed. As Mr. Gilpin rightly observes, "The scriptures will be read with more pleasure, the more each little difficulty which now and then stops an unlearned reader is removed."

The twenty-fifth and concluding sermon, following immediately those on St. Matthew's gospel, is designed to shew that the words of eternal life are the only safe guides we can follow in the investigation of truth, and in the government of our conduct.

This volume contains twenty-three sketches, as hints for sermons. The

younger clergy, especially such as are settled in country villages, cannot do better either for themselves or their flock, than occasionally to fill up these outlines, faithfully copying the style and colouring of these finished pictures of this master.

The volume concludes with two excellent tracts; one an *analysis of Paul's epistle to the Romans*; the other entitled *Illustrations used by St. Paul in his writings*. In the controversy, which is now agitated within the pale of the established church, the first of these tracts may be found useful. We recommend it to the serious consideration of those who are zealously contending for the calvinistic doctrine, which they assert is to be found in the seventeenth article of faith.

ART. XXI.—*Sermons for the Use of Colleges, Schools, and Families.* By JOHN NAPLETON, D. D. Chancellor of the Diocese, and Canon Residentiary of the Cathedral Church of Hereford. 8vo. pp. 382.

THIS second volume will ably support the credit which the first conferred upon the author, as a sound and useful preacher. The sermons now published display a correct taste and an enlightened judgment: the discussion of mysterious and metaphysical doctrines gives place, as it ought, to practical theology; the style is plain without meanness, level with the attainments and the capacities of a rustic audience, and at the same time not unsuited to the chapel of a college. Nor are the subjects upon which the preacher dwells unimportant, as will be seen by the following sketch of the contents of this volume: On setting God before us. On not caring for religion. On faith. On profession of faith. On the miracles of Christ. On prophecy. On the uses of the law. The great exemplar. On the sabbath. On religious knowledge and practice. On exemplary conduct. On temporal happiness. On sickness. On the resurrection of Christ. The divine nature hidden. On christian mourning. Approach towards perfection. On consolation. These subjects are well discussed in twenty sermons.

The following extract, very important in itself, will convey to our readers a just notion of the style and manner of our preacher. It is selected from the discourse on miracles. Having shewn in the first place that the miracles of Jesus were such as could not possibly be effected by human art or industry, he thus proceeds:

"Secondly. The miracles of Jesus were

of such a nature, and so circumstanced, that it was impossible for a witness of common sense to imagine they were effected if they were not; or to doubt whether they were effected or no. They were no spectre, or apparition, presented for a moment to the eye; no sounds, or voices, offered for an instant to the ear; passing away before the respective organs could seize their object, and distinctly examine it; or before the report of one sense could be tried by that of another; before reason could decide upon the compound report of both. They were no objects exhibited to the doubting senses, at undue distances, or through deceiving mediums: no burning comets, or portentous appearances in the sky, or in the air. These miracles were laid before the witnesses in as clear a manner, and for as long a time, as the ordinary works of nature, or the common performances and transactions of mankind. They fell under those senses which are least capable of being deceived: they were seen, they were heard, they were handled; they had all the evidences which the faculties of man can give him of the existence of any thing in this material world. If I see "the man sick of a palsy arise, take up his bed, and go into his house," I have the same assurance of his cure, as I had before of his infirmity. If the fever, or the leprosy, depart at the touch of Jesus, the health and soundness of the patient is as manifest, as if it had proceeded from the slow operation of medicine, or the gradually returning healthy state of nature. The sisters of Lazarus, and the Jews of Bethany, had not better proof that Lazarus was born, and had lived among them before his death, and that he was dead and buried, than that he returned to them from his grave, and lived with them afterwards. The facts were evident in their nature; complete in the execution; lasting in their effect. Lazarus remained with his fa-

only an object of admiration to the people, and of terror to the chief priests. Mary Magdalene, rescued from the dominion of evil spirits, lived to be a sober witness of her saviour's resurrection. It is said also, that many others, who had in like manner experienced his power and goodness, lived in the days of the apostles to extreme old age.

"Thirdly. The miracles of Jesus were performed in a civilized nation; in an enlightened age; at public festivals, and in other large assemblies; before witnesses of various stations, characters, and countries. The Jews, among whom our Saviour was born, and before whom he exhibited his mighty works, had long since, from the special advantages which they enjoyed, (though not always from the use which they made of them,) deserved the distinction of "a wise and understanding people." They were in possession of an authentic history of the world, beginning at the creation, carried through the first ages, and tracing the origin of the earliest nations. They had a system of true religion and sound morality, unknown in the schools of Athens, or in the palaces of Rome. They had poetry not surpassed in any age or country. All these confessedly were written by their ancestors, read in their synagogues, taught in their schools, revered in their families. The splendour of their temple, the curious manufacture of its furniture, their application of musical instruments and voices in surprising numbers, to high strains of eloquence upon the noblest subjects,—all these, existing a thousand years before the coming of Christ, shew their rank among the nations of those primitive times in the arts and embellishments of life. So that if any writer, ancient or modern, has thought proper to speak of them as an obscure, ignorant, or barbarous people, he seems to have been misled by national or sceptical prejudice; or to have been influenced by a partial view of their present humiliated state: forgetting how few, if any, of the European nations, among whom the providence of God hath scattered them, can shew any evidence of cultivation, or even of existence, at the time when "Moses was learned in all the wisdom of the Egypt-

tians," and instructed moreover by revelations from heaven. This people had, before the birth of our Saviour, in consequence of their captivities and other circumstances, intermixed with various other civilized nations. Conquest and proselytism had brought to them divers foreigners to administer their government, and to worship at their altars. They had strangers from Rome, visitors from Africa, and from distant parts of Asia. It was probably from this intercourse with foreign nations, that they were become degenerate in their religious principles. As the conversation of their idolatrous neighbours had formerly seduced them into gross and horrid superstitions; so now they had imported from distant countries the more refined, but not less dangerous, poison of infidelity. The creed of the early ages was now questioned among them by a presumptuous philosophy. What holy Job believed, and what Abraham knew by familiar experience, was rejected by the pretended wisdom of these enlightened times: for there were some among the disciples of Moses, and even in the sanhedrim, who "said there was no resurrection; neither angel, nor human spirit." But this unhappy prejudice, into which a part of the nation (the Sadducees) had fallen, confirms the incontestible reality of the miracles of Jesus; as it rendered them more averse from his person and doctrine; more unbelieving of his divine character, more quick-sighted in the examination of his wondrous works; more determined, had it been possible, to disallow them, and defeat their credit. As his religious doctrine clashed with the notions of the Sadducee, so did the lowliness of his worldly situation and pretensions disappoint the expectations, and excite the aversion, of the Pharisee: who, though he believed a resurrection and a life to come, yet could not resign the temporal dominion and prosperity, which he had promised to himself from "the redeemer of Israel." It appears then plainly, what was the scene of our Saviour's miracles, and who were the spectators. "These things were not done in a corner," nor before incompetent or favourable judges."

ART. XXII.—*Sermons on various interesting Subjects. By the Reverend JOSHUA MORTON, Vicar of Risby in the County of Bedford, and Chaplain in ordinary to his Royal Highness the Prince of Wales. Vol. II. 8vo. pp. 385.*

TO those who have approved of the former volume, this also will be acceptable; and that many have approved of it, may be reasonably concluded from the appearance of that now before us. Orthodox, confident, versed in a kind of phraseology highly pleasing to the multitude of christian believers, Mr. Morton, we have no doubt, is a popular preacher, and will easily find readers and admirers. His bookseller we apprehend will never say of his discourses, as we are informed one of the trade said of a volume already noticed, that they are too good for sale.

Thirty sermons are contained in this volume, upon the following subjects: Divine worship. The gospel the word of life. The fall of man. The fall general. All men under the sentence of the law. The redemption of man by Christ. The ministry of reconciliation. Death. The uncertainty of life. God chastiseth us for our good. Prayer. Perseverance in prayer. The strong hold. The work of salvation. The true rest of the gospel. The blessings resulting from the ascension of Christ. Belshazzar's feast. The penitent's prayer. The prodigal son. Hope.

in God, the good man's support. The patience of God with mankind. God merciful to the eleventh hour. Fast day sermon, 1803. The excellence of the scriptures. The furnace of affliction. The blessedness of faith. The interesting character of Jesus. The one thing needful. The death of Christ and his resurrection. The close of Paul's ministry, and his hope asserted. We subjoin the following extract as a specimen of our author's manner :

"Would you have your plan of action decided in the whole of your intercourse with the world, set his example always before you, listen to his instructions who spake as never man spoke. Had he been asked to give you his own portraiture, were you to put the question again, "Sir, we would see Jesus," you will see him in his own parable of the good Samaritan. Whilst the priest and Levite pass far from the scenes of misery, benevolence draws near in the person of a good Samaritan, to the robbed, wounded, dying traveller; and, with all the tenderness of compassion, applies the healing balsam to his wound, and prompt relief to his necessities. In this scene we see national partiality subsiding, religious prejudices banished, no voice heard but that of goodness. Nay, we see something more; we see Jesus Christ as possessing that promptitude and that power to save the children of men, which ought to raise him high in our estimation, and place him supreme in our affections. He came when man was in this vale of guilt and of misery, and when he saw him he had com-

passion on him, and went to him and bound up his wounds, pouring in oil and wine. In the obedience of his life was formed a perfect righteousness, satisfactory to all the claims of divine justice, infinitely sufficient to justify all who believe on him from all things from which they could never be justified by the law of Moses. Would you see Jesus in the very moment of his perfecting our redemption? Behold him in the garden of Gethsemane prostrate upon the earth, and in an agony there, till the sweat falls as great drops of blood to the ground. Trace him to the courts of the Jewish and Roman judicature; in the one you see him blasphemed and beaten, in the other, scourged and crowned with thorns; follow him a little further, and you see Jesus suspended on the bloody tree; his nerves trembling with the torturing nails, his body writhing with dreadful agony. Would you see Jesus? look up to the cross guilty, but penitent; look up, and see his brow beaming benignity and love; behold the blood gushing from his opened side; there springs the fountain of your hope; there flows the blood of Jesus Christ, the Son of God, which cleanseth from all sin. May each of our hearts catch the healing stream, and be saved with an everlasting salvation. Once more, we see him rising from the bed of death, triumphing over the grave, (for it was impossible that the grave should hold him), ascending to heaven, there, exalted beyond all praise and all thanksgiving, he ever lives to make intercession for us, having our interests still near his heart, possessing the same love, pity, and tenderness, he is ready to communicate daily to all who seek his assistance, every grace and every blessing to help them in time of need."

ART. XXIII.—*Occasional Discourses on various Subjects, with copious Annotations, by* RICHARD MUNKHOUSE, D. D. of Queen's College, Oxford, and Minister of St. John Baptist's Church, Wakefield. In Three Volumes. 8vo. pp. 343, 379, and 402.

DR. Munkhouse does not now appear before the public for the first time. Of the twenty-five discourses of which these volumes are composed, several have been already submitted to the judgment of the public, and with that judgment the author is fully satisfied. He exults in the flattering reception which they experienced, and feels himself relieved from a part of his apprehensions concerning the estimation in which the present volumes will be held. The style of these discourses is not destitute of a certain degree of energy; and the principles which prevail throughout discover a firm and zealous attachment to the civil and ecclesiastical establishments of our country. Concerning the subjects of these discourses, and his own sentiments and principles, the author thus speaks :

"The subjects that most frequently occur in the ensuing discourses, are such as naturally arose out of those occasional fasts and festivals, which have, in the course of the last twelve

years, been appointed to be solemnized by royal proclamation. These, it is hoped, breathe a spirit of piety and devotion, suited at all times to the nature of the service, whether of penitence and supplication, or of praise and thanksgiving. Questions also of a political nature are brought under discussion; not from any design, in the breast of the author, to infuse politics into religion, but, on the same principle by which so close a connexion exists between church and state, to infuse religion into politics; and from an anxious wish to promote, to the extent of his ability, the interests of his country, and the cause of social order, by strenuously inculcating the virtues of patriotism and loyalty, in opposition to those plausible, but imposing and deceptive, doctrines of liberty and equality, which have of late years been advanced with such shameless effrontery, and circulated with a malevolent assiduity.

"Inseparably connected with the prosperity of our country is the preservation of its political constitution, the permanence of its establishments, civil and ecclesiastical. Hence the author's dislike of republican tenets, be-

care of their hostility to the former; and of sectarian, as being more immediately injurious to the latter: without a wish, notwithstanding, to restrain the liberty of choice, and freedom of discussion, farther than as such restriction may be necessary to the peace of the church, and to the safety of this UNITED KINGDOM. There are, doubtless, virtuous characters under every form of civil government; and he ventures to reckon, in the number of his friends, many upright, conscientious, good men, whose religious tenets are very different from his own."

In these volumes we are presented with *nine fast sermons*; three sermons on occasion of public thanksgiving; four preached before different lodges of freemasons; one before a friendly society; one on the first Sunday in the year; one on the slave trade; one on the opening of

St. John's church; one previous to the introduction of Merrick's psalms; one for the benefit of the green-coat charity school; one for the benefit of the choir in St. John's church; one preached upon the delivering the colours to the royal Wakefield volunteers; and one at Hona-gate whilst they were upon permanent duty.

Each discourse is either "inscribed with the name of a friend or benefactor, or dedicated to some exalted personage: and thus the author professes to have alike indulged the fondness of affection and the feelings of gratitude, and paid a willing tribute of respect and admiration to resplendent virtue in high places." Pref, p. xiv. The public prints have lately announced that Dr. Munkhouse has been preferred to the vicarage of Wakefield.

ART. XXIV.—*Sermons, altered and adapted to an English Pulpit, from French Writers.* By SAMUEL PARTRIDGE, M. A. F. S. A. Vicar of Boston, and of Wigtoft with Quadring, Chaplain to the Right Honourable Lord Gwydir, and late Fellow of Magdalen College, Oxford. The Second Edition. 8vo. pp. 327.

FEW of the French sermon-writers deserve translation. Bossuet and Saurin have more of thought, argument, and of that sort of eloquent decoration which depends not on the language but the idea, than their competitors. Flechier is overrated in his country. Massillon has a brilliant oration on the consecration of colours. Bourdaloue is ingenious and stately, but wants originality and feeling. We have here selections, not from the renowned but from the secondary French preachers; from the Cambaceres, the Duboses, the Lecointes, and the Donespes.

For a patriot, it is consolatory to observe how inferior to the Jeremy Taylors, the Halls, the Barrows, are these continental orators; how much less of learning, of style, of argument, has satisfied, has delighted, has convinced their hearers, has hushed their doubts, has warmed their zeal, has winged their hopes. Well might infidelity triumph where it had

only to assail such ordinary intrenchments. Well might floundering piety despair, where it had only such wisps of straw to catch at. Better surely had it been to translate those sermons of our cotemporary Mercier, which have illustrated a London pulpit and a London press.

We really cannot find a tolerable extract. So much the better. These sermons are probably not intended to be read, but to be preached. They are the fitter for the pulpit, from being likely to escape domestic circulation among the audience. Delivered by every-day men, they may well pass for original. Listened to by every-day men, they may be staid out without fatigue; for they have been abridged within limits which will accommodate a three-church curate. In the doctrine there is nothing for orthodox to wince, or heresy to kick at: it is every-day christianity without a specific character, little enough to live with, much enough to die with.

ART. XXV.—*Twelve Sermons on important Subjects. Addressed chiefly to the middle and lower classes of Society.* 8vo. pp. 352.

THE subjects are; the omnipresence of the Deity. The cross of Christ. The christian's glory. Christianity consistent with reason. Christianity not seditious. The wisdom and power of God displayed in the redemption of the world. The universal judgment. On hearing the word of God. The love of God. The deceitfulness of the heart. The equality of mankind. The divinity of Jesus Christ. And, spiritual worship.

"These sermons," the preacher informs us, "have been delivered at different times and to different congregations. They have been heard with deep attention, and often with considerable emotion." We do not doubt it. All that is excellent is borrowed from our most celebrated pulpit orators, with no more than a general acknowledgment; and all the original matter is of a showy tinsel nature, admirably adapted, if well delivered, to

make an impression upon the minds of the ordinary class of hearers. But we must enter our protest against such flagrant peculations as this anonymous divine confesses. As large portions of works already before the public are thus again to be carried through the press, they should

be particularly marked, that there may be no danger of their being attributed by those who have not known them in their original form, to the plagiarist in whose pages they are confounded with his own matter. *Cuique suum.*

ART. XXVI.—*Sermons on the Existence of the Deity, the immortality of the Soul, the Authenticity of the Bible, and other important subjects.* By the Reverend J. ADAMS, A.M., Master of the Academy at Putney, and Author of several much-approved historical Publications. 8vo. pp. 314.

IT is not very usual, perhaps, for an author to review his own productions; but as Mr. Adams is by his own confession little else than a compiler, we will allow him to be his own reviewer. Hear then :

"The following sermons will be very useful as a family book, particularly where there are young people; for the sooner they begin to have a veneration for the Deity and the christian religion, they are the more likely to be good members of society. They will be more dutiful children, better servants, better masters, and better soldiers too. "I fear God, and I have no other fear," is the celebrated saying of a great man, who was dissuaded by his friends from a dangerous undertaking in a good cause.

"It may very naturally be remarked, "that nothing new can be said on such subjects." True. But as the classical and historical publications of the author have fallen into the hands of, at least, one hundred and thirty thousand persons, many will be induced to read the sermons, because they were pleased with his other literary productions.

"The excellent writers consulted for materials, are Stillington, Abernethy, Addison, Butler, Bryant, Clarke, King, Pearson, Tillotson, Scott, Sharp, Baxter, Swift, Sherlock,

Porteus, Paley, Seed, Langhorne, Sterne, Mason, Grant, Burnet, Barrow, Sherlock, West, Ray, Derham, Atterbury, Blair, and Leland.

"It may not be improper to add, that there is not, in the whole volume, a single sentiment contrary to the doctrines of either church established in Great Britain."

The materials which the industrious compiler has collected, are arranged under the following heads: On the existence of the Deity. On the study of the works of God. On the immortality of the soul. On providence. On the omnipresence and omniscience of the Deity. On the divine origin of the scriptures. On religious hope. On the pleasures of religion. On the internal excellency of the christian religion. On the government of the thoughts. On religious retirement. On true wisdom. On consideration. On the character of Jesus as a divine teacher. On christian benevolence. On the advantages of prayer, and pious contemplation. On the resurrection. On the joys of heaven. On the certainty of future happiness. On the love of God. On human life, duelling, and suicide.

ART. XXVII.—*Three Sermons, preached at the Wednesday Evening Lecture at Salters'-Hall, London; to which is added, the Substance of a Discourse delivered at Maze Pond, Southwark, in aid of the particular Baptist Fund.* By JAMES DORE. 8vo. pp. 135.

THESE Sermons are upon the following subjects: On Modesty in prosecuting Religious Enquiries. On the proper Use of the Figurative Language of the Scriptures. On the Spiritual Nature of the Gospel, and on the Harmony of the Divine Operations. They are not destitute of merit, though not distinguished by any

peculiar excellence. The preacher adopts not only the doctrine but the style of the old school; the divisions and subdivisions are tediously minute, and the studied brevity of almost every sentence produces a monotony which no powers of delivery we apprehend could relieve.

ART. XXVIII.—*Two Discourses, designed to recommend a general Observance of the Lord's Supper.* By T. DRUMMOND. 8vo. pp. 43.

THESE Discourses are well composed and adapted to answer the preacher's design. The origin of the simple and social service, which is here recommended to general observance, is clearly and justly stated, and, the corruptions which it has

undergone are briefly but satisfactorily detailed. The information which these discourses convey will be acceptable to those who may not approve of all the principles of the author's creed.

SINGLE SERMONS.

ART. XXIX.—*Justification by Faith. A Sermon preached at the Primary Visitation of the Right Rev. Father in God, HENRY WILLIAM, Lord Bishop of Chester, held at Richmond in Yorkshire, August 22, 1804, and published at his Lordship's request. By JOHN HEADLAN, A. M. Rector of Wycliffe. 4to. pp. 30.*

THE preacher has selected for the subject of his discourse the enquiry by Job, "How shall man be just with God?" and from these words has taken occasion to combat, with some ability, that large and daily increasing schism in the church, which calls itself the *True Church of England*. Mr. H. begins by stating the orthodox doctrine of the fallen nature of man, and the remedy which has been provided. He expresses his astonishment that, at the present period, any questions are agitated concerning the justification of the sons of Adam by faith, and proceeds to consider what the doctrine of the church is upon this subject; and also the nature and effects of some prevalent errors arising from a different interpretation. After a very particular examination of the nature and consequence of faith, the preacher observes:

"This seems then to be the sum of the doctrines of our church, founded upon the authority of scripture, on this important subject; that we are justified by faith alone; that faith means a simple but sincere belief in the gospel of Christ; that justification means the change which is effected in us on our becom-

ing christians, and the difference thence produced between our fallen and our redeemed nature; that baptism is the only rite ordained by Christ himself, as the means whereby we receive this gracious privilege; that when we are thus justified in baptism, good works are absolutely necessary to make our calling and election sure; that although by faith alone we are justified, we must nevertheless bring forth fruits meet for salvation, and can obtain eternal happiness only by perseverance in faith, in hope, and holiness."

In a few short observations on the nature and effects of the prevalent errors, Mr. H. charges those who arrogate to themselves the title of true churchmen, with affixing an erroneous meaning to the word justification, confounding acceptance here with final acceptance at the day of judgment; by this means producing an unscriptural and baneful separation amongst christians, and at the same time by their denial of the spiritual grace of baptism, opening a door to enthusiasm and delusion. This discourse is well written, and clearly convicts the *True Churchmen* of error; but has Mr. H. himself, supported as he is by Hooker, Waterland, Jones, and Paley, discovered the truth?

ART. XXX.—*A Sermon, preached before the University of Oxford, at St. Mary's, on Monday, Nov. 5, 1804. By the Rev. HENRY PHILLIPOTTS, M. A. of St. Mary Magdalene College, and Vicar of Kilmersdon, in the County of Somerset. 4to. pp. 18.*

THE author of this temperate and well written discourse has, of the two events by which, in the annals of our country, the fifth of November is distinguished, chosen for his subject the establishment of king William III. on the English throne. He first takes a retrospective view of the principal circumstances in our history that rendered some such great crisis unavoidable, and shews how favourable, above all others, the period in which it did happen was to the preservation, both of the peace of the country and the integrity of its con-

stitution. He then offers some remarks on the real character of the event itself, affirming, that it was not a revolution but a measure devised, and happily accomplished, to prevent a revolution of the very worst kind; an awful crisis, in its consequences but not in itself, the subject of rejoicing; and he concludes with pointing out some instruction resulting from that view of the subject which he has taken. The whole is well adapted to promote that political moderation which tends to the peace and improvement of the state.

ART. XXXI.—*The Faith and Hope of the Righteous; a Sermon preached at the Octagon Chapel, Bath, on Sunday, Dec. 2, 1804, on Occasion of the Death of the Rev. ARCHIBALD MACLAINE, D. D. By the Rev. JOHN GARDINER, D. D. 8vo. pp. 39.*

AFTER contrasting the righteous and the wicked, struggling with adversity and

at the close of life, Dr. G. passes to the eulogy of the pious and learned subject of

this funeral discourse. This might, we think, have been done with more judgment, with more feeling, with much greater effect, and in a manner better suited to the character of the truly venerable person, on occasion of whose death it was composed.

ART. XXXII.—*Enoch, or the Advantages of high Attainments in Religion. A Sermon, preached at Orange-street Chapel, Leicester-square, London. By WILLIAM MOSELEY, Minister of the Tabernacle, Hcmly.* 12mo. pp. 33.

THE author of this discourse sends it into the world with a desire of promoting personal religion. The end is important, and the means here employed likely, to a certain degree, to accomplish that end. Many pious observations occur, expressed in a forcible and impressive manner, but such an indiscriminating use of scripture we have seldom witnessed. The title-page proclaims the class of christians to which the preacher belongs, and in which this discourse will be found most acceptable.

ART. XXXIII.—*A Sermon, preached before the Honourable House of Commons, at the Church of St. Margaret, Westminster, on Wednesday, Feb. 20, 1805, being the Day appointed for a General Fast. By CHARLES HENRY HALL, D.D. Canon of Christ Church, Oxford.* 4to. pp. 23.

FROM the words of the apostle Paul in his epistle to the Romans, ch. viii. v. 31. "If God be for us who can be against us?" the preacher takes occasion to enumerate many of the most visible and striking instances of God's favour to us as a nation. He next proceeds to notice some spots and blemishes in our national character. It ought not perhaps, all circumstances considered, to excite our surprise, though it may our indignation, that in this part of the discourse the preacher has omitted the mention of that abominable traffic which is still carried on upon the blood-stained shores of Africa. This sermon is, upon the whole, well written; but neither in style nor sentiment differs much from the generality of sermons on similar occasions.

ART. XXXIV.—*A Fast Sermon, preached at the Abbey Church, Bath, on Wednesday, Feb. 20, 1805. Published at the Request of the Mayor and Corporation of Bath, and the Colonel and other Officers of the Loyal Bath Volunteers. By the Rev. EDMUND POULTER, M. A. Prebendary of Winchester.* 8vo. pp. 33.

WITH much labour we got through this uninteresting ill-written discourse; and, if any of our readers are fond of exercising their ingenuity in unraveling long and intricate periods, they may here find ample amusement.

ART. XXXV. *The fatal Use of the Sword; considered in a Sermon preached in St. Philip's Church, Birmingham, on Wednesday, Feb. 20, 1805, the Day appointed for a General Fast. By the Rev. SPENCER MADAN, A. M.* 8vo. pp. 26.

THE text chosen by Mr. M. is Matt. xxvi. 52. "Then said Jesus unto him, Put up again thy sword into his place, for all they that take the sword shall perish with the sword;" and the object he has in view is to confute the principles which Mr. Warner advanced from the same words, and of which an ample account was given in our last volume. These principles are here successfully combated, but Mr. Madan is perfectly right, when he observes in a postscript, that they "have been noticed by more competent examiners."

ART. XXXVI.—*The Holy Spirit, the Spirit of Truth; a Sermon preached at the Baptist Monthly Association, at Mr. BURNSIDE's place of Worship, Red Cross-street, Cripplegate, Feb. 21, 1805. By JAMES DORE. Published at the Request of the Associated Ministers and Brethren.* 8vo. pp. 42.

THE Holy Spirit, says the preacher, is the spirit of truth, because he revealed the truth, he authenticated the truth, and he accompanies the truth with his divine influence. Upon these three topics Mr. Dore has enlarged in such a manner as we can easily conceive was acceptable to the congregation assembled as his auditors.

ART. XXXVII.—*The Progress of Error concerning the Person of Christ; represented in a Sermon, delivered at the Unitarian Chapel in Essex-street, March 31, 1805. By THOMAS BELSHAM. 8vo. pp. 35.*

THE first part of this discourse contains a very well written epitome of the history of opinions concerning Christ, as it has been described more at large by Dr. Priestley. This is followed by some reflections arising out of the preceding view of what the preacher deems the progress of error respecting the person of

the Messiah. A prayer appropriated to the discourse and to the occasion on which it was preached, is subjoined. The preacher's hope 'that a double portion of the prophet's* spirit might rest where his mantle falls,' appears from this discourse, likely to be realized.

ART. XXXVIII.—*Baptismal Faith explained. A Sermon, preached before the University of Cambridge, April 8, 1804. 4to. pp. 20.*

THE doctrine of this discourse would, we apprehend, be better suited to the chapel in Essex-street than to the church of the university of Cambridge.

"It hath been observed, says the preacher, in favour of the christian religion, that its positive institutions are not only few in number, but also in their whole nature perfectly simple and intelligible. The observation is certainly just in itself; but how few christians can consistently urge it against the adversaries of our faith, if they are themselves sincere in the representation of these institutions which they publicly avow? Can the Roman-catholic, who believes transubstantiation to be directly taught in one of them? or the protestant, who contends that a belief of the doctrine of the Trinity is expressly required by the other?"

"I mean not to insinuate any comparison between these doctrines, or to affirm the truth or falsehood of either. I only mean to affirm, that whoever undertakes to prove the excellency of the christian revelation from the plainness and simplicity of its external rites, must be able to shew clearly that the doctrine of the Trinity, as stated in the creeds and articles of religion owned by the generality of protestants, hath no better foundation in the form of words used by our Saviour in the institution of one of them, than that of transubstantiation hath in the form of words, used by him in the institution of the other. This I shall attempt to do in the following discourse, not merely for the sake of doing justice to the argument advanced in favour of our religion,

from the perfect simplicity of its positive ordinances, but for the higher purpose of ascertaining that faith which is made necessary by Christ and his apostles, to entitle a person to the name and privileges of a christian. That some faith is necessary cannot be denied; but what that particular faith is, hath long been matter of great dispute among christians themselves."

Of this faith Mr. T. thus sums up his account:

"Let us not then be ashamed of the pure gospel of Christ. The belief of it consists not in believing any other doctrine but that of eternal life, by the remission of sins and a resurrection from the dead, through the man Jesus Christ, the righteous Saviour and destined Lord of mankind. Neither our christian privileges nor christian duties, depend on any other faith. What higher privilege can we enjoy, than that of being children of God? which is secured to us by our faith in Jesus Christ: by that faith, whether we have been Jews or Gentiles, we are all the children of God. What higher duty is enjoined us than that of conquering the world? What nobler victory can be gained by any faith? 'And who,' says the apostle, 'is he that overcometh the world, but he that believeth that Jesus is the son of God?'"

How general must have been the exclamation as the astonished gownsmen returned to their homes,—'We have heard strange things to-day!'

ART. XXXIX.—*The Use and Abuse of Reason in Matters of Faith. A Sermon, preached at St. Chad's, in Shrewsbury, at the Triennial Institution of the Hon. and Right Rev. James Lord Bishop of Lichfield and Coventry, May 28, 1805. By SAMUEL BUTLER, M. A. Head Master of Shrewsbury School, and late Fellow of St. John's College, Cambridge. 12mo. pp. 22.*

MATTERS of faith, says Mr. B. may be considered as of three kinds. They are either matters of historic fact and reason only, as that there was such a person as Jesus Christ, the history of whose life

was written by his disciples, and is preserved to us; or they are matters of *fact and revelation only*, as that Jesus Christ was the son of God from all eternity; or they are matters of *consequence*, deduc-

* The Rev. T. Lindsey, the founder of the chapel in Essex-street.

cible from both the former. With the first of these learning is altogether; with the second, in no degree; and with the third, partially concerned. Upon these principles the preacher censures all disputation upon the doctrines of election and reprobation, and the Trinity. But he has neglected the very important circum-

stance, that these doctrines are discussed and by some rejected, not because they are above human reason, but because they are not to be found in the word of God. By those therefore, for whose benefit we suppose the discourse before us was intended, the preacher's reasoning will be considered as altogether irrelevant.

ART. XL.—*The Unity of the Christian Body stated. A Sermon preached in Lambeth Chapel, on the 28th of April 1805, at the Consecration of the Right Rev. Henry Bathurst, LL. D. Lord Bishop of Norwich, and published at the Command of His Grace the Lord Archbishop of Canterbury. By RICHARD PROSSER, D. D. Prebendary of Durham. 4to. pp. 19.*

A temperate but not a very forcible defence of religious establishments; from Eph. iv. 15, 16.

ART. XLI.—*A Funeral Oration, to the Memory of His Royal Highness the late Duke of Gloucester and Edinburgh, delivered at Grosvenor Chapel, Grosvenor Square, on Sunday the 8th of September, 1805. By the Rev. T. BASELEY, A. M. Chaplain to the Right Rev. the Lord Bishop of Lincoln. 4to. pp. 23.*

COMMON place declamation, and one uniform tissue of 'pompous nothings.'

ART. XLII.—*The Origin of Sovereign Power, and the Lawfulness of Defensive War. A Sermon preached in the Church of All Saints, Wainfleet, in the County of Lincoln, on Tuesday, June 4th 1805, to the Wainfleet Corps of Volunteer Infantry. By the Rev. PETER BULMER, A. B. 8vo. pp. 29.*

WE have had occasion formerly to commend Mr. Bulmer as an animated and a patriotic preacher, and that commendation is further warranted by this discourse.

We cannot speak of him with equal praise as a politician.

PRACTICAL THEOLOGY.

ART. XLIII.—*A Guide to Heaven: seriously addressed to all who believe the Gospel to be the Word of God. By the Rev. C. S. HAWTREY, A. B. Vicar of Widston, Monmouthshire. 8vo. pp. 172.*

THIS little work has been composed evidently with the best intentions, but, we fear, not altogether in such a manner as to secure the accomplishment of the author's pious wishes. Feeling, as he informs us, an earnest desire, seconded by the imperious call of duty, as a minister of the gospel, to impress his fellow-creatures with a sense of the great importance of a practical obedience to all its laws; and convinced that, after what has been so ably but so ineffectually written upon the subject, no arguments which he could use, no exhortations which he could utter, would be likely to avail—he determined to collect the numerous and urgent precepts of practical piety which the gospel contains, and arrange them under proper heads. In this little volume therefore, we have exhibited at one view the greatest part of what the scripture directly teaches, concerning forgiveness and mutual love;

the duty of prayer, covetousness, and worldly-mindedness; temperance and chastity, humility, justice, honesty, and truth; swearing and blasphemy; repentance; the Lord's supper; charity to the poor; fortitude in adversity; conjugal love; parental and filial love; masters and servants; obedience to governors, and conduct of the clergy.

Every collection is followed by what is called an application; but this is in several instances so short, and so deficient in energy, as to produce no effects. We are convinced that a selection of this kind might be made eminently useful, but it should be formed by a person of judgment, of taste, and, at the same time, mighty in the scriptures. The precepts should be arranged as much as possible in some connected order, and closed or followed by something more than unmeaning exclamations.

ART. XLIV.—*The Holy Family; being a complete Provision of Domestic Piety. In which are Reflections on Education, Prayer in its Public and Private Duties, and an Exhortation*

tation to the Sacrament as Essential to Salvation; to which are add d Morning and Evening Prayers for Families, &c. &c. By the Rev. T. OAKLEY, A. M. 8vo. pp. 116.

THE title of this strange work will give our readers some notion of its contents, it is for us to shew them the value of this volume: we cannot do this better than by citing the author to speak for himself:

"Christ, in the first view of his heavenly powers, is the risen sun of a new world, a luminary, unconfined by nature, and expands through the infinity of space: I am come 'light into the world,' in whom the morning dawns of the everlasting day.—P. 91.

"Christ is our propitiation, and his mercies tendered in the latest hour; but the hope of

glory is the fair penitent's, and to the impenitent no remission of sins. P. 94.

"Heaven is the marriage of salvation, and its many mansions a court where guests throng from every clime; and angels hail the nuptials of Christ, and his spouse the church; his joys are the fathings that are killed; his dinner, everlasting life.—P. 98.

"O! hallowed blood of Christ, infuse thy vital powers into my soul, and through every vein of my body!"—P. 113.

This, and much more like it, issues from the university press of Oxford!!

ART. XLV.—*A Brief Treatise on Death, Philosophically, Morally, and Practically considered. By ROBERT FELLOWES, A. M. Oxon. 12mo. pp. 134.*

THIS treatise is inscribed to the memory of the lady Harriet Fitzroy—by the death of whom, we conjecture, this valuable little work was suggested. The sentiments it contains are such as on different occasions, and by different writers, have been before inculcated; but they are placed by Mr. F. in an interesting and impressive point of view, well adapted,

according to his purpose, to reclaim the thoughtless—to alarm the wicked—to increase the hope of the righteous—to cheer the dying—and to comfort the afflicted mourner. To those who belong to any of these classes of persons, we earnestly recommend this pious and instructive performance.

ECCLESIASTICAL AFFAIRS.

ART. XLVI.—*The Expository Works, with other Remains (some of which were never before printed) of Robert Leighton, D. D. Archbishop of Glasgow: with a Preface. By PHILIP DODDRIDGE, D. D. A New Edition, to which is now Prefixed the Life of the Author. By the Rev. ERASMUS MIDDLETON. In Three Volumes. 8vo. pp. 323, 484, 488.*

ARCHBISHOP LEIGHTON was a man of considerable note in his day, and his works have always been regarded as valuable, on account of the spirit of piety that pervades them. The present collection, which professes to be complete, contains his practical commentary on the first epistle of Peter; expository lectures on Ps. xxxix.; Is. vi.; and Rom. xii.; several charges, &c. to the clergy of the diocese of Dunblane; seven letters on different occasions; rules and instructions for a holy life; some historical facts in his life,

never before printed; twenty-eight sermons; exposition of the creed, the Lord's prayer, and ten commandments; discourses on Matt. xxii. 37, 39.; on Heb. viii. 10.; and a short catechism. The preface by Dr. Doddridge was originally prefixed to an edition of the archbishop's works, published at Edinburgh in 1748; by Mr. D. Wilson. The life which accompanies the present edition, written by Mr. E. Middleton, is one of the worst articles of biography we ever perused.

ART. XLVII.—*An Essay on the Spirit and Influence of the Reformation of Luther; the Work which Obtained the Prize on the Question Proposed in 1802, by the National Institute of France; 'What has been the Influence of the Reformation of Luther on the Political situation of the different States of Europe, and on the Progress of Knowledge?' With a Sketch of the History of the Church, from its Founder to the Reformation; intended as an Appendix to the Work. By CHARLES VILLERS. Translated, and Illustrated with Copious Notes. By James Mill, Esq.*

ART. XLVIII.—*Essay on the Spirit and Influence of the Reformation by Luther, &c. faithfully Translated from the last Paris Edition. By B. LAMBERT.*

ACADEMIES may propose wise questions, but they are not likely to receive

wise answers. They send abroad a question which requires long study and long

thought, and fix a day for the reply, later than which none can be received. It is very well for booksellers to do this, whose journeymen bring home their work as punctually as the taylor and the shoemaker, but any thing better than journey-work is rarely to be had for bespeaking it. To the solution of a great historical question much previous knowledge and forethought is necessary; they who have acquired this knowledge are not likely to give the result in a manner prescribed for them; they who have it not can produce nothing that is valuable. College essays are one degree above school-boys' themes, and academical essays one degree above them: the candidates have to read for the subject; they are volunteers who must be drilled, not soldiers ready for service; instead of feeding the mind they cram it, as turkeys are served before Christmas, and all that comes forth is crude and indigested: the understanding has had no time to concoct and assimilate what has been stuffed in. The Teylerian society has not yet decided any one of the disputed points of theology, and all the poets who have emulously contended for the profits of Mr. Seaton's Kislingbury estate, have not done quite so much honour to Cambridge as Edmund Spenser, who could not get a fellowship there, or as John Milton, who was whipt across the buttery hatch.—Prize rams and prize oxen may be had at reasonable notice, but the attempts at rearing prize poets and prize philosophers do not seem to have succeeded so well.

All rules, it is said, have their exception, and we are truly pleased, that fortunately in this case, the exception lies before us. Of all countries in the world we should least have expected a satisfactory dissertation on this subject from France, a land wherein rational religion seems never to have been known, and of all times least should we have expected it at the present, when Bonaparte, most probably a bigoted catholic himself, has restored catholicism, shorn of its beams indeed, but still the same in spirit, still with transubstantiation and auricular confession, a Latin service and a celibate clergy. But France is hardly entitled to the credit of this work: she sent the seed indeed, and has received the fruit of the tree, but the tree itself was reared and the fruit matured in a better country. M. Villers is German in his studies, his opinions, and his philosophy. He is a pupil of Eickhorn's school, and he has learnt in that school a theology which no other could have taught him.

It augurs well for France that the national institute should have proposed such a question, still better that they should have awarded the prize to so truly liberal and enlightened an essay. A very remarkable sentence occurs in the commencement of the work: M. Villers observes that the subject regards both religion and politics, which he calls the two cardinal points of the life of man; '*and of the first prerogatives of liberty, is the power of full and unconstrained expression on those important subjects, and in whatever country that power is exercised, infallibly that country is free.*'

With the opinions of the German writers M. Villers has caught a little too much of their method; their over-solicitude for arrangement—of their first- and second-ing, dividing and subdividing, sorting and separating. Order is an excellent thing, but these which are the ornaments of order may well be dispensed with. There is no necessity to label reasonings if they follow in natural sequence. He employs also too much time in clearing the road along which his procession is to pass; this ought to be done, but it should be done before people are assembled to see the show. It is right that he himself should perfectly understand the limits of his subject, but it was by no means necessary that the readers should walk the bounds with him. All that part of the first section, which is to show that every cause is itself an effect of some other cause, till you arrive at a first cause, is mere matter of amplification; that mouthful of froth which disappoints him who would drink.

The second section is upon the essence of reformations in general; here the author speaks of what are the hopes of mankind, and he speaks rationally, religiously, rightly.

"Do we then give permission to him who contemplates the history of the human race, to ask of himself whether tends that succession of tumultuous events, of commotions, and of transmutations in things and in opinions? Let him give free scope to his mind in pursuing the end of so many progressive revolutions. He can find it only in the sublime idea of a state of things, in which the destination of the whole human race being fully consummated, all their physical and moral powers having attained their highest degree of improvement, mankind would be as good, as wise, and as happy as the original qualities of their nature permit. Not that it can be demonstrated that this golden age of mortality, this millennium of philosophy, can ever

realized as the dream of philanthropy ex-
tended to our own imagination. But in the
lot of man, in those of society, we cannot
perceiving a tendency towards the bet-
ter, towards an order of things more just,
and beneficent, in which the rights of every
man are better guarded, and those rights more
equally divided. Let us grant that absolute
justice will never be the lot of mortals ;
at the same time, let us acknowledge
that this perfection forms the ideal object of
nature, that it is a want, a demand of
intellectual nature. It is not clear that
it will ever arrive at it ; but it is certain
they aspire to it. Peradventure the phe-
nomenon of the geometrical asymptote is
destined to be repeated in the moral world,
that we shall for ever approximate to the
ideal without being able to touch it.

Up to our time the species has made
progress ; it is credible that our successors
will be the same. Greece and Italy, barba-
ric in their early ages, were far behind Greece
and Italy in the brilliant days of their improve-
ment.

But however eminent, in many re-
spects, that improvement may have been, it
was peculiar to each of those nations, and ex-
tended with regard to the rest. It belonged
to the citizen of Athens, to the citizen of
Rome. It belonged not to man. All the
inhabitants of the globe were born to an inheritance of
ignorance, and slavery, of practical slavery,
with a few millions of men. Was it im-
possible to be confined for ever to a few
square miles to a narrow corner of the earth ? Were
millions of human beings who vegetated
in the store-house of nations between the Obi
and the Elbe to remain eternal strangers to it,
to be for ever only the swordsmen or
slaves of the privileged orders ? No ;
certainly ! Among them too the dis-
semination of light was to take place ; an inter-
vention was to be formed by which the spirit of
freedom and of Achaia was to be carried to the
Barbarian Chersonese. To accomplish this
it was necessary either that the small
number of people with whom improvement
lodged should subdue innumerable na-
tions, and penetrate to the remotest corners of
the most distant regions ; or that the mass of
civilized nations should conquer the small
number, and become incorporated with them,
in a sensitive place of illumination. After the
first of those means had been tried, and the
light had penetrated as far as was consist-
ent with a power and a virtue worthy of eternal
duration, the second, more natural, was set
on foot by the mysterious Arbitrer of human
fate. The children of the north poured
themselves out upon the south of Europe, and
led their own darkness along with them.
Light appeared to come again. Scarcely
had there a feeble spark of light appear-
ed in the midnight gloom which lasted the
night proportioned to the foreign mass which
survived. Ten ages of fermentation were
necessary to assimilate so many heterogene-
ous elements to the better ingredients which

were blended with them. At last the light
burst forth anew on all sides. During three
ages, since its appearance, it has spread, and
made a progress hitherto unexampled. The
illumination of Athens and of Rome is re-
stored, not only throughout Europe, but at
Philadelphia and Calcutta. Rome, and A-
thens, which our knowledge and our arts would
astonish, would admire also the philanthropy
of Europe, which glories in the feelings of
humanity, and allows not slavery to exist on
its soil. Such are the effects which have re-
sulted from the dismal inundation of the bar-
barians in the fourth century ; and in this
manner does time at last vindicate the ways of
Providence, whose power during the course
of one or even of several generations appears
sometimes entirely to have remitted its action.
It behoved me to make choice of this exam-
ple, because the apparent downfall of human
nature, during the long interval of barbarity
in the middle ages, is generally the favourite
theme on which the adversaries of perfectibil-
ity descant in recommendation of their own
doctrine."

The metaphysics of this section con-
cerning the body and spirit of human in-
stitutions might well have been spared. In
the following we arrive at the real subject
of the essay : it contains a sketch of the po-
litical, religious, and literary state of Europe
at the beginning of the 16th century, and of
the political effects which the reformation
produced, such as breaking down the
power of Austria, which would else have
destroyed the liberties of Germany, es-
tablishing the independence of Holland,
and in fact that balance of power which it
has been the object of all statesmen since
to preserve.

Conjectures follow regarding what would
have happened if the reformation had not
taken place. The state of society in Austria,
in Spain, and in Italy, answers the question.
Fanaticism would every where have con-
tinued to make bonfires of reformers and
philosophers, and pederasty to walk abroad
in purple. Bigots would have persecuted
in stupid sincerity, and mitred atheists
have made a common cause with them
against honesty and truth. Some valuable
facts are mentioned in this chapter which
show that though the giant Pope is by
reason of age, and also of the many shrewd
brushes that he met with in his younger
days, ' grown crazy and stiff in his joints,'
he doth still ' sit in his cave's mouth,
grinning at pilgrims as they go by, and
biting his nails because he cannot come at
them.' The holy see has not to this hour
recognised the king of Prussia. Every
year the pope still doth ' excommunicate
and anathematize, on the part of God Al-

... Trinity, Father, Son, and Holy Ghost, and a ... on our own part for the warrant it seems to have ... it is backed by a ... all ... as also all those who ... the ... of Martin Luther, and ... and ... and ... read the ... of the ... of any other, and in general all their ... in 1792, the ... of Salzburg, ... of thirty thousand of his subjects, because they were protestants, and ... them to carry with them any of their property, or even their families. The banishment of the Jews, and the expulsion of the Moravians, have been paralleled in Germany in our own times! Never let it be ... that if some new Medea were to ... the crazy old giant, he would come out of the cauldron as carnivorous and as blood-thirsty as ever. M. Villers says in one of his notes, 'a striking monument of the barbarity which remained in Catholic Germany at the end of the eighteenth century exists in the narration of the adventures of M. Schad, which has been published by that gentleman, professor of philosophy in the university of Jena, who had formerly been a Benedictine monk in the convent of Banz, whence he made his escape, fortunately for himself and for philosophy, which he still cultivates with success. Yet these monks of Banz were regarded as the lights of catholic Germany. It would be difficult to believe the excess of their superstition, if it were not described by an eye-witness, and one who had himself been concerned in it.' It might be rendering some service to this country to translate the book thus spoken of. Bishop Gardiner has still his admirers in England; convents have been re-established here in defiance of the law of the land, and the children of protestant parents perverted, and induced to enter them. However we have been accustomed to hear the present time called the age of reason, and the age of infidelity, it is more truly an age of superstition.

With this enquiry the first or introductory part of the essay concludes. The second, which bears for its general title 'influence of the reformation,' commences with a chapter upon the political situation of the states of Europe. 'Mens agitat molem' is the motto. Almost immediately after Luther had raised the standard of revolt, the popes lost half the empire, more than half Switzerland, all Denmark, Sweden, Holland, and England; the resources which

they supplied to Rome were instantly off; nor was the successor of St. Peter any longer the tremendous power he had been, even in those kingdoms which preserved their faith. Instead of the law he was now compelled to regulate it, he was now obliged to regulate a reform as the courts of Vienna or Madrid or Lisbon found convenient; and in times to disband his Janizaries, his tried and disciplined band. As his declined, the political influence of the men fled away also. Richelieu and Mazarine are only exceptions. A reform in manners was forced upon the church by the reformation; it has had no effect since; nor was it possible longer for the clergy to remain in their brutal state of ignorance; when they could not enforce they were compelled to try to enlighten. The Jesuits started up, and had its age of learning, for which again it is indebted to the reformation. There would have been no Laynez if there had been no Luther, no Baronius had there been no centuriators at Magdenburg, Bellarmine and Bossuet had there been no protestants.

The reformation furnishes a striking parallel to the political fermentation of later times. Of the protestant spirit M. Villers says, 'what the most imminent danger of the state could not be obtained from individuals, zeal for religion obtained with ease. For the artists, bourgeois, peasants, ran to arms, and not one of them thought of murmuring at the thrice as heavy as those which they had borne before. In the violent agitation into which the danger of religion threw the mind, people offered goods and services, and they perceived not the efforts or burdens with which they would have considered themselves oppressed in a more calm situation: substitute king and constitution for religion; and this is the nature of our associations, and lives-and-death men. Prodigious power was thrown into the hands of those protestant princes, who, like our Elizabeth, knew how to use it; and on the other hand the struggle in catholic countries between the clergy and the crown ceased for ever, and the one leagued itself with the other for the common object of deceiving and oppressing the people, of enslaving the body and soul.

M. Villers briefly notices the jacobinism of the reformation. We find, he says, among some of the extravagant sects, that of the anabaptists, the same protes-

to absolute equality and liberty, as which gave occasion to all the excesses of the jacobins in France. Agrarian laws, the plunder of the rich, formed part of their doctrine also: and on their standards might have been already written, war with castles, and peace with cottages. We have in our possession, a rare curious book, from whence the parallel may be continued. 'It is the very *operte* of comon people, namely of these *maynes*, that what so ever they be persuaded unto, agreeable to theyr affections, they shal be ready, in a sodeyn gyre, to complysh; regarding nether daunger, nor commodite, though sone after they repent them. And lyke as the people of bell brought the jewelless of their wives and chylidern to the makinge of golden calts; so dōd they brynge theyr jewelless, beades, rynges, outches, with pay, both gold and sylver, to the comon hutches so haboundantly for this prodigion, that men doubted, in some place, whether they had poore folke sufficient to consume so excedynge heapes of ryches. At this dout was sone made a playne way; for within a whyle after, the argente heat of theyr lyberall devocion waxed cold; and because they contynued in the same styll in bryngynge in theyr oblations, the hutches and coffers were emptye ere they wist it. Then whyles it was considered what way myglite be beste taken for the preservation of this ordynance, that it shuld decaye, to theyr confusion that began it; some gave counsell that it should be necessarye to depryve the clergy of theyr goodes, and to distribute theyr possessions, landes, and rentes, among lay people, and to throwe downe all monasteries, and churches, makinge coynce of crosses, chalesses, and other sacred revels, for the sustentation of the poore, as they alleged.*

M. Villers does not do justice to these jacobins of the reformation. Voltaire says, and says truly, of the manifesto which Muncer drew up for them, that it might have been signed by Lycurgus. It is a system, says Robert Robinson, of justice, virtue, and happiness; and so equally dis-

tributed, that it is impossible to know any thing more of the religion of the authors, than that they were christians, who held themselves bound to make the holy scriptures the rule of their actions. And he bids us compare their memorial with the Augsburg confession; each article of which begins with *docent*, and ends with *dammant*. They deserved a more respectful mention, in spite of the excesses to which they were induced by madmen, who can, in all ages and all countries, find followers enough. When we execrate the excesses of the peasants in Germany, and of the jacquerie in France, the heaviest portion of the curse should fall upon the oppressors who provoked them. The insurrections in our own country, under Wat Tyler and John Ball, were disgraced by no such enormities. England was free from the reproach of national cruelty till the accursed proceedings in Ireland.

Notwithstanding, however, the war of the peasants, Germany was infinitely indebted to the reformation. It served Charles V. as a pretext for attacking those states of the empire which were hostile to his ambitious projects, and he probably regarded it as a happy circumstance. But it gave them tenfold strength; it united them in an indissoluble bond of union; the liberties of Germany were saved; and the consequence is—that there is now broad sunshine in Saxony, and candle-light in Austria—that what Eickhorn publishes at Gottingen is prohibited at Vienna. This very essay will, no doubt, be included in the list of prohibitions, and it is not our fault if the Annual Review be not thought deserving of the same honour.

M. Villers asserts, that Prussia owes much of its popularity, and much of its success, to its religion. In Silesia, and in all the Austrian dominions, the number of secret protestants, the descendants of those who had fought for freedom of conscience, under Zisca and Procopius, was very great. Prussia is every where held up in this volume as the Ormuzd, and Austria as the Ahriman, of Germany. The translator makes some foolish objections to this, which is the prevailing feel-

* The little volume from which this has been extracted is entitled, 'A Dialogue, describing the Originall Ground of these Lutheran Factions, and many of their abuses. Compiled by Sir William Barlowe, Chanon, late Byshop of Bath. Anno 1553.'—There had been an earlier edition. I conceive this volume to be singularly rare; it was certainly not known to the writer of Sir William's life in the 'Biographia Britannica.' Possibly he himself endeavoured to suppress it, when he thought fit to swim with the stream, resign his house to Henry VIII. take an active part in the divorce, and accept one of the new bishopricks. It is a well-written book; the production of a cool, prudent, sensible man, who felt himself well off, and did not wish for any changes in the state of affairs.

ing throughout all the North of Germany; but he states truly, that Prussia, liberal and enlightened as its government is, is still a tyranny, and if the sceptre of Frederick-William should descend into the hands of a fool, or of a bigot, it would become, in practice, what it already is in theory. There is, however, this security, that Prussia owes much of its power to its popularity, and if it cease to be the head of the enlightened party, it would cease to be formidable.

In Denmark, the spoils of the clergy fell to the nobles. Gustavus Vasa availed himself, in Sweden, of the reformation, to strengthen his own power;—his great successor saved the liberties of Germany; but Sweden has, from that day, declined. There is, however, something vital in the country;—its sovereigns have always been remarkable:—that law of nature which produces what the Germans call *kukkerla-kens*, seems not yet to have begun its action there.

What relates to Switzerland is admirably said:

"Republicans and ardent friends of liberty, as were the Swiss, they should, in appearance, have flown to meet a reformation. Seven cantons, however, remained catholic; and another thing remarkable is, that the cantons which were most decidedly republican, were of that number. This phenomenon is not easy to explain by those who are not well acquainted with the local circumstances. It has been already observed, that the catholic religion neither is nor can be in all places the same; being modified in different situations, by the nature and circumstances of each. The catholicism of the little cantons of Schwitz, Uri, and Unterwald, precisely because it was established among those mountaineers, naturally republican, had assumed a form agreeable to their character, and bent itself to their manners. The imagination, besides, of the inhabitants of mountains is lively, and receives a strong impression from external objects. A worship, therefore, clothed with many forms and ceremonies, must naturally please them better than one more simple and severe. Here had lived the founders of Helvetic liberty; and the memory of all the events, and of all the great characters of that epoch, were intimately associated in their fancy with the catholic worship, and its ceremonies. The fields of famous battles, the acts of their ancestors, were on their soil designated, not by obelisks, but by chapels. Who has travelled in Switzerland, and not been to see the chapel of William Tell? A species of idolatry, a national fanaticism, was excited in the little cantons by this mixture of the worship of liberty with that of religion. Such, even at this day, is their catholicism.

They do not even conceive that there is another. The abuses of the church had scarcely been felt among them. The Popes scarcely exacted any tribute of those poor mountaineers; and their priests, being the persons of any information in their villages and towns, acquired, and have still preserved, a great ascendancy in the deliberations of their assemblies, and in all their affairs. To this, that knowledge had made less progress among them than among their rich allies the plains; and that, having already made these, as it were, the present of liberty, they were not in a temper to let them prescribe them a change in their religion."

Geneva also occasions some excellent remarks. "It may be truly affirmed," says M. Villers, "that this little republic has had as great an influence on the destiny and improvement of Europe, as several mighty monarchies.

"This is a new proof of the immense advantage to human nature of little states, and of the employment which is made by their means of the concentrated power of each district of the globe. This proof is repeated at every step in Germany; where we meet with free cities and principalities of moderate extent, all of which have their principle of life, active, peculiar and independent. Each prides itself on making industry, the sciences and arts flourish in its little capital. Universities and schools are multiplied; and knowledge becomes more general in the nation. If truth be persecuted by fanaticism in one quarter, it is only to make a step, and it finds a secure asylum on passing the next frontier. In fine, each state in this confederate system regards itself as something in itself; and by that single circumstance becomes something. Every city, of moderate size, is not struck with a palsy by the idea that it is nothing; that at one or two hundred leagues distance is another greater city, which is every thing, a gulph, in which its labours are swallowed up; a place, where the whole glory of the empire is concentrated in one luminous point, away from which there is no safety; nothing but Herdism, political, moral, and literary, throughout an immense country. Had Athens, had Delphi, Corinth, Lacedemon, Mytilene, Smyrna, not enjoyed this individuality, and had one sovereign city monopolised the whole splendour of Greece, would so many great men, and great virtues, have every where appeared? Had not the arts and muses of Italy every where beheld courts and flourishing republics in their neighbourhood which smiled upon them; had genius not been awakened by immediate celebrity and encouragements at Ferrara, Mantua, Venice, Florence, Guastalla, and Sienna, as at Rome and Naples; had there not been in all Italy but one center, one point; one city, would that country have become, in the arts, the most classical of modern times?"

Holland was disturbed by contending sects, after its independence was secured. It is well observed, that where the prince, as well as the people, became protestant, the old police was maintained with the new religion: an important example to rulers, who had always better lead reformation than be overtaken by it. In the section concerning England, M. Villers is completely misled by Hume.

It is amusing to hear M. Villers talk of the gloomy and inflexible character of the English. What he says of Ireland is unhappily true:

"The reformation, which to other countries has been the source of so many blessings, has been to unhappy Ireland a most disastrous scourge. Treated as a conquered people, and long at the discretion of England, the Irish obstinately remained catholics, precisely because their oppressors were protestants. Their chains were, on that account, rendered the heavier. Their island was filled with rapacious Englishmen, by whom nearly all property was grasped. The despair of these exasperated men at last broke out with fury in 1641. A massacre throughout the island ensued of more than a hundred thousand protestants. Cromwell afterwards took vengeance on them, and delivered up almost the whole island to his soldiers. William III. established there a legal and constitutional tyranny. The catholics were deprived of political existence, of property, and even of education. It pleased England to make of them a horde of gross and barbarous mendicants. It is like barbarians, accordingly, that they have taken vengeance on every occasion which has presented itself. Animositities of this nature remain, and are transmitted through many generations. During the last war, the Irish have sufficiently shewn, that several reigns of toleration have not entirely obliterated their deep resentments."

We now come to the states of which the governments have not embraced the reformation. Spain has been dismembered of its possessions in the Netherlands; internally it has been little changed, for the inquisition is of elder date, and extirpated heresy by one vigorous persecution, which was a mere nothing to its exploits against the Jews. M. Villers says, "the difference between her language, and that of the other nations of Europe, was one obstacle to the new doctrines." It was too slight a one to deserve mention, and in fact, there is as much difference between any other European language, and all its neighbours. There were Spanish protestant writers, but their books were burnt, and themselves too, if they were caught. The state of Spain and Portugal, so far as

regards the freedom of enquiry, (and the consequences extend to every thing,) may, with little hazard, be ascribed to a constitutional disease, not far removed from religious madness, in Isabel of Castile, which became hereditary in her descendants. Such is despotism! the state of one individual's stomach, or gall-bladder, affects the lives and destinies of unborn millions.

Francis the First hated the reformation, because he had sense enough to see that the principles of civil and religious freedom were closely connected, and being a sensual and a bad man, he was of course hostile to liberty and morality. His successors were more bloody than himself; they disgraced their country, and their detestable religion, and human nature itself, by the massacre of St. Bartholomew's, the foulest day in the whole history of mankind. But that throne and that altar which then leagued together for this accursed purpose, were overthrown together by the ultimate consequences of that reformation against which they had so hellishly conspired. The heaven of liberty which Calvinism left behind it ceased not to ferment till it had produced the revolution.

Italy was little affected: it was too immediately under the sword of the pope and of the emperor; and the few reasoning men who did not become either pagans or infidels, retired into other countries. It was the lot of Poland to receive the most illustrious; ignorance has extinguished all that formerly rendered that country illustrious, and the socinians exist no where in any strength but in England.

Second Inquiry. External Situation of the States of Europe in regard to one another.—The religious struggle produced the balance of power, France siding at first with the protestant princes, and calling in the Turk, because France has always made religion subservient to policy. M. Villers thus recapitulates the effects of the reformation, in regard to politics.

"Europe, plunged during several centuries into stupor and apathy, interrupted only by wars, or rather incursions and depredations, without an object useful to the human species, all at once receives new life and activity. A mighty and universal interest agitates the nations; their powers are unfolded; and their minds opened to new political ideas. Preceding revolutions had thrown into action only the arms of men, this set their minds also to work. The people, who till now had been counted only as cattle, passively subject to the caprice of their leaders, begin to act from themselves, and to feel their own importance and utility. Those who embrace the

reformation make a common cause with their sovereigns, and hence arises a close union, a community of interest and action between the prince and his subjects. Both are for ever delivered from the excessive and burthensome power of the clergy, as well as from the struggle, injurious to all Europe, and which lasted so long between the popes and the emperors, for the supreme dominion in that quarter of the globe. The social order is regulated and improved. The Austrian power is restrained within due limits; that of France is raised and opposes it; the importance of durable alliances begins to be felt; the bodiless politics of Europe form a connected system in which one part is balanced by another; a whole regularly organised, of which formerly not even an idea was conceived. States, such as Sweden and Turkey, which scarcely till that time existed with regard to the rest, obtain rank and importance in that system. Others, such as Holland, are at once produced by the mighty shock, and from the beginning acquire preponderance. The foundations are laid of the Prussian monarchy, and of the American republic. In politics a general spirit is formed which embraces all Europe. The art of negotiation is improved; becomes more frank and more certain; and the course of affairs more clear and simple. In this state of union and contact, commotions and wars become more general, but they become also of shorter duration, and their rigour is softened by better and more humane laws of nations.

"In one part of Europe the church ceases to form a foreign state within the state; whence it is easy to foresee that this change will every where be produced; and that the head of the church will be confined to the mere spiritual supremacy. Finally the catholic clergy reform their conduct by the example of the protestants; and they gain in morals, in knowledge, and esteem, what they lose in power and riches.

"At the same time all the governments in Europe increase their internal power; those which are protestant by the union which they form with the mass of the people, and by the wealth, prerogatives, and jurisdiction of the church, upon which they seize; those which are catholic by placing themselves on a formidable footing of war, by reducing the protestants in their own dominions, and thus subduing one part of their subjects by the other, the citizens by the soldiers."

The consequent progress of knowledge is next investigated. The church of Rome said, Submit, without examination, to authority; the protestant church said, Examine and submit only to thine own conviction. Protestantism, says Greiling, is the repulsive power with which reason is endowed to remove and throw off whatever would occupy its place. The first and immediate improvement was in theological studies, which M. Villers, after the

German school, divides into *catechetical* and *homiletical* and *exegesis*, or the critical examination of the text of scripture, of which the *hermeneutical* is a part. The translator has taken occasion here to introduce a very bigoted and unnecessary note. The state of the protestant clergy is then described:—"protestant theology," says the author, "rests on a system of examination, on the unlimited use of reason. It regards the doctrinal part reduced to purity and simplicity as only the body of religion, the positive form which it requires; and it is supported by philosophy in the examination of the laws of nature, of morality, and of the relations of man to the Divine Being. Whoever wishes to be instructed in history, in classical literature and philosophy, can chuse nothing better than a course of protestant theology."

In regard to Philosophy and to the Moral and Political Sciences.—The Romish church has always persecuted philosophy, as well before as after the reformation. Witness Roger Bacon and Galileo, Jordano Bruno, and Vanini. If indeed a philosopher would work miracles like Thomas Aquinas, or sport problems concerning the Virgin Mary, like Duns Scotus, he might then metaphysicize as deeply as he pleased. But the reformation necessarily led to free inquiry; Luther might banish Muncer, Melancthon might cry out against the fanatical anabaptists for disbelieving the devil, and Calvin might burn Servetus, but the flood-gates were opened, and who was to stop the waters? Muncer and Socinus, Middleton and Eickhorn, are the legitimate successors of Martin Luther, though Martin would have bespattered them as furiously with his ink as he did the devil with his ink-stand. In this section M. Villers candidly admits that the number of thinking men who have appeared in France is very limited; and he asserts that the philosophical spirit has for a course of years seemed dead in England. This truth excites the indignation of the translator, who talks loudly of Reid and Beattie. Morals have necessarily been better understood since the casuists have been laid aside, political science partakes of the general progression, and has been so far, and only so far, affected by the reformation. The same may be said of the physical and mathematical sciences. Fine literature owes to it the German and English bibles, which have fixed those languages.

The fine arts have suffered every where, and in Scotland they have been extirpated;

that country is an exception to every thing which has been asserted of the benefits of the reformation; the reformation produced nothing there but degradation, fanaticism, and barbarity. John Knox was the Marat of the reformation.

Consequences of the events which accompanied and followed the reformation. Disturbances and wars in the political world; controversies in the theological world. The argument against the reformation, from the wars which it occasioned, is nugatory and contemptible; it was the occasion of these wars, not the cause, and the result has been favourable to the liberties and to the happiness and virtue of mankind. These wars produced a long exhaustion in Germany, indeed every where. Sweden and Spain are the only countries which have not recovered it. The Austrian dominions are the only part of the world which has, in every respect, suffered by these wars, but they alone who opposed the reformation are guilty of all the evils which resulted from it. In like manner it was the occasion, not the cause, of much theological controversy; by which, however, no harm is done. It is not indeed the best way of using white paper; but they who have ever seen an income-tax schedule, know that it is not the worst.

A curious section traces the secret societies of free-masons, Rosycrucians, and illuminati, to the necessity which persecuted sectarians were driven to, of secret meeting and signs of recognition. It is added, that there will soon appear a work in Germany, by M. Buhle, which will certainly establish what is thus advanced, and exhibit all the proofs. Some very curious remarks upon this subject may be found in the Monthly Review (xxv. p. 50.) in the review of Barruel, one of the ablest articles that ever appeared in a work of periodical criticism.

The Jesuits furnish the subject of another section, for this association of religious antijacobins is certainly to be placed among the effects of the reformation. Their system of education is thus admirably developed.

“ Their directing principle was to cultivate and carry to the highest possible degree of perfection all those kinds of knowledge from which no immediate danger could result to the system of hierarchical power, and to acquire by this means the character and renown of the most able and learned personages in the christian world. By means of this command of the opinions of men, it became easy for them either to prevent the growth of those

branches of knowledge which might bear fruit dangerous to the papal power, or to bend, direct, and graft upon them at their pleasure. Thus by inspiring a taste for classical learning, profane history, and mathematics, they contrived dexterously to extinguish the taste for enquiry into matters of religion and state, the spirit of philosophy and investigation. The philosophy taught in their schools was calculated to excite aversion and disgust. It was no other than the scholastic system, reviewed and corrected by them, applied to present circumstances, and the controversy with the reformers, whose arguments, it may well be supposed, were always there presented in a manner to fall before the artillery of the schools. With regard to the study of religion, it was confined to the books of theology composed for that purpose by the members of the society, to the casuists, and the Jesuitical moralists. The study of the original charters of religion was prevented; or if the gospels and other pieces appeared sometimes in the books of devotion, (and this it was impossible to avoid, when the translations given by the protestants were public,) they were accompanied with interpretations, and even alterations suitable to the main views of the society. Their great watchword was the utility of the sciences, and the beauty of the belles-lettres. All that relates to the moral improvement, to the ennobling of human nature, all that relates to the philosophical and theological sciences, the Jesuits endeavoured, and in reality were enabled, to retain in oblivion; to render theology as well as philosophy a barbarous system of subtleties, and even ridiculous to men of the world. How can it be determined to what a degree this jesuitical mode of instruction, which became the prevailing mode in catholic countries, and differs so prodigiously from the mode of instruction among the Protestants, modified the species of culture, and the particular turn of mind in Catholic countries, so different in general from what is discovered in the Protestant? From all this however it follows (and this consideration appears to me the key of the very contradictory judgments passed on the plans of the Jesuits in the cultivation of the sciences) that this society performed immense services to certain parts of literature, which it improved; but that on the other hand, it retained, designedly, certain other important parts in the dark, or so obstructed the avenues to them with thorns, that nobody was tempted to enter. Thus, considered generally, the instruction given in their schools, very brilliant in one respect, continued very dark in another, was a system partial, incomplete, and which set the mind in a wrong direction. But, as on the one side all was clearness, and illumination, and on the other all mystery and obscurity, the eyes of men were naturally directed to the illuminated side, and disdained to dwell upon the other, which they acquired the habit of considering as altogether insignificant.

"To model science according to the interests of the pontifical power, and render even science ignorant in all things in which it was requisite that she should be ignorant; to produce some things in the clearest light, and to retain others in the thickest darkness; to fertilize the kingdoms of the memory and the imagination, by rendering that of thought and reason barren; to form minds submissive without being ignorant of any thing but what could effect their submission; like those highly valued slaves of the great men of antiquity who were grammarians, rhetoricians, poets, fine dancers, and musicians, and knew every thing except how to become free; I cannot fear that I shall be contradicted by any impartial man, in stating that such was the system of instruction adopted by the Jesuits. It was ingenious, and inimitably adapted to the end they had in view. It was calculated to form illustrious, and elegant authors, learned men, orators, good Roman Catholics, Jesuits, if you please, but not men in the full acceptance of that term. He who became a man under their management, became so independently of that management, and in spite of it."

As the Jesuits opposed the reformers, and the Jansenists opposed the Jesuits, M. Villers ascribes all the fruits of this latter rivalry to Martin Luther. Without the reformation, he says, there would have been no Jesuits, and without the Jesuits no Port Royal; thus the works of Arnauld, Tillemont, Pascal, &c. are among the fruits of this prolific seed. This is something like the connection between the priest all shaven and shorn, and the rat that eat the malt that lay in the house that Jack built. There is no end of these remote consequences; the price of nutmegs is one, and the archbishop of Canterbury's wig is another.

Reflection concerning the uses made of the wealth of the church. M. Villers regrets the little good use that has been made of this treasury, and yet he supposes the distribution in our own country to be more judicious than it really is; thus much however we may fairly boast, that in no country has it been better applied. The Essay terminates with a brief recapitulation, in which the author ends as he began, by shewing that the reformation, so active a cause to succeeding ages, was itself an effect of the spirit of its own age. What Dante and Petrarca were to poetry; Michael Angelo and Raffaello to the arts of design; Bacon and Descartes to philosophy; Copernicus and Galileo to astronomy; Columbus and Gama to geography; the same was Luther in regard to religion. All were the first characters of

their respective ages, but their age was ready for them.

A sketch of the history of the church down to the reformation is appended, it might with more propriety have been prefixed. We shall transcribe from this the character of the great founder of christianity, as perfectly explanatory of the author's system of belief.

"He preached with the tranquil majesty of a mind invested with a superior mission, and which had no other business on the earth, but that of establishing truth, piety, and love among mortals. Serious and circumspect in his actions, ingenuous, simple, and sublime in his discourses, his mind appeared calm, transparent, and profound as the ether of heaven. Supremely mild and benevolent, a holy zeal against impiety and vice could alone move or affect him with passion for an instant. Thus is Jesus described to us by his four historians. If he was not such, undoubtedly we must admire the genius of those who imagined so fine a picture, and still more the happy chance by which the same picture presented itself exactly to four evangelists, who, in all probability, could not each copy from the other. But if he was such, as it is impossible to doubt, what then was the nature of this extraordinary being, who resembles none of the great personages represented to us in history, and whose life, without blemish and without affectation, exhibits not one of the weaknesses of human nature?

"Jesus, during the few years of his public ministry, sowed the imperishable seeds of a doctrine of pure adoration, of love and justice; or rather he only sanctioned and vivified those seeds naturally sown in every heart. And what is not less wonderful and extraordinary than his whole mission and character is, that a Jew, a member apparently of a nation unparalleled for its selfishness, its exclusive spirit, and its enmity to the rest of mankind, first presented the notion of an universal religion, of a church for the human race, of a fraternity of all men under the authority of a common father. One father, one family, one service, one love; this idea was miraculous in that age; it was so in a much greater degree produced and established in Judea. Jesus offered it as his only precept; explained, and applied it to every case. He gave charge to his apostles, plain, unlettered men, to go and diffuse it among all nations, declaring to them that every where its effects would be great. They go, they speak, and the world becomes christian. Jesus meanwhile, pursued by the fanaticism of the priests of the ancient law, was the same amid executioners and torments which he had been in the midst of his disciples, a pattern more than human of patience and firmness, of mildness and sublimity. "Father," said he, praying for his executioners, "Father, forgive them, for they know not what they do." This last proof was wanting to enable him to offer a practical example of

the most difficult virtues. After this nothing more remained for him to do: all was finished to use his own expression; and he died the noble death of a martyr to truth and virtue."

The whole of this sketch displays a thorough knowledge of ecclesiastical history.

M. Villers has touched lightly upon the evils which the reformation has occasioned; he specifies its injurious effect upon the fine arts, and nothing more. A worse evil is the total stop which it has hitherto put to the progress of christianity; the Danish and Moravian missions are too unimportant to be considered as exceptions. Protestantism wants all the implements for conversion. The Jesuits trained up men for the purpose, always either the most enthusiastic or the most able of their body, and not unfrequently both qualities were found united. Celibacy enabled these adventurers to carry their lives loose about them, they looked on to martyrdom as to the highest blessing, and to canonization as the highest summit of earthly glory—thrones in heaven and altars upon earth were to be their reward. But the Protestant church militant would find but few of its soldiers ready to volunteer upon the forlorn hope. The missionary from a reformed country, sets out with only his own stock of zeal, there are no cooler heads at home to direct him; he has no order to share in the glory of his success, or sing triumphant hymns for his martyrdom; he sees no charms in the stake and the foss, and worst of all, he has no tools to work with, no idols which he can offer to the idolator in exchange for his old gods. It is the state which must convert Hindostan and Polynesia, not the church.

The reformed churches may also envy the admirable skill with which Rome enlisted into its own service all such fanatics as create sects in protestant countries. The Wesleys and Whitfields of catholicism have been the founders of new orders, or the reformers of old ones, and proved its most useful labourers. In that wonder-

ful system of imposition every thing was made useful. The church of Rome sent enthusiasts abroad to extend its empire and be made its martyrs; and those who were too mad for any thing else, it kept at home to feed upon bread and water, flog themselves, wear hair-cloth, see visions, receive revelations, and become saints. Our Bridgets and Gertrudes go to Bedlam, and our Junipers to the parish work-houses.

It has been said, that the reformation was premature, and would have been more effectual had it been delayed; but the example of France does not prove that any great changes in the state of the church are conducted in these times more moderately, more wisely, or to better end, than they were in the sixteenth century. Popery never could have fallen without violence. As for its reforming itself, have we yet to learn that reforms are never to be expected from within; that for goitres and cancers there is but one cure?

That the reformation has not been complete we may acknowledge. What however may be farther wanting in our own country is in the body, not the spirit of the church. Our clergy have kept pace with their countrymen in improvement. Consubstantiation may be in the articles, and transubstantiation in the catechism; but neither do the men who subscribe to the articles think of the one, nor the children who repeat the catechism of the other; they are not insisted upon as points of faith, and they form no part of the national belief. Were the church of England to improve the condition of its inferior clergy, and to make its articles correspond with its actual belief, its friends would have little to wish, and its enemies nothing to hope.

Mr. Lambert's translation has a life of Luther prefixed, which, if not more necessary than Mr. Mill's notes, is not quite so worthless. It is from a later edition, and contains a preface of M. Villers, which shews that his book has excited, as might be expected, some controversy.

ART. XLIX.—*An Attempt to illustrate those Articles of the Church of England which the Calvinists improperly consider as Calvinistical. In Eight Sermons, preached before the University of Oxford, in the Year 1804, at the Lecture founded by J. BAMPTON, M. A. Canon of Salisbury. By RICHARD LAWRENCE, LL. D. of University College. 8vo. pp. 460.*

It has been justly remarked by an eminent theological professor of one of our universities, that in order to ascertain, or to approach to the primitive sense of our

articles, we must put ourselves in the place of those who compiled them. This is precisely what Dr. L. has attempted in the lectures now before us. He is not

indeed the first, as he acknowledges, by whom this mode of illustration has been adopted; but he has been much more diligent, and much more successful, than those who have preceded him. We will endeavour to give in a brief but faithful sketch, the result of the dry and laborious investigations through which he has been necessarily led in determining the state of religious opinion at the beginning of the reformation in England.

The nature and extent of his design will be evident from the following passage in the first sermon.

"On one hand it has been contended, that our articles are consonant with the creed of Calvin; on the other with that of Arminius. It is not my intention to follow this controverted question into particulars. Yet perhaps it should be cursorily remarked, that even the Calvinist has proved in the most convincing mode, that they are not in their necessary construction completely calvinistical; that something is wanting in them to produce entire satisfaction; for repeatedly has he laboured, although constantly laboured in vain, first to render them explicit on this head, and afterwards to get his favourite emendations approved and established by public authority. But with these points the elucidation, which I propose, is by no means connected. It will be confined to a comparison of our articles with the prevailing opinions of the times when they were composed, at least with those in which they immediately originated, or from which they were collaterally derived.

"If we contemplate them in this view, or rather such of them as will become the subject of investigation, we find, that far from being framed according to the system of Calvin in preference to all others, they were modelled after the Lutheran in opposition to the Romish tenets of the day. The whole scope, therefore, of my design will be, instead of considering them abstractedly, to survey them relatively, with reference to the particular tenets alluded to; and the principal part of my observations will consist in developing these, if not minutely and in full detail, yet sufficiently for the purpose of illustration. But before I proceed to explain the selected doctrines, it will be requisite more at large to point out the real basis upon which the superstructure of our church was raised; and then to give the evidence which the articles themselves exhibit of having been erected upon the same foundation."

The English reformation, which, as is well known, commenced under Henry VIII. was completed, according to Dr. L. in all its essential parts under Edward VI. No subsequent alteration of any importance took place. The original, after which it was moulded, was the Protestant

establishment in Germany. The "men of the new learning," as the English Protestants were called, were all Lutherans; and many attempts were made, both by Henry and Edward, to gain the personal assistance of Melancthon. The two most important publications of Henry's reign, the Bishop's Book and the King's Book, with the exception of a few points breathed the spirit of Lutheranism. "Upon the accession of Edward the offices of the church, observes Dr. L. were immediately reformed (which before had been but partially attempted) after the temperate system of Luther, and not after the plan of subversion, rather than of reformation, which Calvin had recently exhibited at Geneva. Nor were any alterations of importance, one point alone excepted, made at their subsequent revision. At the same period also the first book of Homilies was composed: which, although equally Lutheran, yet containing nothing upon the subject of the sacramental presence, has remained without the slightest emendation to the present day." p. 15. Soon after this Cranmer translated a Lutheran catechism, which he edited in his own name, dedicated to the king, and strongly recommended as a treatise admirably adapted to improve the principles as well as the morals of the rising generation.

"On the whole, therefore, the principles, upon which our reformation was conducted, ought not to remain in doubt: they were manifestly Lutheran. With these the mind of him, to whom we are chiefly indebted for the salutary measure, was deeply impressed, and in conformity with them was our Liturgy drawn up, and the first book of our Homilies, all that were at the time composed."

The articles, Dr. L. asserts, were drawn up by Cranmer, after the model of "that boast of Germany and pride of the reformation, the confession of Augsburg." Upon one point only, the doctrine of consubstantiation, a deviation from it was made; and upon this point the author of the confession was himself suspected. Of their subsequent history Dr. L. observes,

"When a permanent system of faith was settled by the clergy assembled in convocation under Elizabeth, the see of Canterbury was filled by Archbishop Parker, who as an antiquarian and Saxon scholar still ranks high in the republic of letters. Nor as the restorer of our church did he acquire a less solid, if less brilliant, reputation. Called by the providence of God to rebuild the walls of our Zion, rudely subverted by papal bigotry,

he neglected not the revered materials of the former fabric. After the revival of our liturgy, his attention was directed to the consideration of speculative questions: and here the temperate proceedings of the assembly, which discussed them, seemed perfectly to correspond with his most sanguine wishes. Instead of entering upon the task of innovation, instead of bringing forward a new code of doctrines, which some might have thought more adapted to the improved state of religious taste and sentiment, the convocation was satisfied to tread in a beaten path; it not only made the articles of Cranmer the basis of the proposed system, but adopted them in general word for word. Of what was the intention in this respect no testimony can be more conclusive, than the evidence of the original document itself, which is still preserved with the signatures of the clergy annexed to it, and which is nothing more than an interlined and amended copy of the formulary, which had been adopted in the preceding reign.

"Whatsoever then might have been the dispositions of a few overzealous men, the members of this important convention displayed a remarkable proof of their moderation and judgment, by generally reviving what had been before established, rather than, in order to gratify the restless spirit of innovation, by inculcating novel doctrines. Instead of increasing the number of the articles, they diminished them; instead of extending their sense, so as to make them embrace a greater proportion of speculative tenets, they contracted them, and appeared in every case more disposed to extinguish difference of opinion, than to augment it by adding fuel to a flame, already rising above controul. In one or two instances indeed additions, or rather additional elucidations, were admitted. Of the tendency however of these we cannot doubt, when we learn that, with the exception of one obvious topic alone, they were not original; that they were neither the productions of Parker nor the convocation; and that they were not borrowed from any calvinistical or Zuinglian, but from a Lutheran creed. The creed to which I allude is the confession of Wirtemberg, which was exhibited in the council of Trent the very year, when our own articles were completely arranged by Cranmer. That their resemblance to this composition should have been hitherto overlooked is the more remarkable, because it seems too visible, one would conceive, to have escaped the notice of the most superficial observer. For it was not confined to a mere affinity of ideas, or the occasional adoption of an individual expression; but in some cases entire extracts were copied, without the slightest omission or minutest variation.

"If then we duly weigh the facts, which have been stated, and the consequences which seem to result from them, we shall not perhaps be at a loss to determine, from what quarter we are likely to collect the best materials for illustrating the articles of our church.

We perceive, that in the first compilation many prominent passages were taken from the Augsburg, and in the second from the Wirtemberg confession; the latter not being considered as a retraction of the former, but rather, what only it professed to be, as a repetition and compendium of it. These were the creeds of Lutherans."

Dr. Lawrence further remarks:

"To the writings of Calvin it will be in vain to apply, as some have done, from any conception, that our clergy in the last revision were eager to propagate the new principles, which they may be supposed to have imbibed during the sanguinary persecution under Mary. For, as if distrustful upon this head, the prudent restorers of our church, unless on an individual question, where the interests of truth forbade a compromise, kept the creed of a different communion in view; the creed likewise of an æra prior to that event, which, by compelling many of our proscribed countrymen to take refuge on the continent, particularly at Geneva, laid the foundation of a controversy respecting discipline and the forms of divine worship, which long disturbed the tranquillity of our ecclesiastical establishment, often threatened its existence, and once actually subverted it. But to the name of Calvin, whose talents even prejudice must confess to have been not inferior to his piety, but whose love of hypothesis was perhaps superior to both, from the celebrity which it afterwards acquired, too much importance has been sometimes annexed. It has been forgotten, that at the time under contemplation, the errors of the church of Rome were almost the sole objects of religious altercation, no public dissension of consequence having occurred among protestants, although thinking variously on various topics, except upon the single point of the eucharist: and that Calvin's system upon this had not obtained its full reputation, his controversies upon the subject not being then in existence; controversies, which first began to perpetuate his name, and to render Calvinism a characteristic appellation. Nor has it been sufficiently observed, that his title to fame on this occasion arose not so much from his opinions themselves, which differed but little, except in terms, from what had been before advanced by Bucer and other mediators between the two extremes of a corporeal and a spiritual presence, as from the perspicuity, with which he explained, and the ability, with which he defended them, when attacked by the Lutherans, who had not yet entered the field of combat against him. But no more convincing evidence, perhaps, can be alledged, that the incense of flattery, which was afterwards abundantly offered up, had not then been received, than the total silence respecting him preserved by a contemporary writer, who seemed pertinaciously attached to all his opinions; I mean the well known author of an Ecclesiastical History, containing the acts and monuments of martyrs. From

the voluminous production alluded to, it appears not that any of those, who suffered in the reign of Mary, were accused of having adopted the sentiments of Calvin; but either of Luther or of Zuingle: nor does the prolix historian himself, while he dwells in detail upon the writings and merits of both the latter, distinguish the name, or attempt to immortalize the memory, of the former.

"It was indeed more to his theory of predestination, than to that of the sacramental presence, that in process of time he was indebted for his renown. Even this however, at the period under review, had not passed the controversial flame, from which, in the estimation of his zealous adherents, it came forth with additional brilliancy and purity. It was not then, as afterwards, the object of applause, but, on the contrary, of disapprobation. For his doctrine of *God's dreadful decree*, which before had attracted little notice, was then beginning to give offence both within and without the territory of Geneva. *Dreadful* I term it, as being no less so to his feelings, than to ours; for the same strong epithet he himself applied to it. '*Horribile quidem decretum fateor*,' were the precise expressions which he used, when shuddering at his own favourite idea of irrespective reprobation."

In this passage there is an inaccuracy. In the last examination of Mr. John Philpot before Bishop Bonner, the Bishop of Coventry thus addresses him: "Your church of Geneva, which ye call the Catholic church, is that which Christ prophesied of."—To which Philpot replies, "I allow the church of Geneva, and the doctrine of the same, &c."

In his fifth examination also, he asks his persecutors, "Where is there one of you all that ever hath been able to answer any of the godly learned ministers of Germany, who have disclosed your counterfeit religion? Which of you all, at this day, is able to answer Calvin's institutions, which is minister of Geneva?" And soon afterwards, "In the matter of predestination, he is none other opinion than all the doctors of the church be, agreeing to the scriptures."—See Fox's Acts, &c. vol. iii. p. 495 and 470.

But Philpot was not a leading man in the work of reformation; and the doctrine of the English church must be proved by the principles of those who compiled her articles and her services.

To Lutheran writers, therefore, Dr. L. turns in preference; and by their aid he proceeds to prove, that the articles upon original sin, works before grace, and free will, as allied to the same, upon justification by faith alone, and upon predestina-

tion and election, were formed, not according to the principles of Calvin, but with a sole regard to the topics on which the Lutheran reformers were at issue with the church of Rome. That the first English reformers would be chiefly solicitous to counteract the errors of the church from which they had separated, we should be inclined to believe previous to examination; and an accurate investigation of their writings appears, agreeably to the whole tenor of the valuable notes which accompany these lectures, to justify and confirm the position. To follow the learned preacher through the whole of his laboured enquiry, to trace after him, even in the slightest manner, the doctrines of the schoolmen upon the above points, to detail the proofs which, from the works of Luther, Melancthon, Zuingle, and Calvin, from the confessions of the earliest protestant churches, and the writings of our first reformers, he has so amply deduced, in order to illustrate and establish the principle of interpretation which he has advanced, would occupy no small number of our pages without doing sufficient justice to our author. We shall therefore forbear, and be content with subjoining the recapitulation, which Dr. L. has himself inserted near the close of his eighth sermon.

"After having completed the illustration which I proposed, it only remains for me to restate, in a few words, the various topics which have been discussed. In adverting, however slightly, to each, we immediately perceive, that the leading object of our reformers in every instance was to christianize the speculations of the schools; to point out, as I have had frequent occasion to observe, the necessity and efficacy of redemption. According to the perverted theology of their opponents, by whom the oracles of divine truth were little studied, and less regarded, the corruption of our nature, as far at least as it relates to the mental faculties, was deemed wholly ideal; by congruous merit we were thought competent to obtain God's favour here, and by condign the fruition of his glorious godhead hereafter; while it was conceived, that on account of both we were predestined to salvation. Fascinated therefore by the potent magic of the schools, when the soul of man surveyed her powers and her prospects, instead of viewing herself as a sinful and fallen creature, contaminated by original, and ruined, beyond all hope of human remedy, by actual depravity, she beheld herself transformed into an angel of light. Contemplating the approbation of heaven, not as a boon to be supplicated, but as a reward to be deserved, she disdained to accept it gratuitously, but claimed it as the recompence of her virtues, and

challenged it as her due. To her own merits she imputed her justification in this life, and her proud title to bliss in the life to come, unmindful of those, which the christian ought alone to plead at the throne of mercy, and which by repentance and faith he makes his own. Nor did her complacency in her own good qualities and superior endowments rest even here. Arrayed in all the dignity of moral excellence, and the graces of genuine piety, she beheld herself eternally present to the eye of God, elected before others for her intrinsic worth, and predestinated to everlasting felicity, because deserving of it. Where, in such a system, is to be found a place for the full, perfect, and sufficient oblation and satisfaction of him, who came to seek and to save that which was lost?

"On the other hand, when contrasted with the scholastical doctrine, in how advantageous a point of view, how much more consistent with Gospel truth, and declarative of Gospel beneficence, appears that of the church of England! The ever-memorable divines, who compiled her offices, and reformed her creed, instead of exercising their talents in abstruse theory and vain speculation, directed their attention wholly to the word of God. Upon this grounding every position which they established, they taught, with no less simplicity than sincerity, that we possess by nature a tendency to evil, which in itself is no innocuous quality, but one offensive to a just and holy God, when abstractedly considered; that we cannot ourselves in any way atone for sin; but that an atonement has been once made for all by the common Saviour of mankind; and that consequently, instead of attempting to expiate it by our own merits, whether congruous or condign, we ought rather, with a lively faith, united to a truly penitent and contrite heart, to trust in the expiation of Christ alone, because something more is requisite than we can perform, to appease the displeasure, and satisfy the justice of heaven. Thus while their adversaries laboured to promote pharisaical pride, and render the cross of Christ of no effect, they solely endeavoured to inculcate christian humility, and to demonstrate the inestimable value of christian redemption; not indeed in a calvinistical sense, as if faith were appropriated to the elect only, for that would have been to exchange one species of personal conceit for another; but in a sense, which both scripture and reason approve, which makes the light of the evangelical as general in its influences, as that of the natural day. For upon the subject of predestination, as well as upon every other, which has been alluded to, their prudence

was not less conspicuous than their piety. Approaching it with reverence, and treating it with circumspection, they indulged not, like many in the church of Rome, and like some who were enumerated among the friends of reformation; in abstruse disquisitions upon the nature of the divine will; they boasted not of a philosophy, which affected to soar above vulgar view, and fix its sublime abode in the bosom of God himself. That he, whom the wonders of created being perplex, who knows not half the wisdom of the meanest insect, that man, equally imperfect as impure, should presume to investigate the arcana of the omniscient mind, appeared to them the height of extravagance and crime. Their feelings recoiled at the idea of passing the boundary, which the scriptures have prescribed, and of exploring without an infallible guide the abyss of the unrevealed godhead; what no human intellect can comprehend, they were contented in silence to adore. Every attempt therefore to explain the will of the unknown God, as he exists in his native majesty, amid clouds of impenetrable darkness, they utterly disclaimed, and spoke only of that consolatory effect of it, which the sacred volumes disclose to us, and represent as certain, the predestination of christians to eternal life. With this express object in view they intimately blended the doctrine of election with the holy ordinance of baptism, including all in the universal promise, and regulating the decrees of God by our assumption or rejection of the christian character; persuaded that the contrary tenet of a predestination by individual destiny is attended with the worst of consequences; that while it furnishes the profligate sinner with a pretext for his vices, it increases the agony of the desponding, whose petitions for mercy and forgiveness seem never to reach the throne of grace, but return to his afflicted soul disregarded, if not despised; adding tenfold horror to his despair."

In one or two instances Dr. L. may have exposed himself to animadversion, but upon the whole the ground he has taken upon this subject seems to be that which alone is tenable. We have endeavoured to give our readers a view of this ground; and having done this we must for the present rest satisfied. The contest is not yet over: other fields remain to be fought; and we shall, for various reasons, reserve ourselves for some future remarks on the respective strength and skill of the combatants.

ART. L.—*Candid Examination of the Rev. CHARLES DAUBENY'S "Vindicia Ecclesie Anglicanae, in which some of the false Reasonings, incorrect Statements, and palpable Misrepresentations in a Publication, entitled, 'The True Churchmen Ascertained, by JOHN OVERTON, A. B.' are pointed out." With Occasional Strictures on the above-mentioned Work of Mr. OVERTON. 8vo. pp. 141.*

ART. II.—*Four Letters to the Editor of the Christian Observer, being a Reply to that Author's*

'Occasional Strictures on the True Churchmen Ascertained;' in his *Candid Examination of Mr. DAUBENY'S Indicia Ecclesie Anglicana, with incidental Remarks on Dr. Kipling, Mr. Daubeny, the Reviewers, &c.* By JOHN OVERTON, A. M. Rector of St. Margaret and St. Crux, York. 8vo. pp. 106.

THE first of these publications is little more than a transcript of the review of Mr. Daubeny's work, which appeared in the *Christian Observer* for 1804; and we must do our brother-reviewers the justice to observe, that it proves them worthy of the place they occupy in the republic of letters. The charge of false reasonings, incorrect statements, and misrepresentations, which Mr. D. had urged against Mr. Overton, is here successfully retorted upon himself; and he is proved to be utterly unfit for the management of a question which requires sound judgment, patient and accurate reading, a candid temper, and a love of truth rather than of victory.

The occasional strictures have given some offence to Mr. Overton, and he has come forth in vindication of himself, not only against the reviewer in the *Christian Observer*, who, if not a partizan, is a friend to the cause which Mr. O. supports, but also against avowed enemies, such as Dr. Kipling, Mr. Daubeny, and some anonymous opposers. He has conducted his defence with much ability; he has shewn that the author of the strictures

has fallen into error with respect to some parts of his former work; and he has entered upon a further explanation of his views on some points, on which he was liable to be mistaken. A critique upon Dr. Kipling's pamphlet, published in a former volume of our work, is slightly noticed and reprehended by our author. We see no reason to retract the opinion we then offered. Supposing, what we had every reason to suppose, that by calvinism Mr. Overton meant the distinguishing doctrines of the Genevan reformer, we were certainly justified in representing the reasoning of Dr. Kipling as "demonstrative and incontrovertible." If Mr. Overton and his party disclaim any attachment to what we have been accustomed to regard as the true characteristics of the disciples of Calvin, they should contend no longer for a calvinistic interpretation of the articles. Much of this controversy might be avoided, were the disputants careful accurately to define the leading terms they employ, and with more precision to point out the subjects of debate. But of this hereafter.

ART. LII.—*A Memoir of the Proceedings of the Society called Quakers, belonging to the Monthly Meeting of Hardshaw in Lancashire, in the Case of the Author of a Publication entitled, a Narrative of Events which have lately taken Place in Ireland, &c.* By WILLIAM RATHBONE. 8vo. pp. 92.

IN our last volume we noticed at some length the "narrative" mentioned in the above title, and stated the general opinion, that it was the production of an eminent merchant in Liverpool. This opinion has been at length confirmed by the appearance of Mr. Rathbone's name. Considering the general tendency of the narrative to excite a disapprobation of the proceedings that were detailed in it, the liberal spirit of the narrator, and the dispositions which have lately prevailed in the society of Friends, no uncommon foresight was requisite to warrant an expectation that the case of the expelled members in Ireland would soon be also the case of their apologist and historian. If any reader of the narrative formed that conjecture, (and what reader did not?) he will find it verified in the present memoir. The narrative was published on the 30th of March 1804. On the 24th of June following, the overseers of the congregation in Liver-

pool stated to William Rathbone their regret that such a book should have appeared; that it had also given great pain to the society, and that it was much to be lamented that he had not consulted some judicious friend prior to its publication. A report of the publication was laid before the monthly meeting in August; various visits and conferences took place; the usual formalities were observed; and the business terminated with the *disuniting of William Rathbone from membership*, in a monthly meeting held at Manchester, February 28, 1805.

The greater part of the pamphlet now before us consists of a letter addressed to the monthly meeting of Hardshaw, in answer to the charges brought against the author of the "narrative." To an unprejudiced reader we doubt not it will appear satisfactory; while, together with the rest of the memoir, it will shew the dangerous tendency of what is called church

discipline, and the lamentable possibility of the union of ecclesiastical tyranny with a studied simplicity of manners, and a professed abhorrence of priestcraft.

ART. LII.—*A Defence of the Christian Doctrines of the Society of Friends, against the Charge of Socinianism: and its Church Discipline vindicated, in Answer to a Writer who styles himself Ferax: in the Course of which the principal Doctrines of Christianity are set forth, and some objections obviated. To which is Prefixed, a Letter to John Evans, the Author of 'a Sketch of the Denominations of the Christian World,' and Strictures on the Eighth and Ninth Editions of that Work.* By JOHN BEVAN, Jun. 8vo. pp. 275.

WE noticed in our second volume, p. 154, one of the tracts against which this volume is written. The point at issue is a question concerning the opinions of Penn, Barclay, George Fox, Isaac Pennington, Claredge, and Morris, who are quoted on both sides as our old divines used to quote St. Ambrose and St. Augustine. It is curious to see the society of friends producing the authority of their fathers!

Thus much seems clear. The quakers have no confession of faith, but they are

assuredly entitled to silence any of their preachers who shall preach doctrines contrary to the received and general opinions of the society. If the separatists were numerous enough, they might form a distinct sect like the general baptists, but for this they have neither numbers nor zeal. They incline to the reasonable side, and reason is not the rock upon which churches and meeting-houses are built. Which is right or which is wrong in the point of doctrine, we shall not pretend to say.

ART. LIV.—*A View of the Old and New Way of Doctrine, Discipline, and Government, in the Churches of Christ, including Remarks on Baptism, the Lord's Supper, the Plurality of Elders, their Ordination, &c. &c.* By DAVID M'RAE, A. M. 12mo. pp. 204.

MR. M'RAE, it appears, had not long left the divinity-hall of king's college, Aberdeen, which he had attended three months, when he commenced an itinerant preacher. In this situation he grew more and more dissatisfied with the doctrine and discipline of the church of Scotland. He therefore left the old way, and struck out into a new path, to which he imagines the scriptures of the New Testa-

ment directed him. He has advanced some plausible objections against the practices of the church from which he has withdrawn; but if we have properly understood him, he has not been very successful in his endeavours to discover the apostolic doctrine and institutions. He has left an old way, and turned aside into a new one; there is an older way still, the good old way of Jesus and his apostles.

MISCELLANEOUS.

ART. LV.—*The first Report of the British and Foreign Bible Society, 1805, with an Appendix, and a List of Subscribers and Benefactors.* 8vo. pp. 108.

THIS society was formed in the year 1804, and we sincerely congratulate its benevolent members upon the rapid and extensive success which appears to attend their exertions. The object they have in view is in the highest degree important, and the prospect of its attainment is proportionably encouraging. The committee deserve the warmest praise for the zeal and industry with which they have communicated throughout Europe the institution of the society, and for the judgment with which they have promoted its design. An institution which solicits the concurrence of persons of every sect and party, may displease the bigot, but whilst it perseveres upon such broad and liberal principles, to give as wide a circulation as possible to the scriptures, in the most generally approved versions, without note

or comment, it will meet with the good wishes and the encouragement of every friend to religion and virtue.

The report now published is highly interesting. We learn from it, that in consequence of a notification of the plan of the society being sent to Germany and Switzerland, a similar establishment has been formed in the imperial city of Nuremberg, supported by contributions from various parts of those countries, and promising to be very extensively useful. There is reason also to hope that a bible society will be soon formed in the German dominions of the king of Prussia. The advantages of these institutions are likely to be extended even to the Roman catholics. In a letter from a priest of this communion, laid before the committee, it is stated:

"That all blind bigots of his church have always spread an opinion, that it was entirely forbidden to the common people to read the bible, and that this opinion is still too prevalent. That notwithstanding this, many of their clergy both in Swabia and Bavaria, not only recommend the reading of the scriptures, particularly of the New Testament, but strongly exert themselves to promote it. That he had himself distributed many new Testaments, and some Bibles, among the more enlightened catholics; that the people seem more and more desirous of perusing the bible, and that the number of clergymen disposed not only to tolerate but to commend it, is daily increasing."

The efforts of the society have been warmly seconded in Scotland and Wales: the deplorable ignorance of the lower classes in Ireland checks the exertions that would otherwise, no doubt, be also made in that country.

At the same that the committee endeavoured to make this institution generally known, their enquiries were directed to ascertain to what extent the want of bibles existed in the christian world at large.

In the southern provinces of Ireland the want of bibles is particularly felt; not above a third part of the protestant families there possess bibles, and amongst the papists, who are far more numerous, a bible is probably not to be found in more than one out of five hundred families. In Sweden and in Holland the inhabitants are well supplied; to the enquiries which have been made with respect to Denmark and the Russian empire, no answer has been returned.

A design of printing copies from a Chinese MS. of the New Testament, has been relinquished, chiefly owing to the expence it would occasion, no less than six thousand pounds being required for the printing of five thousand copies. Two thousand copies of a translation of the gospel of St. John in the Mohawk language have been printed, five hundred of which have been recently sent to America. We cannot consider this as a judicious measure. Had it been the gospel by Matthew or Luke, some good end might have been answered; but a supplementary work, in no small degree obscure, not fully understood by our own divines, will hardly make a favourable or durable impression upon the minds of Indians.

The correspondence granted to the report is in the highest degree interesting. Mr. Kiesel, a respectable merchant

in Nurenberg, thus writes to the society:

"When sometimes I am privileged to give away a bible or New Testament, father and mother, son and daughter, are running after me, thanking me a hundred, and a thousand times, kissing my hand, and my coat; shedding tears of joy, and loudly exclaiming; 'May God bless you: may the Lord Jesus bless you in time and to all eternity.' Really I felt sometimes a foretaste of heavenly joy, so that I could not sufficiently bless God, for having entrusted me with the honourable commission of steward of the kind benefactions of others. But the more I disperse, the more the petitions both of ministers and school-masters increase, not only from Austria, but likewise from Stiria, Carinthia, and Hungary, insomuch that I am afraid to present their petitions."

A letter from a clergyman in Alsace contains the following curious and interesting passage:

"The first bible shall be given as a present to Sophia Bernard, who is one of the most excellent women I know, and indeed, an ornament to my parish. While unmarried, she undertook, with the consent of her parents, the support and education of three helpless boys, whom their wicked father had often trampled under his feet, and treated in a manner too shocking to relate, when nearly starving with hunger they dared to cry out for food. Soon afterwards, she proved the happy means of saving the lives of four Roman catholic children, who, without her assistance, would have fallen a prey to want and famine. Then she had the management of seven children, to whom several more were added, belonging to members of three several denominations; she now hired a house and a servant girl, and supported the whole of the family entirely with her own work, and the little money she got from the industry of the children, whom she taught to spin cotton. At the same time, she proved the greatest blessing to the whole village where she lived. For it is impossible to be more industrious, frugal, clean, cheerful, edifying by her whole walk and conversation; more ready for every good word and work; more mild and affectionate, more firm and resolute in dangers, than she was: Satan so enraged some of her enemies, that they threatened to destroy her old tottering cottage, but God was graciously pleased to preserve her. A fine youth, of a noble mind, made her an offer of his hand. She first refused, but he declared he would wait for her even ten years. When she replied, that she could never consent to part her poor orphans, he nobly answered, 'Whoever takes the mother, takes the children too.' So he did; and all these children were brought up by them in the most careful and excellent manner. Lately, they have taken in some other orphans, whom they are training up in the

fear and love of God. Though these excellent people pass rather for rich, yet their income is so limited, and their benevolence so extensive, that sometimes they hardly know how to furnish a new suit of necessary clothes. To them I intend to give a bible, considering that their own is very often lent out in different Roman catholic villages."

Nor much less interesting is the information which has been received from a clergyman in North Wales:

"There are none of our poor people willing to live and die without contributing their mites towards forwarding so glorious a design. Their zeal and eagerness in the good cause, surpasses every thing I have ever before witnessed."

"On several occasions we have been obliged to check their liberality, and take half that they offered, and what we thought they

ought to give. In very many instances, servants have given one-third of their wages for the year."

"In one instance, a poor servant-maid put down one guinea on the plate, being one-third of her wages: that it might not be perceived what she put down, she covered the guinea with a halfpenny. One little boy had, with much trouble, reared a brood of chickens; when the collection came to be made, he sold them all, and gave every farthing he got for them towards it; and this was his whole stock, and all the living that he had. Innumerable instances of a similar nature might be mentioned."

We are happy to find that this truly excellent institution meets with so much encouragement; and we hope and believe "that its beneficial effects will be progressive and permanent."

ART. LVI.—*Letters of St. Paul the Apostle, written before and after his Conversion. Translated from the German of the late Reverend John Casper Lavater, Minister of the Gospel at Zurich.* 8vo. pp. 115.

NO weak evidence in proof of the genuineness and authenticity of the books of the New Testament, has arisen from the perfect consistency that appears between the character of the apostles and the writings attributed to them; and if the validity of that evidence required to be demonstrated, an appeal might be safely made to the publication now before us. For any other purpose it is altogether useless. It affords a complete demonstration of the inability of genius to contrive such a forgery as the apostolic epistles would be, had they not been composed by those persons whose names they bear. The character of the apostle of the Gentiles, is in these letters most grossly violated; feelings are attributed to him, which it is evident from his history he never knew; and opinions are here delivered as his, to which he was a total stranger; opinions indeed which were not known in the christian world, till many years after his death had elapsed.

It is hardly worth our while to observe, that these letters are arranged in four parts. 1. Letters to various persons, who agreed with Saul, or differed from him in respect to Jesus and his disciples. These are six in number: to Gamaliel, to Caiaphas, to Simeon, to Eleazer, to Jacob Ben Israel, and to Judas of Damascus. 2. Four letters written immediately after his conversion; to Simeon, to Joseph and Sunma, the two witnesses against Stephen, to Gamaliel, and to Ananias. 3. Nine letters to his christian friends, Titus, Timothy, Apollos, Erastus, Aquila and Priscilla, Lydia, Sergius Paulus, Epaphroditus and Luke. 4. Letters to instruct, warn, reprove, and direct persons in error, and backsliders.

Were it possible for any one of the persons here addressed to peruse the epistle inscribed to him, he would assuredly exclaim with Felix, Paul thou art beside thyself!

ART. LVII.—*On Earth Peace, Good Will towards Men; or, the Civil, Political, and Religious means of Establishing the Kingdom of God on Earth, as fully contained and confirmed in the Scripture Prophecies; in which will be comprised, the proper practical Measures of redressing public Affairs, uniting all Parties, and bestowing permanent Peace, Prosperity, and Happiness, on Great Britain, and all Nations. By the Author of the Income or Property Tax.* 8vo. pp. 500.

THE language of this work announces well-inclined benevolent man, much read in the theologians and politicians of the day, who has intertwined into a sort of system the expectations of millenarians and perfectionists, and believes his book to be the predestined harbinger of purified

religion and perpetual peace. Happier who can so dream, than he who estimates more justly the phenomena of reality.

We do not think the work likely to contribute essentially to the rapid progress of the whole toward perfection. It is diffuse, and it is driftless. No precise

counsels are given how to amend the condition of mankind. We are taught to expect this amelioration from Daniel and the Apocalypse; which is calling on Hercules, instead of applying our shoulders to the wheel. The moral tendencies of the human mind are classed; but no discoveries are made in the method of abolishing the selfish, and diffusing the philanthropic affections. The author boasts, (page 469) that he invented the income-tax! let him complain, and welcome, that he is unrewarded by the minister; but let him not claim the gratitude of the people.

With a general complacency in the tendency of this work, we are much at a loss for specific grounds of approbation. A vague metaphysical pious verbiage overflows, like the silver mists of moon-light, every thing definite in the author's prospects. His new Jerusalem is a city in the clouds, to rise like an exhalation, one sees not how, to glisten like a boreal aurora, one knows not whence. Rulers are to govern as if they were christians, subjects are to earn money only to give alms; and war and want are to melt away.

This author's manner is desultory; he immingles dissertations on the philosophy of mind with his religious projects and his political dogmatism: a convenient specimen to detach is the following confused dissertation on the faculty of intellectual combination, which seems written for no other purpose than to display the want of it.

"As this important faculty consists or operates in joining, uniting, connecting, and placing together various things, notions, ideas, thoughts, acts, facts, truths, &c., of different kinds, so as to form from them new or other compounds, objects, subjects, &c.; for instance, a notion, a complex idea, a song, an oration, a picture, imagery of various sorts, &c.; and as it may thus be considered as the creative faculty of the mind, for which we want a proper name, those of imagination and invention being exceptionable in some respects.

"As expression is a principal adjunct, or of material consequence in all those kinds of compounds, works, &c. of the intellectual combination, wherein language, painting, &c. are employed as mediums to communicate them, and become farther important for the purposes of rendering them more pleasing, instructive, and entertaining, as well as more powerful and extensive, in the effects they produce: as therefore those combinations in which language, painting, &c. are such essential ingredients, may be called compositions, which term will happily and conveniently dis-

criminate them from those wherein language, &c. are less material, or dispensable.

"As the different kinds of intellectual combination may, conformably to this distinction, be arranged under the following heads:—

Ordinary intellectual combination,
Original intellectual combination,
Ordinary composition,
Original composition,
Imaginative composition,
Original imaginative composition,
Wit,
Association.

"As ordinary intellectual combination is employed in putting our acts, thoughts, &c. together, in order to execute various performances, express our sentiments, &c. according to modes common to all men in respect of different incidents, and for the various purposes of human life: as it is, in an indefinite point of view, of important service in joining different ideas and notions into others more complex, and giving these proper names whereby they may be fixed in future, generally known, and more readily recalled: or in farther enlarging them by a similar junction, as the advantages of science or the improvement of society may require; or in alienating, modifying, and subtracting from them, as may be requisite: as general notions and theories, which are of the greatest advantage in life, are naturally formed by the mind in various processes: this faculty combining abstract ideas, &c. together for the purpose, the preceding forming methodical arrangements, which comprehend the different particulars brought under them, and the thorough conception of one individual of the same species agreeing in general with that of all of them except in a few circumstances, which however the mind soon learns to lay aside.

"As original intellectual combination has been of singular service in forming very valuable compound notions and ideas; for instance, in respect of numbers, the compound notion of which, as hundreds, thousands, millions, &c. enable us to form satisfactory conceptions of the largest amount of individuals: as it has been still more serviceable or meritorious in various views, projects, and actions, which it has concerted and carried into effect, of superior excellence to such as were common before: as it is thus from the greater strength and extent of its powers above those of the others entitled to the rank and distinction of genius. For literature is incompetent to form this, and could not elevate Cæsar above Alexander the Great, as a consummate general; and though it is an object highly desirable, that genius should not only perform, but by language transmit to posterity the noblest services, and the most finished monuments of taste, yet it is probably here deficient, only because it has neglected, or has not had the opportunity of acquiring literary talents.

"As it appears unnecessary, and even improper, to speak at large of the nature and process of plain literary composition, whether

ordinary or original: for what may here be said in respect of combination and expression, or of the requisites of either, is too well understood and generally known to require any explanation; and there is no want of excellent examples of both.

"As imaginative composition corresponds in general with these last remarks: as it often borrows its combinations or descriptions from nature, yet displays them with just selection and discrimination, as well as with great elegance and talent: as imaginative composition, and original imaginative composition, are characterised from their ability to gratify our taste and feelings according to the system and principles, the heads of which are given in the end of the second subdivision of the mind: as they both affect and captivate, elevate and astonish, delight and gladden mankind with their powerful and diversified performances, but require for this purpose all the advantages, graces, and charms of nature, fancy, and expression: as imaginative composition has often been confounded with the mere recollection of its own imagery, or of pleasing conceptions, notions, or ideas in art or nature: as excellency of original imaginative composition is often considered as the highest effort of human ability; and as the most serious subjects of plain literary composition demand their assistance in some degree, in order to acquire suitable charms and perfection.

"As the excellency of original combination in general, if it be occasionally the gift of nature, can often be formed or created by different means: and as it is greatly dependent on various external circumstances, and on the happy and proper employment of the powers of the mind in general; on the quantity and nature of the information or materials gathered and combined; on temper and character; on the predominance of certain passions, particularly of those which excite, elevate, and inspire the mind and fix its attention; on the intellectual faculties; on these being fully and variously exercised, particularly in the different modes of combination; on their penetration, and the manner in which they observe things; on their comprehensive views of the largest and most minute objects; on memory and recollection, and on their being stored with objects applicable to the purposes pursued; on surrounding scenes and situations, as favourable to the progress of peculiar thoughts; and on the mind not being restricted to present attainments, but daring to launch forth in a free manner in pursuit of such as are yet undiscovered or unemployed, and being

competent to convert them with propriety and advantage to its particular purposes.

"As wit itself is allied with imaginative and original composition, and may be benefited by the preceding observations: and as it consists or operates in forming a composition or picture, the unexpected and fanciful relations or analogies of which surprise, please, excite risibility, and constitute in a great measure its peculiar nature.

"As association may be considered to be a species of intellectual combination, by which we attach things intimately to each other, which yet are so different in nature, that they cannot unite and form a whole; we thus associating external objects, circumstances, and qualities together, thoughts with other thoughts, feelings with other feelings, thoughts and feelings together, and any of these with external objects, and often with little or no examination, and from the slightest relations: as thus various opinions, dictates of the passions, notions, and ideas, are improperly associated, but being respected by us, the things with which they are associated act upon us by their means, and thus appear different to us from what they actually are: as the motives of our actions are in like manner very subject to such associations, and under the impressions of these influence our conduct: as even the beauty and sublimity of material objects may in a great measure depend upon the ideas and feelings, which we have attached to them: and as the recurrence of a thought, or object, often causes us, to recollect its associations."

This whole passage, and many another such, has nothing to do with peace on earth, good will towards men, or the civil, political and religious means of establishing the kingdom of God on earth, which are the professed purposes of the writer. It exhibits an extraordinary want of memory. The phrases flow so quickly from the author's pen, that he forgets, over his explanatory amplifications, the purpose, the design, the end, the aim, the scope, the drift of his assertions; and each paragraph terminates without coming to any one proposition whatsoever. We have *as* again and again, but never arrive at the *so*. We are much afraid the writer's millennium, like his argument, will be always about to begin: and then the paulo-post-future of prophecy is in fact an aorist tense.

ART. LVIII.—*A few Thoughts on the Creation, Generation, Growth and Evolution of the Human Body and Soul: on the spiritual and immortal Nature of the Soul of Man: and on the Resurrection of his Body, at the last Day, in a spiritual, incorruptible, and glorified State.* 8vo. pp. 171.

"It will, no doubt," says the unknown author of this tract, "be granted, that in vain do the ministers of God preach to

men concerning the care and salvation of their immortal souls, while, according to the fashionable doctrines of the times,

they believe that they have no souls to be saved." *Introd. Rem. p. vi.*

From such an exordium what may not be expected? Among many other brilliant discoveries no one can be more acceptable than a complete answer to the enquiry which has been so often instituted concerning the seat of the soul:

"As, therefore, Adam was created alive, then breathed the same common air as did the other living creatures; so it is evident, that the inspiration of God into his nostrils, was not for the purposes of common animal breathing, but for the formation of his living soul. And is it not highly probable, that this inspiration was meant to pass into the brain, in the course of the olfactory nerves, to pervade its substance, and from thence to be diffused through the whole body?"

And again:

"That the soul's residence in the body is extended throughout the whole, appears to be further implied from the following circumstance: When the surgeon amputates a leg, the patient, often, afterwards complains of the toes of that foot, although they have, with the leg, been separated from the body; and this symptom has generally been accounted for, by saying that it arises from the irritation of

the extremities of those nerves, by which the nervous influence was conveyed to the toes. But it seems to me rather to intimate, that this sensation is conveyed from that part of the soul itself which formerly resided in the toes, and now exists in a new situation; for though the surgeon amputated a part of the body, he could not also divide a portion of the soul; as it most probably shrunk from his knife, and retired upwards."

Every other inquiry upon this important subject is decided with equal ingenuity and precision. Texts of scripture that have puzzled the ablest commentators, are here presented to the reader freed from every obscurity. Dr. Priestley is clearly convicted of ignorance of physiology as well as of the language of holy writ; and bishop Law is proved to have been a bungling interpreter. Nay, so confident is this advocate of immaterialism in the ability with which he has managed the cause, that he thinks he may venture to assert, that, if the excellent bishop of Carlisle was now alive, he would rejoice, yea, greatly rejoice, to see the subject placed in that clear point of view, in which it is now permitted to appear. *p. 157.*

ART. LIX.—*The Christian Mirror; exhibiting some of the Excellencies and Defects of the religious World. Containing various Essays in Prose and Verse.* 12mo. pp. 283.

THIS is not altogether an uninteresting collection of essays upon various religious and moral subjects. The principles which are inculcated are those usually deemed orthodox; the characters in-

troduced are supported with some degree of spirit; and the general tendency of the whole is to correct the errors and to improve the virtues of those who profess to entertain a reverent regard for religion.

ART. LX.—*A View of Religions, in three Parts: Part I. Containing an alphabetical Compendium of the Denominations among Christians. Part II. Containing a brief Account of Paganism, Mahomedism, Judaism, and Deism. Part III. Containing a View of the Religions of the different Nations of the World. By HANNAH ADAMS. A New Edition, with Corrections and Additions. To which is prefixed, an Essay on Truth. By ANDREW FULLER.* 12mo. pp. 300.

THIS will be found a very useful compilation by those who have not Broughton, Mosheim, and other works of a similar kind in their possession. The authorities seem in general to be well selected, and the leading principles of different sects are represented with fidelity and candour.

We transcribe as a specimen, the following account of the Greek church:

"GREEK CHURCH. In the eighth century there arose a difference between the eastern and western churches, which was carried on with great vehemence during the ninth century; and in the eleventh century a total separation took place. At that time the pa-

triarch Michael Cerularius, who was desirous to be freed from the papal authority, published an invective against the Latin church, and accused its members of maintaining various errors. Pope Leo the ninth retorted the charge, and sent legates from Rome to Constantinople. The Greek patriarch refused to see them; upon which they excommunicated him and his adherents publicly in the church of St. Sophia, A. D. 1054. The Greek patriarch excommunicated those legates, with all their adherents and followers, in a public council; and procured an order of the emperor for burning the act of excommunication which they had pronounced against the Greeks. This rupture has never been healed; and at this day a very considerable part of the world profess the religion of the Greek, &

eastern church.—The Nicene and Athanasian creeds are the symbols of faith in this church.

"The principal points which distinguish the Greek church from the Latin, are as follow:—1st, They maintain that the Holy Ghost proceeds from the Father only, and not from the Father and Son.—2d, They disown the authority of the pope, and deny that the church of Rome is the true catholic church.*—3d, They do not affect the character of infallibility.—4th, They utterly disallow works of supererogation, indulgences, and dispensations.—5th, They admit of prayers and services for the dead, as an ancient and pious custom; and even pray for the remission of their sins: but they will not allow the doctrine of purgatory,† or determine any thing dogmatically, concerning the state of departed souls.—6th, They sometimes defer the baptism of their children till they are three, four, five, or ten years of age.‡—7th, The chrism, or baptismal unction, immediately follows the immersion of baptism. The priest anoints the person baptized in the principal parts of the body, with an ointment consecrated with many curious circumstances for that purpose by a bishop: this chrism is called the unction with ointment. Extreme unction is called the consecration with holy oil. This chrism is a mystery peculiar to the Greek communion, and holds the place of confirmation in that of the Roman: it is styled *the seal of the gift of the Holy Ghost*.—8th, They insist that the sacrament of the Lord's supper ought to be administered in both kinds:¶ and they give the sacrament to children immediately after baptism.—9th, § They exclude confirmation and extreme unction out of the seven sacraments.—10th, They deny auricular confession to be a divine precept, and say it is only a positive institution of the church. Confession and absolution constitute this mystery|| in the Greek church, in which penance does not make a necessary part.—11th, They

do not pay any religious homage to the eucharist.—12th, They administer the communion to the laity both in sickness and health.—13th, They do not admit of images in bas-relief, or embossed work; but use painting and sculpture in silver.—14th, They permit their secular clergy to marry once; but never twice, unless they renounce their function, and become laymen.**—15th, They condemn all fourth marriages.

"The invocation of saints, and transubstantiation, are alike received by the Greek and Latin churches. They observe a number of holidays, and keep four fasts in the year more solemn than the rest; of which the fast in lent, before easter, is the chief.

"The service of the Greek church is too long and complicated to be particularly described in this work: the greatest part consists in psalms and hymns.—Five orders of priesthood belong to the Greek church; viz. bishops, priests, deacons, sub-deacons, and readers; which last includes singers, &c. The episcopal order is distinguished by the titles of metropolitan, archbishops and bishops. The head of the Greek church, the patriarch of Constantinople is elected by twelve bishops, who reside nearest that famous capital; but the right of confirming this election belongs only to the Turkish emperor. The power of this prelate is very extensive. He not only calls councils by his own authority to decide controversies and direct the affairs of the church, but, with the permission of the emperor, he administers justice, and takes cognizance of civil cases among the members of his communion. The other patriarchs are of Jerusalem, Antioch, and Alexandria, who are nominated by the patriarch of Constantinople. Besides the power of nominating the other three patriarchs, and all episcopal dignitaries, the patriarch of Constantinople enjoys a most extensive jurisdiction; comprising the churches of Anatolia, Greece, Wallachia,

* The eastern church attach no idea of personal sanctity or infallibility to the patriarch of Constantinople, their supreme head, although he bears the style of the thirteenth apostle.

† The Greeks, and all the eastern nations in general, are of opinion that departed souls will not be immediately and perfectly happy; but that the first paradise will be a state of repose, and the next of eternal felicity.

‡ This is the custom of the Georgians, who are a part of the Greek church. The Greeks perform baptism by dipping the person three times under water distinctly, in the name of the Father, Son, and Holy Ghost.

¶ The napkin which is spread upon the holy table must be consecrated by a bishop, and have some small particles of the relics of a martyr mixed in the web, without which the eucharist cannot be administered.

§ The last sacrament of the Greek church, is that of the holy oil, or *euchalaion*, which is not confined to persons in the last extremity, like the extreme unction of the Roman church; but is administered, if required, to devout persons upon the slightest malady. Seven priests are required to administer this sacrament regularly, and it cannot be administered at all by less than three. After the oil is solemnly consecrated, each priest, in his turn, anoints the sick person, and prays for his recovery.

|| Sacraments are called mysteries in the Greek church. By the Greeks, a mystery is defined to be a ceremony, or act, appointed by God, in which he giveth, or signifieth his grace; and of the seven which they celebrate, four are to be received by all christians; viz. baptism, the baptismal unction, the eucharist, and confession. None of the other are considered as obligatory upon all. See Supplement to the Encyclopadia, vol. i. p. 487.

** Their regular, or monastic clergy, are never allowed to marry.

Moldavia, and the islands of the Archipelago.—For the administration of ecclesiastical affairs, a synod, convened monthly, is composed of the heads of the church resident in Constantinople. In this assembly the patriarch of Constantinople presides with those of Antioch and Jerusalem, and twelve archbishops.

In regard to discipline and worship, the Greek church has the same division of the clergy into regular and secular, the same spiritual jurisdiction of bishops and their officials, the same distinction of ranks and offices with the church of Rome.

"There is a branch of the Greek church that, though joined in communion of doctrine and worship with the patriarch of Constantinople, refuse to receive his legates, or to obey his edicts. This division is governed by its own laws and institutions, under the jurisdiction of spiritual rulers, who are independent on all foreign authority.

"The Greek church comprehends in its bosom a considerable part of Greece, the

Grecian isles, Wallachia, Moldavia, Egypt, Abyssinia, Nubia, Lydia, Arabia, Mesopotamia, Syria, Silicia, and Palestine; Alexandria, Antioch, and Jerusalem; the whole of the Russian empire in Europe; great part of Siberia in Asia; Astracan, Casan, and Georgia.

"It is asserted by Dallaway, in his account of Constantinople, ancient and modern, which was published in 1797, that all orders of the Greek clergy inferior to bishops are permitted to marry. Celibacy and the assumption of monastic habits, are indispensably requisite in those who are candidates for the mitre.

"The riches of some of the Greek churches and monasteries, in jewels, particularly pearls, in plate, and in the habits of the clergy, are very great, and reckoned not much inferior to those in Roman Catholic countries."

The least valuable part of the work is the inconclusive and illiberal essay on truth which is prefixed by the English editor.

CHAPTER III.

HISTORY, POLITICS,

AND

STATISTICS.

IF we estimate the value of an historian by the research which he displays, the highest place among the writers whose works we are about to notice, is unquestionably due to Mr. S. Turner: his former volumes on the History of the Anglo-Saxons, have already received from us their merited praise; and his concluding volume on their Manners and Literature, possesses the same solid merits, and will prove more acceptable from its subject to the general reader. Mr. Belsham has also concluded his well-written and spirited though prejudiced History of the Present eventful Reign. Capt. Rainsford has communicated some new and curious information concerning the recently established Negro Empire of Haiti; and the Historical Fragments of the Mogul Empire, collected by the late Mr. Orme, will bestow upon him an additional claim to the respectful remembrance of his countrymen.

The spirit of political controversy has been unusually quiet during the last year: the Catholic Petition, indeed, has stimulated the angry spirits of a few obscure politicians, to repeat some old and often refuted calumnies, but the general good sense of the nation appears satisfied, that not merely a nominal but a real union and co-operation of all the subjects of the realm is absolutely necessary to the independence and political existence of Britain.

It is curious to observe, notwithstanding the notorious and systematic discouragement to literature which has distinguished the administration of this country for the last twenty years, that the influence of the reading and writing part of the public has been silently but rapidly increasing; in consequence of which the candidates for literary fame, among the higher ranks of society, have been of late more numerous, and we may add (without disrespect to the noble and royal names in Walpole's catalogue), more meritorious than formerly. A new direction also appears to have been given to their studies: the desire of writing indifferent verses has been replaced by the more honourable ambition of excelling in those studies, connected with national and general politics, which are strictly professional to every British nobleman, and to every member of the House of Commons. Hence we have to rank among the foremost names in our present Chapter, the Earl of Selkirk, for his enquiry into the state of the Highlands; the Earl of Liverpool for his letter to the King concerning the Coins of the Realm; the Earl of Lauderdale

for his work on the state of the Circulation; Sir J. Sinclair for his History of the Revenue; and Mr. Rose for his enquiry into the Poor-laws.

The new principle of maritime law lately put in practice against the Americans, has met with a specious anonymous advocate. The national defence and state of our military forces have been treated of by two or three writers, and the rising commerce of the Black Sea has given occasion to some interesting and practical information in a pamphlet on the subject.

ART. I.—*The History of Egypt, from the earliest Accounts of that Country till the Expulsion of the French from Alexandria in the Year 1801.* By JAMES WILSON, D.D. 3 Vols. 8vo.

THESE three volumes are dedicated to the son of sir Ralph Abercromby, and may be considered as a result of that interest, which, since his achievement, the British public has taken in Egypt.

The history of distant ill-known countries ought always to begin with a geographical sketch of those permanent features of the land, water, and air, which influence the distribution, the movements, and the manners of the inhabitants; because whatever peculiarities of the present dwellers necessarily result from their situation, may confidently be ascribed to the antient ones, although not specifically recorded of them. Mr. Wilson has with propriety consecrated his first chapter to the geography of Egypt. We should have preferred a description more entire of the features of nature from Bruce and Brown, and of the monuments of art from Pocock. We are sorry at observing references to Bryant; this looks as if his dreams were trusted.

The second chapter treats of the manners of the early Egyptians. Closely connected with these phenomena is the investigation of their origin. Volney, from personal observation, and Monboddo, from ancient authority, have thought that the progenitors of the Copts were negroes. Mr. Browne does not perceive, in these Copts, the African physiognomy, but rather the Arabian; and denies to them the snub nose and the woolly hair. There are other clues of investigation which may be called in aid. A close resemblance has been observed between the Hindoo and the Egyptian superstitions: the names of several divinities agree; the veneration for the cow, and for the lotos, as an emblem of production, prevail among both; their zodiacal signs are alike, and are of a nature to have been invented in India; both nations were divided into castes; both had underground temples, an arcane theology for the educated, and a gaudy idolatry for the multitude. It is

likely, therefore, that the Egyptians are from one stock with the Hindoos. The Hindoos are from Tibet; for it is clear that they flourished in the Penjab, and adown the Indus, or Sind, as well as adown the Ganges: and it is also clear that a people, having many of the radical rites and manners of the Hindoos, must have descended the yellow river, and have formed the basis of Chinese population. A situation about Tibet for the progenitors of the Hindoos solves all the phenomena. But how could these people get to Egypt? The most probable answer is this; coastwise, from river's mouth to river's mouth. Colonies spread in the antient world, as in the modern. Those who inhabited the Delta of the Indus, would, in their coasting voyages, discover the Delta of the Euphrates. The merchants of Patala, Minnagora, and Barigaza, would found a Babylon; and attempt there the same interchange of finger-work for food, of manufactured for raw material, which our merchants began successively at the mouths of the American rivers. The Delta of the Sind, or Indus, has incurred desertion, probably from natural causes; perhaps from some very great flood, of which the early settlers at Babylon and in its vicinity seem to have preserved a strong recollection.

From the Jewish or Babylonian scriptures it appears, that this same people had already in the time of Solomon, founded sea-ports, or emporiums, in both the forks of the Red Sea, at Ezion-geber, and at Eloth, or Suez. From this last place the colonization of Egypt is a mere step; and it seems to have begun about Cairo, or Kahira, as a town called Babylon, after the old country, existed in that neighbourhood in the time of Cambyzes. Tyre branched from Ezion-geber, as well as the first seats of Egyptian commerce. Memphis, signifying *mouth*, was, when first founded, on the Mediterranean: the Delta is subsequent accretion.

This order of filiation being admitted, the Copts, or ancient Egyptians, must be referred to the Asiatic Blacks, to the same human race as the Lascars, and not to the African breed. But although the inhabitants of Memphis and Cairo, and the commercial population of the Delta, may with great confidence, be derived from an oriental source, it is not equally clear that No-ammon in Upper Egypt, the Diospolis or Thebes of the Greeks, was a colony from the same quarter. Its population may have ascended the Nile; but there is not proof so strong: a resemblance of language however is stated to prevail between Upper Egypt and Abyssinia, and the language of Abyssinia is said to resemble that of Syria and Arabia: so that an oriental and not an African origin may most rationally be assigned to the whole Egyptian nation, and indeed to the mass of settlers on the African coast of the Red Sea. Pyramids seem to have been contrived for places of refuge during inundation: the numerous or lower classes were naturally arranged on the wide steps; the priests, the nobles, and the kings, on the narrower summits of the structure; and thus each order of the people was secure, during the public danger, in proportion to its rank in the social pyramid. The tower of Babel, according to the description of Herodotus, must have been a pyramid of this kind, consisting of seven mounds, or steps. The rage for these anti-diluvian structures would be peculiarly natural in a people, compelled by inundations to emigrate from the Delta of the Sind. It may be inferred, from the description of the ark of Noah, that the navigation of these early merchants and fugitives, was conducted in ships of wicker.

What the Greeks called the aversion of the Egyptians for strangers, seems to have been nothing more than the enactment and execution of some quarantine precautions: for the fact of a ready intercourse with Persians, Jews, and Greeks, at all periods of their history is notorious: and the Greeks had a landing-place, or as we should call it a lazaretto, assigned to them at Naucratis, on their complaining of these restraints.

In the second book Mr. Wilson begins the history. The first chapter talks of Menes, Osymandias, Sesostris, and Phoron. It is wise to say little about them. All nations were originally governed by judges, or village-caciques, each of whom was sovereign in his own establishment,

or district. Beside these local, hereditary, patriarchal, petty, sovereigns, who are often called kings by the historians of early times, another class of powerful chieftains existed, elective generals of the fighting population, a sort of leaders of banditti, whose trade, like that of the Arabs, was plunder, and who occasionally collected for some specific inroad a considerable army: these military chieftains are also called kings. Of this last kind was Sesostris; but the relations concerning him are too extravagant to merit more than a qualified confidence.

Mr. Wilson relies too much on Diodorus Siculus, a compiler of Greek romance, who flourished under Augustus: it was the story of Herodotus that should have been told, if it was not to be sifted, as having some claim to the rank of early and original testimony; but Herodotus himself may safely be corrected by the book of Joshua.

In mentioning the Sethos of Herodotus, Mr. Wilson might more confidently have attributed to him an identity with the king Hezekiah of the Jews. Among the Greeks, the Jews passed, like their Chaldean and Persian progenitors, for fire-worshippers; and hence it happens that Hezekiah is called a priest of Vulcan. We may know the fire-worship to have been at most emblematic, or rather ritual; but the idolatrous by-stander, seeing no image, supposed the worship addressed to the flame on the altar. Michaelis assents entirely to the identity of Sethos and Hezekiah. The deliverance of Hezekiah from Sennacherib must have been recorded in hieroglyphic characters, whence Herodotus inferred a deliverance by mice. He says mice gnawed the bowstrings of the Assyrians, and thus compelled their retreat. But we know from the hieroglyphics of Horapollo (No. 50) that the mouse was the symbol of disappearance, and from 2nd Chronicles (xxxii. 21.) that the disappearance resulted from an epidemic malady, by which armies have often been thinned; yet there are hints which may infuse the suspicion that this disappearance was partly accomplished by the payment of a contribution out of the temple-treasury.

Psammeticus was the true founder of kingship, of an hereditary dynasty of sovereigns, among the Egyptians: his brother-judges lifted him into power, and thus his authority partook the stationary character of theirs, and comprized twelve hitherto independent pharaohships. The

defeat of the Scythians in Palestine, celebrated in the xxxviiith and xxxixth chapters of Ezekiel, is perhaps to be dated under Psammeticus.

To him succeeded Necho, the enemy of Josiah; he was a sovereign of merit, and patronized voyages of discovery; his ships are said to have girdled Africa. Psammis, Hophra, and Amasis succeed. References to authorities are in this part of the work very scarce; and the chronological difficulties in reconciling the Babylonian and Egyptian series of kings are eluded by silence, not met, not conquered.

With the third book begins what may be called settled history. It extends from the accession of Cambyses upon the Chaldean throne, until the death of Alexander, and the consequent partition of his conquests among the generals of his army.

The fourth book condenses the history of the Ptolemaic dynasty: they were the Medici of the antient world: literary without talent, opulent without virtue, perfidious and profligate, but munificent and sociable, both the families presided in the seats of refinement, during an age of culture, over a commercial and luxurious people, which ascribed to their patronage the wealth, the wit, and the art of Alexandria and of Florence. The literary history of the Alexandrian school of poetry and philosophy ought to have been given with more extent and elaboration: on these periods of bloom the historian should be careful to bid the reader's eye repose.

The fifth book gives the civil history of Egypt while it continued a Roman province; and the sixth book the literary and ecclesiastical history of the same period: here was an opportunity to use some recent discoveries of the German theologians.

The seventh book details the state of Egypt under the Omniad, the Abbassid and the Fatimite caliphs. The eighth narrates that celebrated crusade in which Richard Lion-heart acquired so high a reputation for personal prowess. This portion of the narrative may serve to give an idea of the historian.

"The kings of England had but lately appeared on the great theatre of conquest and fame, whereas those of France, from their situation and circumstances, had been more known and celebrated in war. Philip Augustus was one of the greatest princes who had appeared since Charlemagne; and therefore he entered the camp of St. John d'Acre with many prejudices in his favour; but the address

and courage of Richard, king of England, struck the whole armies with surprise; and in the sight of the Saracen, as well as the christian warriors, Philip of France was cast into the shade.

"Scarcely was the capitulation of Acca settled, when the French king made known his intention of returning home. Many might have been the reasons which produced this sudden determination, and some of them are ascribed to bad health, and danger from poison; but the principal causes seem to have been, disgust at the celebrity of his rival, and unjustifiable designs of aggrandizing himself at home, in Richard's absence. If honour, nay, if vows could have bound him, he must have pursued a different course; but he left Syria, and his departure was disgraceful. To injure the character of Richard, and, if possible, to veil his own perfidy, Philip falsely accused the king of England of hiring ruffians to murder Conrad. But the truth is, that the prince of Tyre had given offence to the old man of the mountain, and, having refused redress, that revengeful chief sent assassins, who cruelly put him to death.

"The origin, name, and conduct, of the tribe of assassins are thus recorded: Hassan Sabah was a Persian of science, and travelled much in pursuit of knowledge. He began to establish a new religious sect; and, in the career of his ambition, founded a dynasty. He made conquests of considerable importance, and took up his residence in the castle of Rudbar; but afterwards removed to Almut, which was a place of greater strength. His followers were taught the most absolute submission to their chief; and if they did his will, they were promised the most delightful abodes in Paradise. The chief of that people became terrible among the nations; for wherever he received an offence, real or imaginary, thither his servants secretly found access; and neither sovereign nor subject was secure from vengeance. They carried a concealed dagger, and, in the least suspected situation, stabbed, and put to death, the objects of their resentment. It was in this manner, and by such means, that Conrad suffered death.

"The prince of this tribe was called in Arabic Sheik al Gebal, that is the senior of the mountain; for the part of the Persian Irac, over which he presided, was the most elevated district of the country. His title, therefore, was the senior of the mountain; but the historians of the crusade, translating the word Sheik literally, denominated him the old man, instead of the prince or lord of the mountain. The assassins entertained some fanatical and dangerous notions about religion; and though they were occasionally weakened, yet they continued to infest the eastern world, till, in the year 1172, they were finally destroyed by Bibars, the sultan of Egypt. They were called assassins by the writers of the west, either from Hassan their founder, or from the name of their concealed

poniard, and hence secret and determined murderers are denominated assassins.

"While the king of France was pursuing unfriendly measures at home, Richard was warmly engaged in arranging the affairs of the Holy land. Philip, with a show of zeal for the interests of the crusade, left in Palestine, the duke of Burgundy, with 10,000 men. Richard, with the troops which were at his command, laid siege to Ashkelon, took the city, and added other towns and possessions to the remaining fragments of the kingdom of Jerusalem. It was sufficiently evident, that these successful efforts were intended, as preliminary measures, for making a grand attack upon the city of Jerusalem. When Saladin was compelled to leave Ashkelon, he hastened to the Holy city; and the king of England, having paused during the months of winter, followed him to Jerusalem. The approach of Richard spread consternation through the city; and it required all the influence and address of the Egyptian sultan to prevent the citizens from delivering the keys to Richard Plantagenet.

"Still, however, Saladin's prospect of success brightened; and when the hour of surrender appeared to have arrived, suddenly the king of England's army stopped, and the pursuit of victory was abandoned. The number of his soldiers had indeed been diminished by the fatigues and calamities of war, and there was a general desire of returning home. These occurrences were marked, and eagerly aggravated by the duke of Burgundy, who, like his master, the king of France, was jealous of Richard, and desirous of bringing him into disgrace.

"But whatever was the cause of deserting Jerusalem at the moment it might have been taken, we may presume that the fault was not in the king of England, and that it did not accord with any wish or desire of his, though the enemies of Richard have painted it in different colours. He heard the resolution with astonishment; he saw their retreat with affliction; he pled and threatened, but his prayers and threats were in vain. His laurels began to wither on his brow, and in agony he ascended a hill in sight of Jerusalem, to take his last look of the Holy city. But so completely was he overwhelmed with grief and shame, that he wrapt his face in his garment, in order that he might not behold the hill of Calvary, which he could not deliver from the power of the Turks.

"But in his retreat Richard was still formidable. His courage was terrible to his enemies; and in token of martial prowess, he was surnamed *Cœur de Lion*. With considerable advantage he finished a truce with Saladin, for the space of three years and upwards. Ashkelon and Ramla were to be dismantled; Tripoli and Antioch were to be respected by the Turks; and the whole sea-coast, from Jaffa to Tyre, was to be possessed by the Christians. The pilgrims of Europe were to be under the protection of Saladin, and to en-

joy every comfort, as if Jerusalem had not been taken. Saladin and Richard were struck with each other's greatness; and the historians of either party have done ample justice to the conduct of the heroes. The advantageous terms which Richard procured in a season of desertion and departure, are sufficient proofs of his wisdom and greatness. There was one proposal, however, in the terms of agreement, which may imply a greater regard to family aggrandisement, than to the general cause of the crusades. A marriage was suggested between Al Adel, a brother of the sultan of Egypt, and the queen dowager of Sicily, who was sister to the king of England. Though Richard may be charged with undue attention to the interests of his own family, yet an ingenious advocate might plead successfully in his behalf, and shew, that private interest was in that respect the public good.

"The conduct of Richard's troops would not allow him to persist in the attack upon Jerusalem; and, if the venerable city could not be taken by force, it was promoting the comfort of the christian pilgrims to have it placed under the direction of those who would yield them protection. It was stipulated, in the proposal of marriage, that Al Adel should be proclaimed king of Jerusalem, and St. John d'Acre was to be given in dower with the sister of Richard. Hopes might be entertained, that Al Adel, through the influence of a christian wife, might be persuaded to embrace the christian cause, or at least, in case of progeny, that the heir to the kingdom might prefer and adopt the sentiments of his mother. But the difference of religious opinions, and national manners, were unfriendly to the compact; and after mature deliberation the marriage proposal was mutually rejected. But the treaty in all its other parts was brought to a conclusion, and sanctioned with every usual solemnity.

"Richard, on his way to England, met with many difficulties, and was taken prisoner by the sinister conduct of his enemies; but he was soon set at liberty by the interposition of his subjects, and the influence of the pope. He was received at home with great demonstrations of joy; and was the first king, of the Norman race, who displayed much attachment to England, or was much beloved by his English subjects. After escaping many dangers in Syria and Palestine, he died upon the 6th of April, A. D. 1199, of a wound, which he received from an arrow in besieging the castle of a refractory vassal.

"The departure of Richard having delivered Saladin from the intrusions of a formidable enemy, he put the affairs of state in order, and returned to his favourite residence at Damascus. His health had been much impaired by the toils of a military life; and he had suffered greatly by the uncommon resistance which was necessarily required in opposing the crusades. He was seized with a loss of appetite, his spirits sunk; and at the age of little more than fifty-five years, he finished a

life of labour and success. He had reigned about twenty-four years over Egypt, and almost nineteen over Syria.

"A. D. 1193. The mourning, which was universal throughout the realm, sunk deeper than the exterior trappings of woe. He was a great, a generous, and a virtuous prince. By address, courage, and wisdom, he rose from an humble station, to the exalted rank in which he died. Ambition was the leading tendency of his character; and so eagerly did he strive for power and conquest, that though he owed every thing to Nouredin, yet he was guilty of ingratitude. The character of the times in which he lived, and the nature of his pursuits, did not permit him to be altogether free from violence; but, in general, he was a just and benevolent prince. He did not oppress his subjects; and though, in that unsettled state of society, he might have fleeced the rich, and harassed the poor, yet he often remitted the tribute which was due. He was illustrious in works of public charity, and encouraged every valuable pursuit. He was a devout Muselman, and punctually performed the various services which his religion enjoined. He set a high value upon the Sonnite traditions, and was rather gloomy and superstitious in his views."

The ninth book sketches in too concise and rapid a manner the fortunes of Egypt under the Ottoman dynasty. Mignet is the authority most habitually relied on: the abridgement of the Ottoman history by Digeon has the merit of being derived wholly from oriental sources, and might have supplied several particulars toward filling the interstices of this chronicle. The ninth book ought to have consisted of the first chapter only: as the second begins a wholly new subject, and treats of Egypt, since it has been dragged by the French into the list of territories to be contended for by the Europeans.

A tenth and concluding book, undertakes a delineation of the present state of Egypt. In discussing the object of Leib-

nitz's memoir (Vol. ii. p. 306.) we have given our opinion of the statistical value of the country: we value it lower than this author; and we wish that the peacemongers of Amiens had consented to evacuate it in favour of the French; if thereby a recognized possession of some equivalent African territory, as from the Cape to the Zaire, or from the Gambia to the Senegal, could have been obtained for this country. There is in the climate and conformation of Egypt an overruling force which condemns it, like Arabia, to a stationary condition: the French will not be able to render it important: it is in the main what it was of old. That stage of civilization which excited the wonder of the primeval savages of Greece is now barbarism: that degree of wealth which excited the cupidity of Roman armies and pro-consuls is now mediocrity.

This work is composed in a clear, agreeable, and lively manner, with too current a pen to allow careful investigation, and with too eager an expectation of the concluding campaign to allow all the requisite details: yet there are few writers who could have executed quick work so well, or good work so quick. We wish that the author would consider this as the sketch, the outline, the promise of a future more learned and more elaborate history of Egypt; and that in the progress of his enquiries he would allot more attention to the modern annals, which occupy less than their fair proportion of the whole composition. The talents, the acquirements, and the taste of Mr. Wilson are worthy to produce a more lasting monument: are worthy to attain a more courageous tone of criticism.

A map of ancient as well as of modern Egypt would have been convenient to the reader.

ART. II.—*History of Great Britain, from the Revolution, 1688, to the Conclusion of the Treaty of Amiens, 1802.* By WILLIAM BELSHAM. Vols. XI. and XII. 8vo.

THE task of a contemporary historian is peculiarly difficult: much trustworthy information always remains inaccessible during the life of the concerned: much known truth is veiled or varnished from motives of fear or hope. 'Tiberii Caique, et Claudii ac Neronis res, florentibus ipsis, ob metum falsæ; postquam occiderant, recentibus odiis, compositæ sunt.' A high degree of merit ought to be ascribed therefore to the mere courage of sincerity; it is of all qualities the scarcest, and of all

qualities the most important, in the witness of the transactions he has to record. This merit belongs to Mr. Belsham beyond his competitors.

One critic of Mr. Belsham's history has received a pension for disputing his account of the origin of the antijacobin war. When denial is recompensed so high, some impression must have been felt from the assertion. Yet we cannot but admit that for research Mr. Belsham has not merited so much praise as for freedom; and that

many sources of intelligence, especially the foreign, have been left unexamined with a negligence not entirely creditable to his industry or to his acquirements.

Mr. Belsham has the virtue, as Pausanias would call it, of writing with a plain style. 'Liceat denique hic addere (says this author, *De Arte historica*) cavendum esse historico ab libris belle scriptis. Nam quamvis optimum dicendi genus cum summâ veritate possit conjunctum esse: tamen tanta est animi humani fragilitas, ut vix ac ne vix quidem hæc duæ virtutes uno in homine simul possint locum habere: ita ut qui amœno et florido scribendi genere utuntur, an etiam verum dicant, merito semper dubitandum sit. Exemplo possunt esse Xenophon e Græcis, et e Latinis Curtius, qui ditissimo dicendi genere uti, fere non historias, sed Milesiacas fabulas, videntur composuisse. Potest e recentioribus exemplo esse Voltarius, quo nemo verum historiæ genium possidebat magis, nemo scripsit luculentius ac disertius, sed quo nemo plus fabularum finxit.'

The earlier volumes of this work have preceded the date of our notices: this eleventh begins with the year 1799, and with the thirty-first book of the history, and, after mentioning the king's speech, it recapitulates the debate on the habeas corpus act. It was worth while for the historian to observe, because the orators did not make the observation, that the habeas corpus act is of little value in quiet times; ministers have ordinarily no interest to interrupt the regular administration of justice: if in all unquiet times it be taken away, it might as well not exist. When the constitution is not strong enough to protect itself without despotic powers, let the constitution be strengthened by the insertion of more representatives popularly chosen; but let it not exhibit the detestable spectacle of despotism attaining the ends of orderly government, while liberty and justice are asserted to be impotent. Such profane disbelief in principle, in virtue, the representatives of the people should loudly excommunicate.

In narrating (page 120) the entrance of the French troops into Naples, Mr. Belsham talks of 'the interesting spectacle of liberty crowned by the hands of religion.' In the first place, allegorical spectacles are not spectacles at all.

"So I have seen in Araby the blest,
A phoenix couch'd upon her funeral nest."

What happened? Did the religious part of the Neapolitan people join the French? No. They adhered to cardinal Ruffo, who 'bearing aloft the crucifix in the one hand, and brandishing the sword in the other,' was very successful, especially through Calabria, in collecting recruits to oppose the invaders. The higher orders, the infidel classes, of society, were at Naples the only friends of the French; the populace were hostile, partly from the wholesome instinct of patriotism, and partly from superstition for those creeds which they knew the French despised. A few priests may have been hired with the silver spoils of their own altars to betray a country which they despaired to arouse; but the ecclesiastical order was not in the interest of the French. Their guides were found among the lawyers and students chiefly. This method of narrating in abstractions, and of substituting allegory to fact, is rarely consistent with historical precision: it is oftener adopted to conceal idleness, than to abridge the result of enquiry.

In the thirty-second book occurs a narrative of the expedition to Holland. This was the most important and the most ill-managed of all the undertakings of Great Britain during the whole war: the most important, because it directly tended to check and to limit the northern aggrandizement of France, which alone interferes with our security and our independence; and the most ill-managed, for reasons which parliamentary accommodation may have suppressed, but which the historian ought to promulgate. The expedition was fitted out too late in the season. There was a want of geographical information in landing at the Helder at all; because the passes between that place and the seats of population and authority in Holland, are defensible by an inferior force against any invader. There was so little contrivance in the equipment that half-disciplined militia-men were embarked for a difficult service; and that horses came in one ship, and their saddles in another. It was rumoured that the cavalry would either not come or not be wanted, and the saddles were thrown overboard into the mud, purely for a pier to step ashore upon. Care should have been taken to land unexpectedly in some place whence it was possible to march rapidly to Amsterdam: no cavalry should have been sent: rash battles should have been fought (this depended on the general selected); for a mere regular progress was

certain disappointment of the end in view: and a defeat was no greater evil than a detention. Such remarks the historian of his own times should collect from the individuals engaged: and he should state them without reserve; not for the purpose of exciting indignation, that would be useless, but in order that the eye of public mistrust may in future be turned on those individuals who have so conducted the cause of their country. We are fighting for our last stake. If the constitution necessarily secures to birth, to rank, to wealth, to sympathetic opinion, an influence which they deserve not, the only chance for remedy lies in vigorous denunciation. Let the historian brave an unjust exile, in order to rescue his country from ignorant, or base, or perverse councils. On this occasion, and on some others, we feel inclined to censure the urbane, the tame lenience of Mr. Belsham's criticism.

At page 205 there is an extenuatory passage in the note which respects the butchery at Jaffa. Bonaparte is represented as less blameworthy than Suwarrow. The Russians had been irritated by the previous massacre of their troops in Warsaw, which the royalists, commanded by Kosciuszko, had perpetrated. Suwarrow had vindictive feelings to satisfy, and had probably orders to satisfy them. But Bonaparte's butchery was self-willed, and a sacrifice in cold blood. And why is Bonaparte to be censured with qualification? Is he not the subverter of liberty, the abolisher of the political equality of religious sects, the conqueror of anarchy, not by voluntary, but by despotic means, free from family affection or expansive humanity, ignorant and superstitious, another Septimius Severus? If glory be at the service of such usurpers, there will be no end of them. The greatest of warriors is not the greatest of men.

In the eleventh volume the thirty-fourth chapter narrates with becoming courage a reprehensible outrage.

"Nearly at this time a most extraordinary and signal act of vengeance was inflicted on the inhabitants of Cesenatico, a small maritime town situated on the Adriatic Gulf. The municipality of this obscure place, had, it seems, according to the accounts transmitted to lord Keith, arrested a British officer charged with public dispatches. As they might, not improbably, have acted under constraint from the French troops stationed in their vicinity, it would have appeared to the world no derogation of dignity, and much more agreeable to equity, if the noble commander had made

some enquiry into the previous and attendant circumstances; instead of which, the *El Corso* and *Pigmy* sloops were, after a lapse of time which seemed to indicate that the offence, whatever might have been its magnitude, had passed into oblivion, dispatched 'to make a proper example of the town.' The boats of both vessels landed at dawn of day on the 27th of August, and, after some opposition from a body of French troops, made themselves masters of the place, which they then, agreeably to their orders, completely destroyed—the vessels and the harbour forming but one flame.—Of thirteen vessels, of different descriptions, lying within the mole of Cesenatico, two were sunk, and eleven burnt; the harbour was choked by the wreck of four purposely sunk in the mouth of it, and both piers entirely consumed. Thus did the mighty arm of Britain, by a touch rather than a blow, 'all the flourishing works of peace destroy' of an industrious and humble, but probably happy community, who could scarcely suppose the possibility of so terrible a calamity; for a revenge so dreadful, incited by an offence so trivial, was perhaps never before inflicted in any age, or heard of in any country the name of which is known among civilized nations."

The popularity of the British character among foreign nations is so essential to the success of our remote expeditions, that these wanton piratical freaks of enterprize cannot be too steadily discouraged. A less unwelcome specimen of Mr. Belsham's mode of narration will be the following:

"The routine of parliamentary business went on as usual during the illness of the king; but his majesty having now happily recovered, the appointments of the new ministers were announced in the accustomed and regular form; and on the 17th of March, Mr. Addington was sworn into his high office as first lord of the treasury, with the chancellorship of the exchequer annexed; and Mr. Pitt was divested of that power which he had exercised, in times the most eventful and important, for the long period of seventeen years; during which the character of this minister was as fully developed, as clearly discriminated, and as strongly marked, as that of any statesman who ever directed the councils of Britain. His early declaration, on the removal of lord North, and the advancement of lord Rockingham to the station of first minister, 'that he would not accept of any subordinate situation,' exhibited at once the extent and the irregularity of his ambition. In proportion as his pretensions were high, his manners were haughty. Instead of the generous feelings and noble enthusiasm of his father, he discovered a disposition selfish, cold, and artful; and it was quickly seen that he possessed no quality of youth but its presumption. In his conduct there was never found that fearless

simplicity, that dignified candour, which are the genuine offspring of an elevated mind, and the true criterion of real wisdom. At no time did he display that commanding foresight which marks a superior intellect, or that controlling prudence which knows how to avert impending mischief. At no season did he endeavour to stem the torrent of public prejudice, or to make the people calm and wise when they were inflamed and ignorant. The stream of public opinion he submitted diligently to watch; and suffered himself rather to be carried away with it, than to aim by arduous efforts to direct its course where wisdom or patriotism might suggest. The mind of the nation, under his auspices, made no advances: on the contrary, its movement was uniformly retrograde. The errors of the public he laboured to convert to his own advantage, not to correct at the hazard of his power. He was the attentive observer of times and seasons, not the beneficent and enlightened instructor of nations. His eloquence, for which he was deservedly celebrated, was chiefly characterized by what rhetoricians call *amplification*. He possessed in perfection all the modes and subtleties of reasoning, and was copious, even to the brink of verbosity. He had the faculty of speaking much and saying little; and, when silence was impracticable, he knew how to make language subservient to all the purposes of taciturnity. His solemn avowals were clothed in impenetrable darkness: and his explanations were calculated equally to elude the vigilance of the watchful and the curiosity of the inquisitive. The connexion between the means and the end appeared seldom intimate in his thoughts, and was rarely either defined in his words or exemplified in his conduct. The plans, therefore, which he designed, although prosecuted with courage, constancy, and vigour, almost invariably failed in the execution. It is remarkable, that, during the seventeen years of his administration, no one act of patronage was extended to literature, to the sciences, or the arts.

"That spirit of violence which had so long actuated the proceedings of the late administration, suffered no abatement to the very last moment of their political existence. On the 21st of January Mr. secretary Dundas, by letter, apprized the lords of the admiralty, 'that it was his majesty's pleasure to revoke the indulgence granted to the French fishermen; and that they and their boats should be henceforth subject to capture—advices having been received that these fishermen were under requisition, and that even those who had been released from prison, in order to be sent home, under the express condition of not serving again, were comprised in that requisition. It was his majesty's further pleasure, that all those set at liberty on their parole be required to return into this country; and that those among them who shall neglect to obey these orders, shall be made to suffer all the rigors of the laws of war, in case they should again be made prisoners while serving

the enemies of his majesty.' A copy of this letter was transmitted to M. Otto on the 29th of January; and he immediately apprised M. Talleyrand of this measure—the true motives of which he declared himself unable to conjecture—at the same time expressing his fears that, from the intentional delay in the communication of the order, a great number of unfortunate persons must have fallen victims to it. M. Otto also addressed, upon this occasion, a most able reply to the English government, stating his 'astonishment that mere apprehension and conjecture should have been made the ground of such a procedure, without any complaint, formally or previously offered, and much less any refusal of justice on the part of the French government. He deprecated the effect of a measure hostile to a peaceable class of people for the most part aged, invalids, or children, who were consequently incapable of hurting the enemies of their country; and whose simplicity of manners and industrious habits could not give any umbrage. Those,' he says, 'who have submitted to the English government the reports on which its late determination is founded, cannot therefore have any other view than to add to the numerous subjects of irritation which a protracted war has produced between the two nations.' This act of provocation awakened the highest degree of resentment in the mind of the first consul; and instructions were forthwith transmitted to M. Otto, to declare to the British government, 'that he could no longer remain in a country, where not only every disposition to peace is abjured, but where the laws and usages of war are disregarded and violated; but that the first desire of the French government having always been to soften, as much as possible, the horrors of war, that government cannot, on its part, think of making the poor fishermen victims to the prolongation of hostility: it will therefore abstain from all such reprisals; and, on the contrary, it has given orders for all French ships, armed for war or cruising, to leave the occupation of fishermen uninterrupted.' Such and so striking was the contrast exhibited by the two governments! But the prudence of M. Otto foreseeing that an amelioration might take place in the English councils, in consequence of the changes in contemplation, he postponed his departure till the new ministers had taken upon them the actual management of public concerns: and a favourable omen of the better spirit which now predominated in the national councils very early appeared, in the notice transmitted to M. Otto on the 3d of March, of the suspension of the late order respecting the French fishermen; and, in the sequel, the dispute was happily and silently adjusted.

"But a far more flagrant, though perhaps not in its tendency a more fatal, proof of the disposition of the late ministers to involve the nation, as it were, beyond all redemption, and to stake its very existence on the result of the quarrel, appeared in the order of council, dated the 14th of January, for laying an

embargo on all Russian, Swedish, and Danish vessels in the British ports, of which several hundreds were actually seized and sequestered. So that, far from harbouring any intention of resigning the government for the sake of effectuating the great object of peace, as some refining politicians dreamed, those daring and desperate ministers seemed rather inclined to extend and aggravate the horrors of this odious war to the utmost of their power, in order, if possible, to deter and affrighten others from undertaking the future conduct of it."

The whole conduct of Great Britain toward the northern powers, is recorded with spirited disapprobation: the first step toward a recovery of their friendship is to acknowledge the turbulence of our arrogance. Perhaps a little maritime, as well as diplomatic criticism, might have been hazarded on the battle of Copenhagen: it is said an earlier attack could have been made, with the advantage of an opposite wind, and a profounder knowledge of the soundings could have been obtained from the Hull and Yarmouth pilots who were on board the fleet. Seidelin's narrative ought to have been consulted as a corrective of the English accounts.

In the thirty-fifth chapter Mr. Belsham applauds the clergy-incapacitation act. Why is this state never to avail itself of the Wolseys, the Richlieus, the Ximenes, the Leo X., the Talleyrands, who may happen to originate among its clergy? Why is any specific form or grade of religion to disqualify from public office? Why are holy orders to be treated as a disgrace, and to debar a man from sitting among the representatives of his country? Above all, why is the character of priest rendered indelible, and made an infliction for life, even on those who renounce it? This bill is the creature of a vile superstition, and proceeds on the supposition that it is sacrilege to secularize what has once been dedicated to God. Suppose it were necessary to bring in a bill for the repeal of the act of uniformity, it could not conveniently originate in the lower house, because there can be no clergy to overlook and criticize its provisions. The Commons have defrauded themselves of a power of legislating in church affairs. There was a time when Mr. Wyvill was the natural candidate for Yorkshire, and when popular gratitude ought to have placed him on the hustings. At all times the best orators among the clergy are the natural representatives for Oxford and Cambridge.—But there's the rub. Persons high in power began to ap-

prehend, it is said, clerical antagonism and an encroachment on the equality of the civil rights of the people of Great Britain weighs nothing against a personal accommodation.

At page 322 Mr. Belsham a little out of his course to comment the constitution, or fundamental religious legislation of the French. It is well known that French policy concerning religion is borrowed from that which the peace of Westphalia legalized in Germany, and borrowed for the purpose of facilitating German conquests. The privileges of establishment are conceded to three distinct sects: the Romish, the Lutheran, and the Calvinist, and all others are in the eye of law not even tolerated: thus a sort of unitarian trinity in unity becomes the exclusive religion of the state; and the magistrate distributes the ecclesiastical ferment of the three rival parties. In the case of the protestant sovereignty of Germany this policy softened the animosities between the two protestant sects and nearly melted them into one; the catholics grew less numerous. In the case of the catholic sovereignty of France we shall see the protestants grow less numerous. Indeed we already see the protestant prefects attending mass, and accepting incense at the hands of the catholic priesthood; and this occasional conformity is applauded by protestant ministers, who are candidates for the patronage of Bonaparte. It surprises us that Mr. Belsham should delight in the coestablishment of three sects, of which the unitarian is not one.

In the XXXVIth Book Mr. Belsham narrates the peace of Amiens, and debates upon it. Those who wished to keep the peace, of course, praised it; the whole; those who wished to break the peace, of course dispraised it: but it was so unskilfully made, that neither party was satisfied. Something might have been added to the parliamentary criticism of the measure. Instead of agreeing to evacuate Egypt, it would have been better to dispose of it, and to dispose of it in favour of the French. The Cape, Pondicherry, and New Orleans, and Malta too, would have been all abandoned readily to us: and the French would have had a colonial drain for men of spirit and adventure; who, if pent up in European France, will constantly be overflowing contiguous departments, and strengthening their country by annexations where her strength is a misanthrope.

from Egypt France cannot hurt our Hindostan; and with Egypt all her aggrandisement would tend southerly, wheré it is innocent, and not toward Holland, and the Weser, and the Elbe, where it is menacing indeed. It was the project of Leibnitz (See Annual Review, VOL. II. p. 6), to give Egypt, the African Holland, to France, in order that she might spare European Holland. In three generations more the ministers of Britain will perhaps attain to that degree of prospective wisdom, which the literary world possessed three generations ago. Too soon one is reminded of the truth of the Swedish chancellor Oxenstierna's remark, how little wisdom is made use of in governing the world, *quidam parvâ sapientiâ regitur mundus*. A gross instance of statistical ignorance occurs in lord Hawkesbury's speech (p. 379): 'The cession of Louisiana by Spain, to France, is another ground of complaint. That province had originally been a French colony, having been ceded by France to Spain after the treaty of 1763. The value of it at present was nearly nominal. As a naval station New Orleans was unimportant.' Here the value of Louisiana, which sold for several millions, is represented as merely nominal: and New Orleans is wrongly placed in Louisiana; and is of course erroneously supposed by the minister to have passed into the hands of the North Americans when they purchased that country: whereas the purchase of New Orleans was the subject of a subsequent treaty, which is probably contrary to the law of nations. New Orleans could have been asked for, in the negotiation of the peace, but was forgotten. And New Orleans, which is to the Mississippi what Alexandria is to the Nile; which must become the depository of the produce of all the interior of North America; which, by means of a canal into the Bay Spirito Santo, can be made accessible for ships from the sea even during the overflowings of the river; which is likely to grow with the rapidity of Liverpool, and to outgrow it by all the difference between the Mersey and the Missouri; is held up as an *unimportant* place of shipping. No wonder that the island, on which New Orleans stands, was neither attacked during the war, nor treated for at the peace; although it begins to be already, what Trinidad cannot of a century become, the emporium of an inland commerce through well-watered provinces, where the arts of civilization, and the

wants of luxury, have struck root, and are growing. But however deficient lord Hawkesbury may have been in those geographical studies, which to a negotiator are indispensable, we cannot agree with Mr. Belsham in the censure past on his conduct (p. 395) respecting the French emigrants resident here. We do hold it for the king's dignity to protect entirely the obeyers of the laws; and should not murmur at a war undertaken to prevent the quondam lodgers in Holy-rood house from being turned out at the instigation of Bonaparte.

Mr. Belsham has displayed, in the accomplishment of his vast task, perseverance, sincerity, principle, a love of liberty, and an independence of character, of rare example. He may be considered as the bishop Burnet of the present age; as an historian of his own times, who possesses almost the same unaffectedness of manner, the same honesty of nature, pushed occasionally by whiggish warmth beyond the exact path of impartiality; who has perhaps less continental literature, but who has more fearlessness of power, and a purer indifference to patronage.

Had Mr. Belsham's history been dedicated to the prince of Wales, he might aptly have repeated the words of Tindal's celebrated address. 'Here then, as from a faithful monitor, uninfluenced by hopes or fears, your royal highness will learn, in general, that to a prince nothing is so pernicious as flattery, nothing so valuable as truth; that proportionate to his people's liberty and happiness, will be his glory and strength; that true valour consists not in destroying, but in protecting mankind; not in conquering kingdoms, but defending them from violence; that a prince's most secret counsels, motives, and pursuits, will probably one day be published and rigorously judged; and, however flattered while living, yet, when dead, he will be treated as his actions have deserved, with honour or reproach, with veneration or contempt. But above all, you will here see the nature of our excellent constitution, where the prerogatives of the crown and the privileges of the subject are so happily proportioned, that the king and the people are inseparably united in the same interests. Accordingly you will here constantly find, that in the reigns where this union was cultivated, the kingdom flourished, and the prince was glorious, powerful, trusted, beloved; on the contrary, when by an arbitrary disposition or evil counsels, it

was interrupted, the constitution languished, mutual confidence vanished, distrust, jealousy, and discord arose; and, when entirely broken, as was sometimes the case, confusion and civil war ensued.

This passage is deservedly classed among those praises proceeding from a good inclination, accompanied with reverence, which lord Bacon considers as the appropriate form of addressing kings, and great personages: *laudando præcipere*. By affecting to lay before them

what they are, you may humbly put them in mind what they should be.

But he is not less useful who *teaches* *dispraise*; who, by censuring the faults of former princes and governors, shall deter their successors from jealousy against the progress of freedom, from intolerance for the variations of superstition, and from a conniving indifference to the extravagant augmentation of court patronage and expensiture.

ART. III.—*Historical Fragments of the Mogul Empire, of the Marattoes, and of the English Concerns in Indostan; from the Year 1639: origin of the English Establishment, of the Company's Trade, at Broach and Surat; and a general Idea of the Government and People of Indostan.* By ROBERT ORME, Esq. F. A. S. To which is prefixed, *Account of the Life and Writings of the Author.* 4to. pp. 472.

MR. ROBERT ORME was born at Anjengo, in the Travancore country, on the 25th December, 1728, and was sent over to England for education at two years of age. His father, a physician on the Company's establishment, consigned this son to an aunt of the name of Adams, who resided in Cavendish-square, London. There he received the elements of education, and was put at six years of age to Harrow-school. In 1742 he returned to Calcutta, where he was placed in the house of Jackson and Wedderburn, in order to be qualified for commercial pursuits. A writership had been obtained for him in England; and at the end of five years, as is the usual routine, he became a factor. His attention to commerce was assiduous and profitable; he made a voyage round the Peninsula to Surat; he penetrated into the interior to make purchases. His intelligence became so conspicuous that in 1752 he was consulted about the reform of the police of Calcutta, and suggested a separation of the powers hitherto confided to a single Janadar. He drew up at this period a general idea of the government and people of Hindostan, now first published entire: it was corrected and completed on board the Pelham, in which vessel he went, in 1753, to Europe.

Lord Holderness was at that time a secretary of state: he consulted with Mr. Orme, and corresponded with him: he attended minutely to his advice, and began a negotiation with the French ministers for the purpose of thwarting the ambitious projects of M. Dupleix in India. The wise suggestions of Mr. Orme occasioned the adoption of a train of measures, which lord Clive was appointed to conduct, and which terminated so advantageously for the British interests. Mr.

Orme went on a confidential mission back to Hindostan, in 1754, and sailed on his return for Europe in 1758. Unfortunately the *Grantham*, in which he embarked, was taken by the French, and carried to Mauritius; thence he got to Nantes in the spring of 1760: he passed some months agreeably in the French metropolis, and came to London the following October. A new house was purchased for him in Harley-street: he arranged there his valuable library, and began to compose the *History of the Military Transactions of the British Nation in Hindostan*. He had collected for this purpose, while in the East, the requisite documents. The first volume was published in August, 1763: in the *Annual Register* for the following year it was reviewed or characterized, as is supposed by Mr. Burke.

"The manners and characters of the various people who inhabit the great empire of Hindostan, the peculiarities of their religion and their policy, and the astonishing events which have lately happened in that part of the world, have rendered the history of the war in India an object of general curiosity. The great interest we have still in that empire, always as a trading, lately as a conquering people, will make a proper narration of our former proceedings there a matter of the most useful instruction. The author of this work has gratified this curiosity, and communicated this instruction. No historian seems to have been more perfectly informed of the subject on which he has undertaken to write; and very few have possessed more fully the talent of impressing it, in the clearest and most vivid manner, on the imagination and understanding of his reader. In this work the events are fully prepared; the characters strongly delineated; and the situations well described. It is no uncommon thing to find in ordinary writers more of the confusion, than of the life

and spirit of the fight, in their descriptions of an engagement. But nothing can be more clear and satisfactory than the whole detail of military transactions which we find in this work. Whether the march or the retreat, the attack or the defence, the encampment or the battle, every thing is drawn with accuracy and precision, in great detail, but without any tediousness. In these particulars, Polybius will be scarcely thought to exceed him.

"It must be observed likewise to his history, that there reigns through the whole an air of disinterestedness, and of freedom from all passion and prejudice, public or private. The Frenchman who acts gallantly wisely, finds as much justice done to his actions and his conduct, as any of the author's countrymen. The same impartiality seems to have been observed with regard to all personal connections. This volume does not try the war further than 1755."

Mr. Orme was elected a fellow of the Society of Antiquaries in March 1770: and was soon after appointed historiographer to the India Company, with a salary of four hundred pounds yearly. He visited France a second time in the spring of 1773, and was introduced to general Murray; who expressed his satisfaction at the justice done by Mr. Orme to the French officers, invited him to his villa, and communicated some maps and other instructive documents, of which Mr. Orme availed himself in the second edition of his book, which appeared in the following summer. Two years later, in 1775, an appendix, containing several notes and an index, was issued in addition to the first volume: the second volume was published in October 1778. In 1785 a third edition became requisite, and Mr. Orme undertook to prepare notes and an index to the second volume similar to those which had been annexed to the first; but the declining state of his health interrupted the progress of this toil.

In 1782 Mr. Orme gave to the press *Historical Fragments of the Mogul Empire, of the Morattoes, and of the English concerns in Hindostan*, from the year 659. This laborious work had been in preparation long: it was intended to assume a completer form; but a marked decay of vigour and a disinclination for study occasioned an abandonment of the pursuit of higher perfection.

Mr. Orme's debility was of that kind which British constitutions often incur from the effects of the climate of Hindostan: it did not unfit him for lively participation in the pleasures of society, or in the incidents of public affairs. He possessed and indulged the accomplishments

of the luxurious world. He listened frequently to music; he visited and criticized the exhibitions of painters and the galleries of art; he prized the pleasures of the table, and the conversations of the literate; he composed verses, his address to the moon and the accompanying melody still remain engraven in our song-books. He exchanged the atmosphere of London for that of Ealing in 1792, and only came to Harley-street during a month or two of the winter: he sold the city-house in 1796. At Ealing he died, in January 1801, in the seventy-third year of his age; and bequeathed to the India Company those parts of his library, chiefly manuscript, which related to the history, the literature, and the affairs, of the East. Anquetil du Perron, who was a judge both of the oriental and of the European acquirements and information of Mr. Orme, characterizes him as *eruditissimus et veritatis amanissimus India historiographus*. (See the *Oup'nechat*, vol. ii. p. 755.)

The rank of Orme among our historians is not well ascertained or universally agreed: he is seldom mentioned as the rival, still less as the surpasser, of Robertson: yet we suspect that an impartial inquiry into the relative merits of these two writers would terminate in awarding the preference to the native of Travancore.

Gibbon is the greatest of our historians: for appropriate learning and research; for judgment and sagacity in the conciliation of testimony, and in the approbation of character; for force of thought and stateliness of diction; he is alike admirable: the fault of his matter is the disproportion of the parts, of his style to narrate in abstractions.

The second rank must be conceded to Hume. The author of a dissertation on the literary history of Scotland, prefixed to some recent lives of the Scottish poets, has thought fit (p. 167) to attempt the degradation of Hume below Robertson, with a zeal more honourable to his christian than to his critical orthodoxy. Of Robertson's high merit we are amply convinced: his best history however is that of Charles V.: great part of the work respects the affairs of the Germans; yet he does not appear to have consulted a single one of their native vernacular writers on the subject of these affairs. He is deficient therefore in the first quality of an historian, *research*. In Thucydides, in Tacitus, in Machiavelli, one admires a strength of mind, an energy of intellect, a thinking force, which sometimes reveals

itself in their burning words, sometimes in the sharpness of their personal characterizations, sometimes in the depth of their moral and political inferences and reflections. But who can find up in his common-place book a single striking maxim extracted from the writings of Robertson? In what are our statesmen the wiser for his narration? By the facts alone. He is deficient then in a second desirable quality of the historian, which might not unaptly be termed *thoughtfulness*.

Hume also wants research. The History of the House of Tudor was his first and his best historic effort: that of the House of Stuart is partial, and not sifted: his Ancient History of England is notoriously inferior to that of Milton. But Hume displays the thinker, exercises the philosopher, and instructs the statesman. Robertson's whole knowledge seems confined to his topic; Hume's to embrace every other: yet Hume is then most excellent, when he draws not from without, but from within. The style of Robertson is plain, not always clear, though often picturesque. The style of Hume is tame, but beautiful; it is far superior for purity, euphony, precision, and selection of ornament, to that of Addison, whom he imitated: it is the transparent garb of ideas shapen with the chisel of a master.

Without the strength of mind or the classical learning of Gibbon and of Hume, Mr. Orme excels the former in the proportion and disposition of his matter, and the latter in inquiry and fidelity. His preliminary dissertation has been compared and preferred to the introductory book of Thucydides; to whom he is only inferior in not decorating his speeches and narrations with the inferences of a sententious wisdom. Orme is a more instructive historian than Robertson: practical men can rely on the one, not on the other. Compare the siege of Pondicherry at the close of the first book of Orme, with the siege of Metz in the eleventh book of Robertson: a military man will better know how to invest Pondicherry in future from Orme's account; but nobody can learn from Robertson how to defend or attack Metz. The use of history is to preserve the lessons of experience.

In the characterization of individuals, Orme draws his inferences from facts and observations, not from the balance of testimony: but Robertson leans wholly on the accident of testimony; and, sooner than miss an opportunity of drawing a parade character, he gives a fictitious importance

to insignificant men. Thus for pope *Mucellus* II. he provides as pompous a panegyric, as if this old man had been elected for his efficacy, and not for his decrepitude. The character of Luther, again, is a mere repetition, and a very tedious one, of ecclesiastical puffs; his low buffoonery, and his insincere use of vulgar credulity, in asserting the apparition of the devil, and in professing to receive the Apocalypse after having denied its canonicity, when he found it could be employed as a tool against the church of Rome, are suppressed, dishonestly, by Robertson, but from ignorance of facts, which he seldom looks for at the source. How superior is Orme's character of Dupleix, (book v. year 1762) where the grounds of every panegyric are recorded, and the most exemplary and exquisite justice is shewn to an enemy. Orme is superior to national prejudice. Robertson, imbued even with sectarian Orme contents himself with noticing what is peculiar; Robertson prolongs his definition with scholastic phrases, of universal applicability. Orme paints from nature. Robertson from books: Orme with precision of portraiture.—Robertson with the vague distortion of the rhetorician. Orme has too great a crowd—Robertson too thin a groupe of agents. Orme on our neglect to the strangeness of his personages—Robertson our favour to the celebrity of his. Orme is growing on our interest with the empire whose origins he sketched—Robertson is fading on our interest with the dissolution of the religious and political parties which he described but did not dare to criticise. Orme is the raciness, and foliage, and verdure, of living history, sprung up among the mountains and on the spot—Robertson the scarce-vested stateliness of the monumental trophy.

Qualis frugifero quercus sublimis in agro
Exuvias veteres populi, sacrataque gestas
Dona ducum: nec jam validis radicibus
hærens,
Pondere fixa suo est, nudosque per æta
ramos
Effundens, trunco, non frondibus, effusa
umbram.

The works collected in this volume form an essential appendix to Orme's History of the Military Transactions of the British Nation in Hindostan. They consist of the Historical Fragments of the Mogul Empire, first published in 1782; and of three posthumous publications, drawn up on specific occasions; namely, 1st, Orme's

of the English Establishment at Broach and Surat. 2d, Idea of the Government and People of Indostan. 3d, Effeminacy of the Inhabitants of Indostan. These tracts are accompanied with maps, with some elucidations, and with a biography of the author. From the last of these dissertations, which constitute the only wholly new portion of the volume, we shall borrow some valuable observations.

"This great extent of country has, from the earliest antiquity, been inhabited by a people who have no resemblance, either in their figures or manners, with any of the nations which are contiguous to them; and although these nations have, at different times, sent conquerors amongst them, who have established themselves in different parts of the country; although the Mogul Tartars, under Tamerlane, and his successors, have, at last, rendered themselves lords of almost the whole of it, yet have the original inhabitants lost very little of their original character by these mixtures; contrary to the effects of conquest in all the Christian, and in most of the Mahomedan empires, in which Cyrus, Vercingetorix, and Cæsar, if risen from the dead, could not distinguish any traces of the men who obeyed them in Persia, in Gaul, and in Italy; but this might Porus in India, on the very spot in which he submitted to Alexander.

Besides the particular denominations which they receive from the casts and countries in which they are born, there is one more general, which is applied indiscriminately, to distinguish the original natives from all who have intruded themselves amongst them; Hindoo, from whence Indian. And throughout the millions of Indians which inhabit Indostan, although situated at such distances as would suffice to form them into several distinct nations, are visible the strongest marks of one general character, in their dispositions, in their observances, and in their form.

"The colour of the Indians is, generally, either that of copper, or of the olive, but both with various shades. It is not absolutely the proximity of the inhabitant to the equator, that determines his complexion in India; other physical causes, from differences which arise as by starts, in regions equally distant from the sun: and it is in their complexion that less national generality is found, than in any other of the properties of their figure: some are almost black; but these are either inhabitants of the woods, or people inured to labour and fatigues uncommon to the rest of their countrymen.

"The hair of the Indians is, without exception, long, fine, and of a jet black. The nose, if not always aquiline, is never buried in the face, nor with large distorted nostrils, as in the Coiffrees of Africa, and in the Malay nations. Their lips, though in general larger than in Europeans, have nothing of that disagreeable protuberancy projecting beyond the nose, which characterises the two people

just mentioned. The eyebrows are full in the men, slender in the women, well placed in both. The eyelid is of the finest form,—long, neither opening circularly, as in many of the inhabitants of France, nor scarce opening at all, as in the Chinese. The iris is always black, but rarely with lustre, excepting in their children, and in some of their women: nor is the white of the eye perfectly clear from a tinge of yellow; their countenance, therefore, receives little animation, but rather a certain air of languor, from this feature. From the nostrils to the middle of the upper lip they have an indenture, strongly marked by two ridges, seldom observable in the northern Europeans, but often in the Spaniard and Portuguese; and from the middle of the under lip there is another such indenture, which loses itself a little above the chin: these lines, chiefly remarked in persons of their habits, give an air of sagacity to the men, and of delicacy to the physiognomy of the women. The outline of the face is various, oftener oval than of any other form, particularly in the women; and this variety of outline is another of the principal characters which distinguisheth the Indian from the Tartar as well as Malay; whose faces are universally of the same shape; that is, as broad as they are long.

"The climate of India is divided into two seasons: from the month of October to March, the wind continually blows from the northern, and in the other months from the southern points of the compass. These seasons, called by navigators monsoons, are suspended twice in the year, for the space of twenty or thirty days, whilst one of the reigning winds is losing and the other acquiring strength. The southern winds, passing through regions inflamed by a perpendicular sun, and accompanying its approach, diminish nothing of its influence; the season of their duration is, therefore, very hot indeed. The northern winds, after having scoured the vast plains of Tartary, receive additional keenness in their passage over the summits of mount Caucasus, covered with eternal snows: they bring intense cold into the countries which lay at the foot of these mountains; but do not carry more than a very moderate degree of it beyond the 30th degree of latitude; for as, during the whole time of their continuance, the air is pure and unclouded, the sun has always heat at noon; and so much in the southern parts of India as to give Europeans very little, if any sense of cold, not more than that of the month of June in England.

"The texture of the human frame in India, seems to bear proportion with the rigidity of the northern monsoon, as that does with the distance from Tartary; but as in the southern monsoon heats are felt at the very foot of mount Caucasus, intense as in any part of India, very few of the inhabitants of Indostan are endowed with the nervous strength, or athletic size, of the robustest nations of Europe.

"On the contrary, southward of Lahore,

we see, throughout India, a race of men, whose make, physiognomy, and muscular strength, convey ideas of an effeminacy which surprises when pursued through such numbers of the species, and when compared to the form of the European who is making the observation. The sailor no sooner lands on the coast, than nature dictates to him the full result of this comparison; he brandishes his stick in sport, and puts fifty Indians to flight in a moment: confirmed in his contempt of a pusillanimity, and an incapacity of resistance, suggested to him by their physiognomy and form, it is well if he recollects that the poor Indian is still a man.

"The muscular strength of the Indian is still less than might be expected from the appearance of the texture of his frame. Two English sawyers have performed in one day the work of thirty-two Indians: allowances made for the difference of dexterity, and the advantage of European instruments, the disparity is still very great; and would have been more, had the Indian been obliged to have worked with the instrument of the Europeans, as he would scarcely have been able to have wielded it.

"As much as the labourer in Indostan is deficient in the capacity of exerting a great deal of strength at an onset, so is he endowed with a certain suppleness throughout all his frame, which enables him to work long in his own degree of labour; and which renders those contortions and postures, which would cramp the inhabitant of northern regions, no constraint to him. There are not more extraordinary tumblers in the world. Their messengers will go fifty miles a day, for twenty or thirty days, without intermission. Their infantry march faster, and with less weariness, than Europeans; but could not march at all, if they were to carry the same baggage and accoutrements.

"Exceptions to this general defect of nervous strength, are found in the inhabitants of the mountains which run in ranges, of various directions, throughout the continent of Indostan. In these, even under the tropic, Europeans have met with a savage whose bow they could scarcely draw to the head of a formidable arrow, tinged with the blood of tigers, whose skins he offers to sale. Exceptions to the general placid countenance of the Indians, are found in the inhabitants of the woods, who, living chiefly on their chase, and perpetually alarmed by summons and attacks from the princes of the plains, for tributes withheld, or ravages committed, wear an air of dismay, suspicion, treachery, and wildness, which renders them hideous; and would render them terrible, if their physiognomy carried in it any thing of the fierceness of the mountaineer.

"The stature of the Indian is various: the northern inhabitant is as tall as the generality of our own nation: more to the south their height diminishes remarkably; and on the coast of Coromandel we meet with many whose stature would appear dwarfish, if this

idea was not taken off by the slimness and regularity of their figure. Brought into the world with a facility unknown to the labourers of European women; never shackled in their infancy by ligatures; sleeping on their backs, without pillows; they are, in general, very straight, and there are few deformed persons amongst them.

"Labour produces not the same effect on the human frame in Indostan as in other countries: the common people, of all sorts, are a diminutive race, in comparison with those of higher casts and better fortunes; and yield still more to them in all the advantages of physiognomy. Prohibited from marrying out of their respective tribes, every cast seems to preserve its respective proportion of health and beauty, insanity and ugliness. There is not a handsomer race in the universe, than the Banians of Guzerat: the Haramcores, whose business is to remove all kinds of filth, and the buryers and burners of dead bodies, are as remarkably ugly.

"Nature seems to have showered beauty on the fairer sex throughout Indostan, with a more lavish hand than in most other countries. They are all, without exception, fit to be married before thirteen, and wrinkled before thirty—flowers of too short a duration not to be delicate; and too delicate to last long. Segregated from the company of the other sex, and strangers to the ideas of attracting attention, they are only the handsomer for this ignorance; as we see in them, beauty in the noble simplicity of nature. Hints have already been given of their physiognomy: their skins are of a polish and softness beyond that of all their rivals on the globe: a statuary would not succeed better in Greece itself, in his pursuit of the Grecian form; and although, in the men, he would find nothing to furnish the ideas of the Farnesian Hercules, he would find, in the women, the finest hints of the Medicean Venus.

"If we consider the impossibility of a stranger being admitted into any one cast, to which a Bramin will administer any of his sacerdotal functions, and the universal restriction of marriage to persons of the same cast, we shall not be surprised to find that the Indian has preserved his physiognomy from a resemblance with any of his neighbours.

"Montesquieu attributes much to the effect of climate; and his critics impute to him, to have attributed much more, to this effect than he really does. It is certain, that there is no climate in which we may not find the same effects produced in the human species, as in climates entirely different in situation, and in every other circumstance. The Sybarites, whose territory was not more than a day's journey from the country of the Horatii, the Cincinnati, and the Scipios, were more effeminate than the subjects of Sardanapalus; and there are Sybarites at this day, in the country of Vercingetorix. The Britons, although they possess, at this day, all the courage of their painted ancestors, who beat

the greatest general of the world out of their country, are, doubtless, incapable of bearing like them the fatigues and hardships of a campaign.

"But it would be to contradict all our feelings, not to allow that it is much more difficult to bring the human race to particular habits in some countries than in others. To make a Sybarite of an inhabitant of the 50th degree of latitude, infinite inventions must have been carried to the greatest degree of perfection: apartments must be closed and fuelled so as to render the alterations of seasons little sensible to him: he must be carried in vehicles, contrived to be as warm as the apartments he leaves, and almost as easy as the chair in which he slumbers: his food must be every thing that is not simple.

"To produce the same effect in such a climate and such a country as Indostan; nothing is necessary but to give the man his daily food. The effect of the sun on the perspiration of the human body, together with the softness of the air, render this secretion in India more powerful than the effect of labour in other countries. The awkward constraint arising from rest in northern climates, is the call of nature to throw off something obnoxious to the habit, or to quicken the circulation into warmth. Sensible of neither of these impulses, and satisfied with the present sense of ease, the inhabitant of Indostan has no conception of any thing salutary in the use of exercise; and receiving no agreeable sensation from it, esteems it, in those not obliged to it by necessity, ridiculous, or the effect of a discontented spirit.

"This general tendency to indolence being admitted, we shall find nature encouraging them in it.

"The savage, by his chase, and the perpetual war in which he lives with the elements, is enabled to devour, almost raw, the flesh of the animals he has killed. In more civilized nations, the plowman, from his labour, is enabled to digest, in its coarsest preparations, the wheat he has sown. Either of these foods would destroy the common inhabitant of Indostan: as he exists at present his food is rice.

"To provide this grain, we see a man of no muscular strength carrying a plow on his shoulder to the field, which the season or reservoirs of water have overflowed. This slender instrument of his agriculture, yoked to a pair of diminutive and feeble oxen, is traced, with scarce the impression of a furrow, over the ground, which is afterwards sown. The remaining labour consists in supplying the field with water; which is generally effected by no greater a toil than undamming the canals, which derive from the great reservoir. If, in some places, this water is drawn from wells, in most parts of India it is supplied by rain; as the rice in those parts where the rainy season is of two or three months' duration, is always sown just before this season begins. When reaped, the women sepa-

rate the grain from the husk, in wooden mortars, or it is trampled by oxen. Instead of hedges, the field is inclosed with a slender bank of earth.

"A grain obtained with so little labour, has the property of being the most easily digestible of any preparation used for food, and is therefore the only proper one for such an effeminate race as I have described. It is wheat in India; it is produced only in the sharper regions, where rice will not so easily grow, and where the cultivator acquires a firmer fibre than the inhabitant of the plain. It was, probably introduced with the Alcoran, as all the Mahomedans of northern extraction prefer it to rice, as much as an Indian rejects a nourishment which he cannot well digest, even in its finest preparation.

"Water is the only drink of every Indian, respectable enough to be admitted into their assemblies of public worship, as all inebriating liquors are forborn, through a principle of religion; not that the soil is wanting in productions proper to compose the most intoxicating, nor themselves in the art of preparing them for the outcasts of their own nation, or others of persuasions different from their own, who chuse to get drunk. They have not equally been able to refrain from the use of spices, and these, the hottest, without which they never make a meal. Ginger is produced in their gardens, as easily as radishes are in ours: and chilli, the highest of all vegetable productions used for food, inasmuch that it will blister the skin, grows spontaneously: these, with turmeric, are the principal ingredients of their cookery, and by their plenty are always within the reach of the poorest. A total abstinence from animal food is not so generally observed amongst them as is imagined; even the Bramins will eat fish; but as they never prepare either fish or flesh, without mixing them with much greater quantities of spices than Europeans suffer in their ragouts, animal food never makes more than the slightest portion of their meal; and the preference of vegetables, of which they have various kinds in plenty, is decisively marked amongst them all. The cow is sacred every where: milk, from a supposed resemblance with the amritam or nectar of their gods, is religiously esteemed the purest of foods, and receives the preference to vegetables in their nourishment.

"If the rice harvests should fail, which sometimes happens in some parts of India, there are many other resources to prevent the inhabitant from perishing: there are grains of a coarser kind and larger volume than rice, which require not the same continuation of heat, and at the same time the same supplies of water, to be brought to perfection: there are roots, such as the Indian potatoe, radish, and others of the turnip kind, which, without manure, acquire a larger size than the same species of vegetable in Europe, when assisted with all the arts of agriculture, although much inferior to those of Peru, of which Garcilassa

della Vega gives so astonishing a description: there are ground fruits of the pumpkin and melon kind, which come to maturity with the same facility, and of which a single one is sufficient to furnish a meal for three persons, who receive sufficient nourishment from this slender diet. The fruit-trees of other countries furnish delicacies to the inhabitant, and furnish any thing more; in India there are only which furnish at once a delicacy and no contemptible nourishment: the palm and the cocoa-trees give in their large nuts a gelatinous substance, on which men, when forced to the experience by necessity, have subsisted for fifty days: the jack-tree produces a rich, gummy, and nutritive fruit: the papa and the plantain-tree grow to perfection, and give their fruit within the year: the plantain, in some of its kinds, supplies the place of bread, and in all is of excellent nourishment. These are not all the presents which the luxuriant hand of nature gives as food to the inhabitant of India; but as the natural history of this country is reserved for more diligent and able enquirers, this imperfect enumeration is sufficient to prove that the Indian, incapable as he is of hard labour, can rarely run the risk of being famished; and that, from the plenty which surrounds him, he is confuted in the debility in which we now see his frame.

"Nature has made them still other presents, which supply many other of their wants, without exacting from them the exertion of much labour. The bamboo, which grows every where, requires only one stroke of the hatchet to split it from one end to the other, and to divide it into laths of all lengths, and of the smallest sizes; at the same time that, intire, it is large and strong enough to serve as the support of such houses as the climate demands; for in the greatest part of Indostan the bare earth affords a repose, without the danger of diseases to so temperate a people. The palm and the cocoa-nut-tree give their large fan leaves, which naturally separate into several long divisions, with which a mat may be made in a few minutes: a number of these mats laid over the scaffolding, erected with no other materials than the bamboo and packthread, compose, in a day, a house, in which the Indian may live for six months, in those parts of Indostan which are not subject to much rain. If a better house is required, walls of mud are carried up to the height of six or seven feet, and rendered, in a few days, extremely hard, by the intense heat of the sun: these are covered with thatch, made of rushes, or the straw of rice; and many persons of good casts, and far from distress in their fortunes, even Bramins, are satisfied with such a habitation. There are bricks, and very good ones, in India; but a brick house is a certain mark that the inhabitant is extravagant or rich.

"The sun forbids the use of fuel in any part of the year, as necessary to procure warmth; and what is necessary to dress their victuals, is chiefly supplied by the dung of their cows.

"The want of raiment is scarce an inconvenience; and the most wealthy remain, by choice, almost naked, when in their own families, and free from the intercourse of strangers; so that all the manufactures of cloth, for which India is so famous, derive more from the decency of their character, the luxurious taste of a rich and enervated people, and from the spirit of commerce which has prevailed among them from time immemorial, than from wants really felt; and if the manufacture of a piece of cloth was not the least laborious task in which a man can be employed in India, it is probable that the whole nation would, at this day, be as naked as their Gymnosophists, of which the ancients say so much, and knew so little. Breathing in the softest of climates; having so few real wants; and receiving even the luxuries of other nations with little labour, from the fertility of their own soil; the Indian must become the most effeminate inhabitant of the globe; and this is the very point at which we now see him."

The founders of the printing-press at Calcutta, have prepared the obliteration of these enduring habits. Where printing is unknown, tradition supplies the place of recorded experience: it is there, in fact, the most perfect form of preserving the inferences drawn by our ancestors, from their local observation. It is entitled to the same sort of deference and obedience which we Europeans shew, in many questions of morals, to the opinion of the higher classes, or of the world, where our sacred books, and our moral philosophers, have decided differently from the world. It does not follow that a prevailing practice is wrong, because the motive for it has not yet been translated into words, and intelligibly recorded. But now that we print about every thing, and about nothing more frequently or more usefully than the moral habits of the several peoples of the earth, every nation in its turn is put on the defensive, and obliged to account for its practices, or to abandon them. The authority of ridicule is a counterpoise to the authority of tradition. Laughter is, in almost all cases, a retrograde motion of traditional impressions. The satyrist, the comic writer, the novelist, so soon as they can diffuse, in the language of the Hindoos, their criticisms, can cause to be dropped, by imitation, whatever practice was learned by imitation; unless there is a reason in nature, a cause founded in the circumstances of the time and place, for such practice. Ridicule is never successful against a rational practice, because men return to it for the same reasons which occasioned its institution; they learn again, experimentally, what they

had left off from ignorance of the motives which led to its adoption; they come again *a posteriori* to the usage which an *a priori* syllogist had exploded. If they record their experience when they resume their usage, ridicule not only can never triumph again, but cannot even be brought to bear against such usage. We can no more laugh at a proposal to reverse actions wisely willed, than at a paralytic stroke. Where marriage takes place so early as in Indostan, tradition needs to have great weight. The boy and girl housekeepers could not go on, unless they took almost every action of life upon trust, and managed by imitation like their parents. By the time they have learnt they have got to teach the arts of life: not the slightest interval, during which the acquirements of education could be compared with the wants of society, is allowed. The child must be educated exactly like its parents, or not educated at all, wherever the system of very early marriage prevails. Early gestation shortens the endurance of feminine beauty. This circumstance, added to the legal permission of divorce, must render the proportion of faded widows, whose endowments are coveted, very considerable in the East; and may have favoured that

inhuman state of opinion in which widow-burning was preached into vogue. In order to abolish the practice, our oriental novelists should make the attack on the surviving relations, and represent them as in conspiracy with the priest, to seize and divide the property of the sacrificed enthusiast. Let it become a disgrace to a family, that, from eagerness to inherit, it avoided to dissuade the voluntary death of a mother. But these are speculations, in which it is rash to indulge without local observation.

These, like all the other productions of Mr. Orme, will be a lasting honour to his country: nor has the utility derived from them, practically, been less conspicuous than their literary merit. We trust that the possessors of the History will occasion a sufficient demand to clear off the copies printed of this supplemental volume, and that a new edition of the works of Orme, chronologically arranged, will speedily illustrate the London press.—We are not convinced that Mr. Orme's orthography of proper names ought always to be respected; and we recommend that, at least in the indexes, the oriental orthography be given in Persian characters.

ART. IV.—*An Historical Account of the Black Empire of Hayti: Comprehending a View of the principal Transactions in the Revolution of St. Domingo, with its Ancient and Modern State.* By MARCUS RAINSFORD, Esq. late Captain of the Third West-India Regiment, &c. &c. 4to. pp. 467.

CAPTAIN Marcus Rainsford has passed about twenty-five years of his life in the British service, and was on duty in the West Indies during the late war, at the time of the attack on St. Domingo. After the evacuation of the island by the British troops, Mr. Rainsford took occasion to embark in Jamaica for Martinique, on board a Danish schooner, the *Maria*, which was overtaken by a hurricane, and obliged to seek refuge in Cape François; it was thought most expedient and most safe to announce him as an American passenger, in which capacity he was freely received by Toussaint L'Ouverture, and saw much of the internal composition of the black republic. The information collected during that interesting residence was laid before the public in a small book, which was reviewed in our first volume. Other particulars have since been collected of the negro-insurrection, an introductory history of St. Domingo is prefixed, public papers and documents are reprinted as an

appendix, and thus a great book has grown out of a short and accidental visit. The map has merit: the other engravings demerit.

The introduction contains an analysis of the principal sources of intelligence consulted by the author. He calls the Abbé Raynal's work an able compilation: we think otherwise. The information it offers concerning the West Indies may be more trust-worthy than that concerning the East Indies; but he who asserts after the Abbé Raynal risks rashly; and he who enquires after him will usually find that much was narrated as true which is wholly invented and fictitious, that more was already known than his pretended diligence collected, and that his declamatory interferences are politically unwise. The Abbé Raynal's is, in the literary world, a dropt book: his intelligence is derivative, and his sources must all be reconsulted.

The first chapter of this history gives a succinct view of the fortunes of St. Do-

mingo or Hayti, from its discovery by Columbus in 1492 to its highest prosperity during the penultimate peace. The statistical is better executed than the historical information. A curious but inaccurate assertion occurs, that the food of the early inhabitants of St. Domingo has been the model of nourishment for the negro-slaves throughout the West Indies.

"The food of the early inhabitants of St. Domingo, appears to have comprised a similar description of vegetables to that of the negroes at this day: plantains, Indian wheat, millet, the cassavi root, potatoes, and Caribbee cabbage. Their quadrupeds included the smaller species of a lizard, yet the delicacy of a West India table; the Agouti rat, of which a description are yet found in some of the islands; and the alco, a small short-tailed dog, which did not bark, with others whose names have not come down to us. Their fishery was more abundant, every bay and creek furnishing an ample supply, as many of them do to the present time. The European quadrupeds now supply the necessary food of European colonists, with only such local additions as are objects of delicacy, or introduced by custom; among these may be named the land crab, the ortolan, and a variety of wild fowl of delicious taste and flavour. The indigenous vegetables yet remain, including plantains, yams, a species of spinach, potatoes, cassava, Indian wheat, and cabbage; to these are added the European roots, herbs, and pulse; and no want is found of cabbage, turnips, carrots, parsnips, peas, beans, artichokes, &c. A variety of fruits ornament the luxury of the table, among which the melon and pineapple, peaches and strawberries, oranges and lemons, the cashew, apples, pears, plums, and nuts, are plentifully combined with a variety of productions introduced from different countries."

The second chapter treats of the origin of the revolutionary spirit in St. Domingo. This is justly enough ascribed to the French revolution, to the discussions it occasioned, to the various elective assemblages of the inhabitants for sending deputies to the states-general, and to the society of the friends of the blacks; but above all, to the versatile legislation of the National Assembly, which left to each party the hope of the eventual aid of government. There is, however, a remoter cause, which may produce analogous effects elsewhere; the very large proportion of opulent and free people of colour, who enjoyed the advantages of education, and incurred the mortifications of exclusion. St. Domingo, being the oldest of all the European settlements in America, is naturally stocked with a larger share of creole

population: unless care had been taken to connect political privileges with property and not with skin, it was natural to find, at any opportunity of commotion, a common cause made against the white intruder first, and next against the slave-owner. We admire a bronze statue, no less than a statue of marble; it is a foolish prejudice of the eye not to know how to detect the forms of beauty, and the expressions of intellect, in living olive-coloured figures. Addison holds up his Cato as approving the addresses of the black Juba to his daughter; but such intermarriages have been too rarely encouraged by the European planters, to bring about a community of interest among those privileged classes, whose labour is not saleable by their employer.

The third chapter gives an account of the progress and accomplishment of the independence of St. Domingo. Much use is made of Mr. Edwards's excellent narrative. The following relation occurs of the capture of Port-au-Prince by the English, whom certain planters had invited over.

"The capture of Bizotton determined the fate of Port-au-Prince. The party remained in the fort till joined by the main body of the army from L'Arcahay, which, one part by land, and the other by sea, made its approach on the side next the rich plain of Cul de Sac. On the 4th of June they arrived within three miles of the town, and, at ten in the morning, the detachment of colonel Spencer marched to occupy a post on the heights behind the capital. When they had advanced about half way they were met by a mulatto woman, who acquainted them, to their surprise, with its evacuation. Colonel de Charmilly, with fifty of the colonial cavalry, were dispatched to ascertain the fact, which they found as she had stated; and they immediately took possession of the fort of the gate of Leogane. About half an hour after, a cry was heard from a cellar in a very concealed situation, and upon the door being broke open, a negro was discovered, surrounded by barrels of gunpowder. The unhappy wretch had been placed there, according to the opinion of M. de Charmilly, the preceding night, to blow them up at a certain time, but his match being extinguished, his own life, as well as that of those who surrounded him, were thus spared by mere accident.

"The fort De l'Hôpital was the next to be taken possession of, which was accomplished in the same manner, but with the appearances of imminent danger they escaped with their lives; for here the commissioners had planned their principal blow to destroy the new masters of the place, which had been defeated by the rain just mentioned. A train of powder

was found reaching from the magazine, (where several of the barrels had their bottoms knocked out, and the powder strewed about the floor,) to the thickets behind the fort; the whole, fortunately, was wet, and by precaution every accident was prevented.

"Fort Robin, in which were between two and three hundred men, who had refused to fly with the commissioners, readily surrendered to M. de Charnilly. The Baron de Montalembert was sent to take possession of Fort St. Joseph, which commanded the gate of the town leading to the Cul de Sac, and a detachment of troops from Leogane went to the Fort de St. Claire. Thus, in a few hours, the English were in full possession of Port-au-Prince. The commodore, who had entered the road, took possession of Fort de l'Islet, and sent in a British flag, which De Charnilly hoisted at Port Robin, with sensations that are easier to be felt than described. "I considered," says he, "this happy event as a recompence accorded me by fate for all my labours, and all my troubles in the salvation of St. Domingo." At six o'clock General Whyte arrived.

"Such was the capture of this important capital, whose character and wealth had tempted every person employed in the intended conquest of the island. Within the compass of its lines were one hundred and thirty-one pieces of cannon regularly mounted in batteries. In the harbour were twenty-two vessels laden with sugar, indigo, and coffee, of which thirteen were from three to five hundred tons burthen, besides seven thousand tons of shipping in ballast, in value amounting to 400,000*l*. A booty much more considerable was conveyed away by the commissioners, who loaded two hundred mules with their riches, and carried away near two thousand persons in their train. Having previously arranged their affairs, and finding the people of colour, (of whose aid they had only intended to avail themselves temporarily,) possessed of the whole natural strength of the island, under the mulatto Rigaud, and a negro named Toussaint L'Ouverture, they soon after quitted the colony, consigning immense wealth both to America and France, leaving General Laveaux in the character of commander in chief; and returned to France, where they received from the government presiding at that time a sanction of their proceeding. Polverel soon after died, the victim of a life of dissipation, but Santhonax lived to pay the colony a triumphal visit.

"Much controversy has existed on the idea of some private arrangement having taken place between them and the commodore, with whom several flags of truce passed during the three days in which the detachment from the army was kept inactive. How this was has never been explained, but from the situation of the road from Port-au-Prince to Jacmel, it is clear, that their retreat might have been interrupted, and, according to some, the fate of the colony determined. Immediately after

Port-au-Prince came into the possession of the British, more than three thousand armed inhabitants assembled in the town, ready to undertake any enterprize for the further reduction of the colony. Unfortunately, no use was made of the present advantages, but what they afforded in profit; thus an opportunity was lost, which, as is often the case, never occurred again.

"The capture of Port-au-Prince, so much desired, seems to have formed the height of British power in St. Domingo. "From that period the affairs of its possessions," says an old English officer employed on the spot, "began to decline in proportion, as it were, to the vast accumulation of expence; and all was languor, disease, or peculation." As soon as the general satisfaction gave way to the necessary consideration for defence, the soldiery were compelled to assist in raising intrenchments on the side of the town next the mountains by day, and to perform military duty at night, thereby suffering the effects, alternately, of the sun and the dew. Many of these men had been six months on ship-board, and the season was unfavourable to them. At this unfortunate juncture arrived the Experiment frigate, with the remainder of the troops ordered from the Windward Islands, under the command of the Honourable Lieutenant-colonel Lennox, consisting of eight flank companies belonging to the 22d, 23d, 25th, and 41st regiments. Now commenced in St. Domingo the ravages of that contagion, which, with a power more terrible than ordinary death itself, has bereft so many families of their hopes, and cut off the flower of a promising army, without the gratification of an honourable conflict."

This chapter and the ensuing one, or fourth, are more complete than the two first chapters; they throw a new and original light on many incidents and transactions, and offer important warnings to high communities. A good sketch is given of the state of manners resulting from the independence of the blacks; this is the most racy portion of the history; it is not repeated from the observations of other writers, but painted in a lively manner from personal inspection. The military exercises of the blacks are stated to resemble those of our rifle-corps, and to be performed with admirable skill and celerity. Subordination, or rather distinction of rank, is known only in the field; the drummer, the private, and the colonel, dine at the same ordinary, and take a new precedence by seniority, or by the accident of arrival. Those of the blacks, who have attained to prosperity during the revolution, as many have done by the salaries of office and the appropriation of spoil, live with a more than European

pomp and etiquette; they gladly employ mulatto servants. To the American merchants, who bring over what they want, they are hospitable and attached. Many Americans have settled among them, and have married rich women of colour. They have French plays: the mass of actors are negroes, but a few French players remain to instruct and to chieftain the rest. The negroes are very fond of the theatre, as well as of music and dancing, and billiards. They eat dogs. They practise polygamy. They labour less than before, but enough to provide for their simplified wants. The love of country and of independence is loud: no invader would have much chance of success. They venerate the memory of Polverel and Santhonax.

"The situation (says our traveller) of those who still remained in humble privacy, and who formed the great bulk of the people, was indeed very greatly changed. Their condition, agreeably to their capacities of enjoyment, approached nearer happiness than many others which are considered its ultimatum. Crimes were by no means frequent, and those rather attributable to accident than vice. They were perfectly at liberty as regarded themselves, and were more ready to perform their social duties, than the state was urgent in requiring them. Those qualities conspicuous in the negroes under their worst circumstances, their regard for all the relations of life, and tenderness to each other, seemed expanded with their freedom, and many of the little prejudices that had existed were away. Those amusements, which were formerly suppressed, had now free scope, but they restrained themselves from public annoyance with more regularity than could have been effected by the strictest police.

"The *menage* of the labourer of the town and its vicinity, was improved in a proportion equal to his condition. A rough, yet neat couch, supplied the place of the wretched bedding of a former period, and the visitor was not unprovided for, though it is lamentable to state, that in several instances the furniture of the cottage was beholden to the public commotions, and in one instance, painfully risible, a beautiful fire-screen, the dextrous workmanship of some fair sufferer, concealed a dog then roasting from some of their fellows, who considered it opprobrious to be *mangeurs des chiens*.

"In one instance, the writer was introduced by a brigand of peculiar intelligence, (with whom he had frequent conferences on the military tactics of the black army) to the cottage of a black labourer, of whom an account may not be uninteresting. He had a family of thirteen children; eight of them by one woman, and the remainder by two others; the former only lived with him in the same cottage, with his mother, who was aged and infirm; the other two, separately, at a small

distance. This man was an epitome of legislation, and his family a well regulated kingdom in miniature. His cottage consisted of three irregular apartments, the first of which was his refectory, where, as often as possible, and always on *jours de fêtes*, his subjects assembled, including on those occasions his three wives. The furniture of this apartment was entirely of his own making, even to the smallest utensil, and with an ingenuity beyond what might be expected from perfect leisure, notwithstanding the artificer, during the process, had been obliged to attend his labour in the fields, and was a considerable time in arms. On a neat shelf, appropriated peculiarly to their use, lay a mass book, and a mutilated volume of Volney's Travels, some parts of which he understood more than his visitor. Every thing convenience required was to be found on a small scale, and the whole so compact, and clean, with such an air of propriety throughout as was absolutely attractive. His own bed-room was furnished with an improved bedstead, supported by tressels, with a mattress and bedding of equal quality with the other furniture, but that of his children and mother surpassed the whole. One bedstead contained them, yet separated the male from the female, the young from the aged, and was separated or combined in an instant. The third was his kitchen and store-house, and might also be called his laboratory, for conveniences were found for chemical experiments, though not of the most scientific kind; but every utensil for culinary purposes were provided in the best manner. The wife of this labourer (for he had submitted to the ceremony of marriage with the female who had borne him the most children, as is the general custom with them) was nearly as ingenious as himself, and equally intelligent. The mode he pursued in the regulation of his domestic economy was excellent; as continence is not a virtue of the blacks, the increase of his family was not confined to his own house: yet, even in his amours he was just; and as the two mothers before-mentioned were less protected than his ostensible wife, the primary object of his consideration was to have the whole of his children under his own care. This was reconciled to all parties from the first, in so mild a way, that no distinction was perceivable but in age, while the mothers held a relationship to their domiciliated offspring similar to that of an aunt or cousin, each exerting herself for the purpose of adding to the comforts of her own child. On festive occasions, the two mothers sat alternately on the right or left of the mistress of the house, with as much etiquette as might be perceived in a more elevated station, and with the utmost harmony. The master of the family was absolute, but with him it was in theory, not in practice, for all seemed to vie in forbearance. As soon as the children could contribute their little powers to labour, they were employed; the younger (except as regarded their strength) being subject to the in-

and offices; and, singular as it may appear, on the few occasions alluded to, they waited upon their seniors, though but by a few years, and seemed delighted in the office. Agreeable to this rule, in accordance with that reverence for age so remarkable among blacks of every condition, the grandmother received the affection and attention of all; and though often crabbed, infirm, and discontented, no one seemed to consider her failings as such, but as a duty prescribed them to bear."

Some indiscretions of the author in returning ashore after his embarkation exposed him to the suspicion of being employed as an English spy. He was seized, imprisoned, in a fixed open cage, and was supplied during the night, through the bars of his grate, with fruits and refreshments, by the humanity of a woman of colour. A tribunal of black judges summoned and questioned him. Luckily his papers, which did contain some military plans and comments, were timely destroyed. The case was reported to Toussaint, who good-naturedly ordered the prisoner's release, accompanied with a gentle hint that he did not mistake the author for an American. The biography of Toussaint must not be passed over:

"Toussaint L'Ouverture was born a slave in the year 1745, on the estate of the Count de Noé, at a small distance from Cape François, in the northern province of St. Domingo, a spot since remarkable as the very source of revolution, and site of a camp, (that of Brech.) from whence its native general has issued mandates more powerful than those of any monarch on the earth.

"While tending his master's flocks, the genius of Toussaint began to expand itself, by an attention towards objects beyond the reach of his comprehension; and without any other opportunity than was equally possessed by those around him, who remained nearly in impenetrable ignorance, he learnt to read, write, and use figures. Encouraged by the progress he rapidly made in these arts, and fired with the prospect of higher attainments, he employed himself assiduously in the further cultivation of his talents. His acquirements, as is oftentimes the case, under such circumstances, excited the admiration of his fellow slaves, and fortunately attracted the attention of the attorney, or manager of the estate, M. Bayou de Libertas. This gentleman, with a discrimination honourable to his judgment, withdrew Toussaint from the labour of the fields, to his own house, and began the amelioration of his fortune, by appointing him his position, an enviable situation among slaves, for its profit, and comparative respectability.

"This instance of patronage by M. Bayou, impressed itself strongly on the susceptible mind of Toussaint. True genius and elevated sentiments are inseparable; the recollection of the most trivial action, kindly bestowed in obscurity, or under the pressure of adverse circumstances, warms the heart of sensibility, even in the hour of popular fervour, more than the proudest honours. This truth was exemplified by the subsequent gratitude of Toussaint towards his master. He continued to deserve and receive promotion, progressively, to offices of considerable consequence.

"Among other traits fondly preserved in St. Domingo of the conduct of Toussaint during the early period of his life, are his remarkable benevolence towards the brute creation, and an unconquerable patience. Of the former, many instances are related which evince a mind endued with every good quality. He knew how to avail himself so well of the sagacity of the horse, as to perform wonders with that animal, without those cruel methods used to extort from them the docility exhibited in Europe; he was frequently seen musing amongst the different cattle, seeming to hold a species of dumb converse, which they evidently understood, and produced in them undoubted marks of attention. They knew and manifested their acquaintance, whenever he appeared; and he has been frequently seen attending with the anxiety of a nurse any accident which had befallen them; the only instance in which he could be roused to irritation, was when a slave had revenged the punishment he received from his owner upon his harmless and unoffending cattle. Proverbial became his patience, inasmuch that it was a favourite amusement of the young and inconsiderate upon the same estate, to endeavour to provoke him by wanton tricks and affected malignity. But so perfectly he had regulated his temper, that he constantly answered with a meek smile, and accounted for their conduct by such means, as would render it strictly pardonable. To the law of self-preservation, or the misfortune of not knowing the delight of philanthropy, he would attribute an act of brutal selfishness; while he imputed to a momentary misapprehension, an inclination to rude and malicious controversy. Thus was his passive disposition never in the smallest degree affected, being ready on all occasions to conciliate and to bear, in circumstances whether frivolous or of the highest importance.

At the age of twenty-five Toussaint attached himself to a female of similar character to his own, and their union cemented by marriage, which does not appear to have been violated, conferred respectability on their offspring. Still he continued a slave; nor did the goodness of M. Bayou, although it extended to render him as happy as the state

of servitude would admit, ever contemplate the manumission of one who was to become a benefactor to him and his family. Such is the effect of ancient prejudice, in obscuring the highest excellence of our nature; he who would perform godlike actions without hesitation, from any other cause, shrinks from a breach of etiquette, or a violation of custom!

"In the comforts of a situation possessing a degree of opulence, Toussaint found leisure to extend the advantages of his early acquisitions, and by the acquaintance of some priests, who possessed little more of the character than the name, acquired the knowledge of new sources of information, and a relish for books of a superior order than first attracted his attention; the author of whom he became the most speedily enamoured, was the Abbé Raynal, on whose history and speculations in philosophy and politics he was intent for weeks together, and never quitted, but with an intention to return, with renewed and additional pleasure. A French translation of Epictetus for a time confined him to its doctrines, which he often quoted; but he soon sought higher food for his capacious mind, and found in a portion of the ancient historians, the summit of his wishes. He was there seen studiously consulting the opinion of those who teach the conduct of empires, or the management of war; yet, he neglected not those who aim to harmonize the mind, and teach man himself; the only difference in his habits imbibing these treasures created, was, an external polish, which imparted an uncommon grace to his manners.*

"Thus proceeded this illustrious man: like the simple acorn, first promiscuously scattered by the winds, in its slow but beauteous progress to the gigantic oak, spreading its foliage with august grandeur, above the minor growth of the forest, defending the humble shrub, and braving the fury of contending elements.

"Continuing on the estate on which he was born, when the deliberations preceding the actual rebellion of the slaves, were taking place upon the plantation of Noë, the opinion of him who was always regarded with esteem and admiration was solicited. His sanction was of importance, as he had a number of slaves under his command, and a general in-

fluence over his fellow negroes. Among the leaders of this terrible revolt were several of his friends, who he had deemed worthy to make his associates for mutual intelligence; yet, from whatever cause is not ascertained, he forbore in the first instance to join in the contest of liberty. It is probable that his manly heart revolted from cruelties attendant on the first burst of revenge in slaves about to retaliate their wrongs and sufferings on their owners. He saw that the innocent would suffer with the guilty; and that the effects of revolution regarded future, more than present justice. When the cloud charged with electric fluid becomes too ponderous, it selects not the brooding murderer on the barren heath, but bursts, perhaps, indiscriminately, in wasteful vengeance, o'er innocent flocks reposing in verdant fields.

"There were ties which connected Toussaint more strongly than the consideration of temporary circumstances. These were, gratitude for the benefits received from his master, and generosity to those who were about to fall,—not merely beneath the stroke of the assassin, for that relief from their sufferings was not to be allowed to all, but likewise the change of situations of luxury and splendour, to an exile of danger, contempt, and poverty, with all the miseries such a reverse can accumulate.

"Toussaint prepared for the emigration of M. Bayou de Libertas, as if he had only removed for his pleasure, to the American continent. He found means to embark produce that should form a useful provision for the future; procured his escape with his family, and contrived every plan for his convenience: nor did his care end here, for after M. Bayou's establishment in safety at Baltimore, in Maryland, he availed himself of every opportunity to supply any conceived deficiency, and, as he rose in circumstances, to render those of his protégé more qualified to his situation, and equal to that warm remembrance of the services he owed him, which would never expire.

Having provided for the safety of his master in the first instance, Toussaint no longer resisted the temptations to join the army of his country, which had (at this period) assumed a regular form.† He attached him-

* The following books were conspicuous in the library of Toussaint, a list of which was handed to the author in consequence of his enquiries respecting the progress of his mind:

Scriptores de re Militari.

Cæsar's Commentaries, French translation, by De Cresse.

Des Claisons's History of Alexander and Cæsar.

D Orleans History of Revolutions in England and Spain.

Marshal Saxe's Military Reveries.

Guisard's Military Memoirs of the Greeks and Romans.

Herodotus, History of the Wars of the Persians against the Greeks.

Le Beau's Memoirs of the Academy of Inscriptions and Belles Lettres.

Lloyd's Military and Political Memoirs; the Works of the English Socrates, Plutarch, Cornilius Nepos, &c. &c. &c.

† It is pleasing to reflect, that Toussaint was not the only instance of a similar conduct to the present. It occurred, with many variations, in numerous cases; an eminent instance of which will be found in the third chapter of this work.

self to the corps under the command of a courageous black chief, named Biassou, and was appointed next in command to him. Though possessed of striking abilities, the disposition of this general rendered him unfit for the situation which he held; his cruelty gained him to be deprived of a power which he abused. No one was found equally calculated to supply his place, with the new officer, Toussaint; therefore, quitting for ever a subordinate situation, he was appointed to the command of a division.

"If during this early part of his life, the black general had shone conspicuously, through every disadvantage, with the brightest talents and the milder virtues, he now rose superior to all around him, with the qualities and rank of an exalted chief. Every part of his conduct was marked by judgment and benevolence. By the blacks, who had raised him to the dignity he enjoyed, he was beloved with enthusiasm; and, by the public characters of other nations, with whom he had occasion to communicate, he was regarded with every mark of respect and esteem. General Laveaux called him "the negro, the Spartacus, foretold by Raynal, whose destiny it was to avenge the wrongs committed on his race;" and the Spanish Marquis d'Hermona declared, in the hyperbole of admiration, that "if the Supreme had descended on earth, he could not inhabit a heart more apparently good than that of Toussaint L'Ouverture."

"His powers of invention in the art of war, and domestic government, the wonder of those who surrounded, or opposed him, had not previously an opportunity for exhibition as at the period to which we have arrived in this history. Embarrassed by a variety of contending factions among the blacks, and by enemies of different nations and characters, he was too much occupied in evading the blows constantly meditated in different quarters, to find leisure for the display of that wisdom and magnanimity which he so eminently exercised. Nevertheless, a variety of incidents are recorded in the fleeting memorials of the day to corroborate the excellence of his character, and still more are impressed on the memory of all who have visited the scene of his government. Notwithstanding the absoluteness of military jurisdiction, which existed with extra power, no punishment ever took place without the anxious endeavours of the General-in-Chief to avoid it, exerted in every way that could be devised. No object was too mean for his remonstrance or advice; nor any crime too great to be subjected to the rules he had prescribed to himself. The punishment of the idle or immoral labourer was, being withdrawn from agriculture, and condemned to a military service dangerous or severe. In cases of treason he was peculiarly singular in his ideas, and the following incident will afford a specimen:—

"Shortly after general Maitland arrived upon the island, four Frenchmen were re-

taken who had deserted the black chief with aggravated treachery. Every one expected a vindictive punishment, and of course a cruel death. Leaving them, however, in suspense as to their fate, he ordered them to be produced in church on the following Sabbath, and, while that part of the service was pronouncing which respects mutual forgiveness, he went with them to the front of the altar, where, impressing them with the flagitiousness of their conduct, he ordered them to be discharged without farther punishment."

The anecdote is omitted that Toussaint was fond of theatric declamation, and especially of Saurin's Spartacus. As the third scene of the third act has had an obvious influence on his turn of sentiment, and may not lie within the reader's reach, we shall reprint it: the vein of sentiment is worthy of Corneille.

"Messala.—Esclave des Romains, permettez qu'on vous dise. . .

"Spartacus.—Leur esclave! Et quel droit me mit entre vos mains?

A quel titre, au berceau ravi par les Romains,

Le fils d'Argetorix a-t-il porté vos chaînes?

Rome m'opposera ses fureurs inhumaines:

Elle voudra s'en faire un titre révéré?

*Quoi! son ambition, à qui rien n'est sacré,
Traîne en de vils liens, le fils avec la mère,
Insulte la fille captive, en présence de son père,
Et prétend s'arroger un juste droit sur eux?
C'est le droit qu'un brigand a sur le malheureux,*

Dont il prend dans un bois la dépouille et la vie:

Mes fers sont un forfait qu'il faut que Rome expie.

*Eh, n'ai-je pas le droit d'en être le vengeur?
Il faut détruire enfin ce fléau destructeur,
Dont les dieux trop long-temps ont affligé la terre.*

Il est temps que mon bras, au défaut du tonnerre,

*Ecrase des tyrans, dont l'orgueil se croit né
Pour tenir à son char l'univers enchaîné.*

"Messala.—La force fonde, étend, et maintient un empire.

*Le droit de dominer, où chaque peuple aspire,
Des talens, du courage, est le prix glorieux:*

Et si de l'univers Rome fixant les yeux,

Passé les nations en talens, en courage;

Le droit de dominer est son juste partage.

*Tous ont même desir, mais non mêmes vertus;
La loi de l'univers, c'est malheur aux vaincus.*

"Spartacus.—Et malheur donc à Rome l'autrefois son esclave,

Aujourd'hui son vainqueur, j'ai le droit du plus brave.

*Ses titres aujourd'hui sont devenus les miens;
Puisque, de votre aveu, le succès fit les miens.
Qu'étoit Rome en effet? Qui furent vos ancêtres?*

Un vil ramas de serfs échappés à leurs maîtres,

De femmes et de biens, perfides ravisseurs ;
Rome, voilà quels sont les dignes fondateurs !
Laissez donc là mes fers, non pas que j'en
rougisse ;

La honte en est à vous, ainsi que l'injustice ;
La gloire en est à moi, qui de ce vil état,
Qui, du sein de l'opprobre, ai tiré mon éclat ;
Qui, votre esclave enfin, scut, créant une
année,

Me faire le vengeur de la terre opprimée.
Que Rome quitte donc cette vaine hauteur,
Qui lui sied mal sans doute, et devant son
vainqueur.

En barbares, sur-tout ; ne faites plus la guerre.
" *Messala*.—Mais vous-même de sang in-
ondant cette terre,

N'en avez vous versé qu'au milieu du combat ?
Tarente, abandonnée aux fureurs du soldat . . .

" *Spartacus*.—Malgré ma vigilance, il est
mille désordres,

Que n'ont pu prévenir ni mes soins, ni mes
ordres ;

Par un vil intérêt le soldat excité,
Au désir du butin, joint la ferocité.

Et ce sont ces cruels, ces âmes sanguinaires,
Des plus nobles projets, instrumens merce-
naires,

Qu'il faut faire servir au bonheur des humains.
Nous avons trop peut-être imité les Romains.
Mais, en plaignant l'abus, j'envisage les suites.
Eh ! quels sont en effet quelques cités dé-
truites,

Quelques champs ravagés ? si j'atteins à mon
but ;

Si, du monde opprimé, leur perte est le salut ;
Et si, des nations, par mon bras affranchies,
Les biens, les libertés, les honneurs, et les vies,
Ne sont plus le jouet de ces brigands titrés,
De tous ces proconsuls, à qui vous les livrez.

" *Messala*.—Votre projet est grand ; mais
souffrez qu'on vous dise,

Que le succès encore est loin de l'entreprise :
Plus d'un obstacle encore vous reste à sur-
monter ;

Et j'ose . . .
" *Spartacus*.—Il faut les vaincre, et non
pas les compter.

Tout projet, qui n'est pas un projet ordinaire,
Veut que l'on exécute, et non qu'on délibère.
J'ose tout espérer : les miracles sont faits
Pour qui veut fermement la mort, ou le
succès."

As some poets copy their characters from nature, so some natures copy their characters from the poet. The feeling and loftiness manifested on all occasions by Toussaint, seem to place him in this class. It appears, however, that one Pascal, a descendant says our author erroneously of the celebrated writer, an abbé Molière, and an Italian ecclesiastic named Marini, were among the literary coadjutors of Toussaint, and drew up his proclamations and constitutions of government. The Moses is oftener of essential importance than the Joshua of a revolution ; because he is less replaceable :

courage and command are more common gifts than intellect and acquirement. San Domingo the ecclesiastic committee of law-givers remains, and will, it may be hoped, guide Dessalines, and the successor of Dessalines, in the steps of the past Toussaint. Yet the civilizing influence of his personal virtues is irrepressible. This admirable hero has been treated Bonaparte in a manner at which one ought to shudder. The purest feelings of our nature were employed to decoy him into submission.

" Of a scene equal to the highest efforts of the drama, narration can give no semblance without using the language of passion so dangerous to truth. Enough, however, is learnt from the self-condemning account of the hero to prove, that it was of the most affecting nature. This wretch, with a heart cold as the cell in which he was bred, viewed the relations of this interesting family, only to the advantage of their situation. When the burst of joy and affection were over, and the hero turned to careen him, to whom he immediately owed the delight he had experienced, Coisson began his attack. " I saw them weep," says he, " and, wishing to take advantage of a period which I conceived to be favourable, I stopped him at the moment when he stretched out his arms to me ;" he recapitulated the letters of Bonaparte and Clérr, and invited him to accede to them. He painted the intentions of France towards the island in the most fascinating language ; he scribed the advantages of resuming its relations with the mother country ; and declared, with the utmost solemnity, that it was not the intention to interfere with the liberty of the blacks ; concluding with a wound that struck to the heart of Toussaint ;—his orders to turn with his charge to the Cape immediately if he did not consent. The wife of Toussaint recovered from the convulsive joy with which she was seized, commenced solicitations of a milder kind, and, notwithstanding the rebuff by a frown, from that face which had beamed with tenderness upon her, continued to urge the advantages with which she was impressed. The unconscious children scribed the happiness in which they had been nurtured, and the hero seemed to be assailed by opposing solicitations so tender, when a well-practised tutor again assailed him, becoming less cautious, hinted at his immediate junction with the Captain-General Toussaint, now confirmed in his suspicion, instantly retired from the view of his wife and children, and when Coisson expected, to his infernal pleasure, his fraudulent victory, him this dignified determination. " I will back my children, if it must be so, I will be faithful to my brethren and my God !" The characters of father and hero could not be in this trying situation. Toussaint did not see another sight of his children, but in less than two hours from the moment of his arrival,

ported again for the camp, from whence he returned a formal answer to the letter of General Le Clerc. This circumstance appears to have developed in a clearer view the intentions of the invaders, and is an explanation of the marked hostility in the onset, although supposed to be only intended to re-establish the colonial relation of the island to France. The answer was conveyed by Granville, the son of the younger sons of Toussaint, a richman; and a correspondence was commenced with the same demands on the one part, and an evasion of satisfactory explanation on the other."

The calling in of the domestic affections, as means of influencing public conduct, has in it much of the barbarian; and calls the infancy of society, when the grown up Coriolanus was brought to order his mania. Where such means are in vogue, one part of heroism must be placed in overcoming the private attachments. But proceedings, which imply in those who recur to them a total want of the finest sensibilities of our nature, ought to be held, like the use of poisoned weapons in war, or of the torture in jurisprudence, deeply, indelibly disgraceful, not only to those who actually engage in them, but to the nations which employ for their public agents those who engage in them. Manœuvres, less unpalatable because more conformable to the routine of political villainy, at length hatched from Toussaint his most active supporters, and furnished the means of apprehending his person, and of sending him to France, where he died in custody in a non-descript manner.

The yellow fever having thinned the ranks of Le Clerc, a war with England was recommenced which lessened the force of recruits from France, the dissensions of the blacks with every form of domination having broken out afresh, passions resumed the assertion of a glorious independence. It may endure, if so, it will rebarbarize the island. The heedless extravagance of the black people, and the dislike of industry among their followers, must speedily create a scarcity of all the productions of interdependence. Some taste for the luxuries of Europe will remain; and at last perhaps African practice will be resorted to, of dragging into slavery the superfluous population, in order to obtain iron utensils and distilled liquors. Thus a new and rigorous mart of slaves may be founded in the West Indian Archipelago, by the means resorted to for abolishing

The usual effect of violence is to defer its gratification. The revolt of the helots during the earthquake of Laconia, terminated in changing their bonds into fetters. The revolt of the Italian slaves under Spartacus delayed, by intimidating the masters, an alleviation of their condition. Industry begets property; property, justice; and justice, freedom. Whenever the natural process is interrupted, by calling in force, the entire progress must begin anew. Security will first be re-established, and concession be made the recompence of a penitent and experienced submission. The inhabitants of San Domingo are more likely to owe independence than liberty, to the negro army. The fee-simple of the confiscated and plundered estates may by degrees pass over to the American merchants; and a maroon gypsy-like population of ownerless negroes may live in idle savagism among the mountains; but the proprietors, whoever they are to be, will at last purchase the alliance of the public force, and introduce the cheapest method of cultivation.

Agricultural communities suffer more and oftener than commercial ones from the insurrection of journeymen. By throwing open the ports of the West Indies to American commerce, a further settlement of the trading classes would be attracted to the island sea-ports. A direct trade with the East Indies would be a more advantageous measure, and a means of gradually transferring many articles of cultivation, and many arts of life, from the Asiatic to the American world, together with a mass of free labourers, accustomed to tropical industry. Thus a middle order of people might be domesticated in our West Indian islands, whose presence would defend the planters against rebellion, and the vassals against ill usage. The consumption of our domestic manufactures would be much greater; for one white, or one free mulatto, consumes three times as much apparel as the half-naked negro, not to reckon his other less certain wants, which increase with his prosperity. And a provision would be made for the easy obtainal and gentle substitution of hired labour, during the accidental or local revolts of the negroes, during the pressure of seasons or the arrival of fleets, and during a dearth of the Africans.

Sir George Leith's history of Pulo-penang shows how very rapidly all our new colonial establishments could be pro-

vided with inhabitants, if they were but open to the reception of the superfluous population of our Asiatic possessions. Not only Trinidad and Bulama might be at once stocked with men; but the island of Marayo, which ought also to be seized, and which is better situate for internal trade with the South-American continent

than Trinidad, would without difficulty be supplied with elemental settlers. what use is it to possess both the east and the west, unless we render them conducive to one another's well-being? We serve our colonies, inasmuch as we leave them in trust for the benefit of the world.

ART. V.—*The History of the public Revenue of the British Empire. Containing an account of the public Income and Expenditure from the remotest Periods recorded in History, to Michaelmas 1802, with an Account of the Revenue of Scotland and Ireland, and an Analysis of the Sources of public Revenue in general. By Sir JOHN SINCLAIR, Baronet, M. P. Vol. III.*

THE two former volumes of the work before us preceded the commencement of our literary annals. This begins with an analysis of the British national debt, as it stood in 1804, and computes its capital amount at 337,660,465*l.* and its yearly interest at 22,877,954*l.* By this time, no doubt, half a million each week is put in circulation by the issue for interest merely. We agree with sir John Sinclair in thinking that this is not an alarming sum. The credit of an individual is always sufficient to borrow up to the whole amount of his fixed property: and the credit of a nation, if taxes were always laid on the rental of fixed property, would nearly suffice to the same extent.

The second chapter treats of the revenue of Scotland, and the third of that of Ireland. A more interesting speculation is contained in the fourth chapter, which treats of the national resources.

Sir John Sinclair enumerates frugality first. This is Ciceronian rant. *Optimum, et in privatis familiis et in republica, rectigal est parsimonia.* Sober philosophy will put less confidence in retrenchment. We seek in vain for the historical instance of a revenue permanently invigorated by mere parsimony. Sully, it is boasted, was a niggard to the beggarly courtiers, and, without new taxes, wound up an insignificant revenue to five times its original amount. But he took in hand a country desolated by civil war, at the low produce of anarchy, and by buying in cheap the doubtful claims on the state, and by extending the collection of the taxes over the whole surface of France, he might well work the apparent miracle of paying in ten years two hundred millions of debt, and increasing the public income from thirty to one hundred and fifty millions. The case of Great Britain is diametrically opposite. Here we have already the alert collection of a strong go-

vernment busily going on. The country is hollow-drained with revenue, and every drop of profit, that uses the bounty of nature or the pressure of labour, from the heavens above or the earth beneath, is presently gathered into the main trunk, and absorbed in the pool of the treasury. Courageous men would hazard so much allegiance as to endanger tranquillity. Our pens are either the recompence of public service, which it were unjust to withdraw; or wages of corrupt obedience, which is unsafe to dispense with. Suppose public faith broken with all those powers, who have been quartered on the national treasury, not for public service for the private services, the corrupt, the abused influence of their hirelings; could half a million a year, a single week's expenditure, be so minimized? And is nothing to be feared from the tongues, the pens, or the weapons of a gang of court parasites turned to starve? In times like these, when conspiracies are among the amusements of genteel life, it is cheaper for the state to have too many guests than too few besiegers. Suppose a better system of book-keeping introduced in all the offices; and that every receipt and every bill were posted by double entry with the bidexter formality of an Italian book-keeper, and that every account was not only kept clearly and accessibly, but printed: would the new army of cost much less than the old army of bezzlers? Yet this reform, as it would increase the patronage of government, the expence of unfair hangers-on, is not enough to be realized. *Frugalitas est rumoris boni*, said Laberius, and has usually proved in ministers of state. Necker expected by simple frugality to meet the deficiency in the French finances; a more courageous taxation

priety, would have saved the public credit. We admit generally the expediency and duty of frugality; but we do not rate it high as a resource: like a sumford kitchen, what it saves in coals it spends in machinery; and varies the form of waste without much affecting its amount.

Sir John Sinclair has especially censured (p. 216) the extravagance of the finance-department, an extravagance the more unpardonable, as our artillery is not on a capital footing. Among the sound plans suggested by him for the improvement of the revenue, we class a commutation of the duty on coal carried coastwards, for an excise-duty on coal to be levied by weight at the mouth of the pit: and also the following comments on ecclesiastical income:

"Of all the corporations that exist in this country, none can be compared in point of dignity, importance, or wealth, with the church of England, including the various seminaries in the universities of Oxford and Cambridge, which are so intimately connected with it.

"Many friends to ecclesiastical reformation have contended, that a complete alteration of the present system is necessary; that the hierarchy ought to be totally abolished, and its property vested in the public; and that either a national church ought to be established, on the presbyterian model, being the least expensive; or, that the clergy should be entirely dependent on the voluntary contributions of the people. But in every plan so important a nature, extremes ought to be avoided; and a prudent man, who would not probably give his voice in favour of the hierarchy, were it now for the first time to be proposed, instead of rashly altering ancient institutions to which a nation has been accustomed, would rather endeavour to make the present church establishment of as much public service as possible, by compelling the clergy to reside more in their respective parishes; and, in some cases, by imposing additional taxes upon the income they possess.

"It has already been remarked, in a former part of this work, that prior to the restoration, or at least to the establishment of the commonwealth, the clergy taxed themselves, and frequently paid two shillings in the pound

more than their lay brethren. Without extending such a regulation to the whole church, it might surely be adopted so far as respects some particular classes.

There is no tax that has been more generally approved of, than that which imposed a certain duty upon the different sinecure offices of the state; and it has been well urged, that since those who are employed in the service of government, must submit to the reduction of their salaries, why should not the dignified clergy, who enjoy many valuable places, with very little trouble attending them, be considered in the same light, and be made subject to the same law, particularly as the offices held by deans, residentiaries, canons, prebendaries, precentors, treasurers of cathedrals, masters of colleges, &c. have this advantage over many of the civil offices, that they are enjoyed for life, and that the holders cannot possibly be deprived of them by any thing short of legislative authority.†

"Those who enjoy a plurality of livings, ought also to be liable to an additional tax of two shillings in the pound. However vehemently such accumulations may be defended,‡ they are equally contrary to the genuine principles of ecclesiastical polity, and to the soundest doctrines of the christian religion. When once the extent of a parochial district is ascertained, if it furnishes a sum adequate to the maintenance of a pastor, the inhabitants of the district are entitled to have a clergyman residing among them, to inculcate the principles of religion, and to edify them by his example; and if a plurality of livings is at all to be permitted, such as are suffered to enjoy so considerable an advantage ought to pay a duty to the public for the privilege they possess.

"Heavy taxes ought also to be laid upon non-resident clergymen, whether pluralists or otherwise, who do not fulfil the object of their appointment.§ The ignorance and prodigality of the lower ranks in England are, perhaps with some justice, attributed to the inattention of their pastors. It cannot be expected that those who are abandoned by their natural instructors, and left to the guidance of their own impetuous passions, should always act as becomes the professors of the christian religion. And it is of little consequence, that a wretched curate is left, with a pitiful salary, to conn over the lessons of the day, or to preach a cold and lifeless sermon upon Sunday, whilst his proud superior is amusing himself in the capital, or wandering

* It need hardly be remarked that the property of the church is subject to the present land tax in common with the rest of the kingdom.

† See Considerations on a new Place-tax, printed anno 1756:

Mr. Wharton, in his Defence of Pluralities, as now practised in the Church of England, printed anno 1703, has attempted to defend the holding of two benefices at the same time; but his principal argument is, that pluralists are not more useless in their profession than non-residing clergymen; which cannot have much weight with any body, and far less with those who think that all clergymen should be residents.

‡ Perhaps the tax should also be extended to those who present themselves, and who consider the livings in their gift in the same manner as an hereditary estate.

from one meeting-place to another, in search of pleasure and procreancy.

"But it is a tedious diagnosis of impotence to carry these principles into effect, yet surely the clergy ought no longer to be suffered to engross any part of the national income. In the reign of Queen Anne, a popular cry was raised in favour of the church, of which a party in opposition took advantage to overturn the administration of the day; and, in recompence thereof, an act was passed, by the instance of the new ministers, in consequence of which the first fruits and tenths, a part of the revenue of the crown, were taken from the public, and appropriated to the augmentation of the smaller clerical benefices. This branch of the revenue amounted to about £14000 per annum; and on the first of January 1735, the governors of that charity possessed besides, from savings and private benefactions, the sum of £152,500 of Old South Sea Annuities, and £4,957 : 2 : 11, of cash in the hands of their treasurer.* Whatever the state of that fund may now be, yet surely, if the small livings of the church required to be augmented, it is not from the revenue belonging to the crown, and to the public, but from the church itself, where its emoluments are confessedly too great, that the addition ought to be demanded."

A third project, more practicable than praise-worthy, is the hide-tax recommended at page 257. The tax on leather already subsisting is too heavy, and compels poor children to go unshod; this practice brings on diseases of the foot and ankles, and disablement for military service. We should prefer a total repeal of the tax on leather to any additional assessment; and we presume that much more leather could be exported from this country, if hides both came and stayed free of duty.

- Another important hint is thrown out in the following passage:

"When the revenue arising from the first fruits and tenths, was originally appropriated

for ecclesiastical uses, various means were adopted that might in the private advice to devote some part of their industry to purpose; and it is an important circumstance to mention, that in the space of about fifty years and a half commencing anno 1714, less a sum than £15,0000, was appropriated to different persons for augmenting small livings in England.† That was at the rate of about 10,000l. per annum; and such a sum upon a 4 per cent. stock, would have paid the space of a hundred years the sum 12,500,000l.

"But it is not the church alone that has been benefited by such extractions. It is hardly a town in Great Britain of any considerable importance; there is not a good foundation of any kind; nay, hardly a parish in England, to which some benefactions have not been made, which, were they accumulated to one sum for any particular object, would be productive of astonishing effects. The charitable donations for the relief of the poor, in England and Wales alone, exceed 250,000l. per annum. If that sum, operating upon a 4 per cent. stock, would have accumulated, in the space of a century, to the amount of 300,000,000l. and consequently our debt, if it were as great, might have been actually discharged before this time, by voluntary contributions had such a system been properly understood and encouraged at the revocation.

"Nay, the particular idea above hinted has not been neglected. Anno 1733, Richard Norton, Esq. of Southwick, in the neighbourhood of Portsmouth, left his property and estates to parliament to pay the public debts;‡ Sir Joseph Jekyl, master of the mint in the reign of George II. who died anno 1738, bequeathed effects to the amount of about 26,000l. to the sinking fund.§ parliament was afterwards prevailed upon to reverse the will of that public-spirited citizen, yet that very sum would have bought, in the space of forty-five years, the sum of 103,000,000l. of 4 per cent. stock; and at the conclusion of a century sir Joseph Jekyl would have been recorded as a benefactor to the public to the amount of 1,255,000l. Such a sum

* See Lords' Journals, vol. xxiv. p. 665. The return was printed anno 1736, in one volume folio.

† See Ecton's Liber Valorum, third edition, printed anno 1728.

‡ Paterson's Description of the Roads of Great Britain, p. 17. Road from London to Portsmouth. It is said, that the will was set aside. A copy may be seen in the Gentleman's Magazine. Vol. iii. p. 57. (February 1733.)

§ The history of Sir Joseph Jekyl's legacy was as follows: By his will, dated the 4th of May 1738, he left 10,000l. East India stock, and 10,000l. South Sea stock, to be applied, after the death of Elizabeth his wife, to the use of the sinking fund, in such manner as should be directed by act of parliament. His widow died anno 1745; and the East India stock was sold anno 1747, for 15,872l. : 14; and as the South Sea stock was then about par, the whole legacy amounted to about 26,000l. By 20 Geo. III. cap. 34. £13,582 : 9 : 2 in money, was given from the sinking fund to the residuary legatees. By an act passed anno 1772, (12 Geo. III. cap. 53.) the sum of £2,290 : 4 : 10 of this legacy was directed to be paid into the exchequer, to be applied to the sinking fund. This was the only advantage reaped by the public from this particular legacy. By 14 Geo. III. cap. 89. the balance of his legacy was given to his heirs.

It has been encouraged, would have soon met. The author of this work, having discussed among his friends, a small tract recommending such an idea, was happy to find it met with the warmest approbation; some by whom it was perused, expressed the strongest anxiety, that the necessary laws for that purpose might be enacted without delay, that they might have an opportunity of doing, how sincerely desirous they were, of doing the interests, by voluntarily consenting to diminish the heavy burdens, to which their fellow-citizens were subject.

As a strong and useful incitement to such beneficent actions, it might be enacted, that any sum thus given, should be accumulated and compound interest in the name of the donor, and the politic regulation that was desired in regard to the augmentation of the livings of the clergy, ought to be acted, by which a sum equal to the money borrowed, should be taken from the general fund, and appropriated to the same purpose. The consequences of such a regulation may be easily supposed from this, that there is only a citizen in this country, who by great industry and minute attention might not accumulate 1000*l.* in the space of a few years. If that sum were laid out in 4 per cent. stock, in the course of a century it would purchase 20,000*l.* of stock; and if an equal sum were taken from the sinking fund, at the end of a hundred years he would appear a benefactor to the state to the amount of half a million, at the conclusion of which period a statue should be erected to his memory in Westminster-abbey, or some other conspicuous edifice, as a mark of the public gratitude. Thus might a private individual, acquire immortal honour, by means perfectly practicable and easy."

The sale of the crown-lands is advised with convincing arguments at page 294. Some reserve of timber-ground for naval supply has been pleaded for; but we believe that private interest and private luxury will always provide the requisite stores. Besides, if ship-building should become too dear, the laws which privilege British-built ships can be repealed. Some scanty hints occur at page 303 concerning the availability of our East Indian conquests. Local loans might there be made, funded, and provided for.

Among the papers included in sir John Sinclair's appendix may be distinguished the first, entitled an analysis of the sources of public revenue. It compiles a vast mass of fact and reference concerning taxation in different ages and countries; and marshals in convenient arrangement the various forms of tribute. One of the less complete chapters is the third, which treats of public revenue from buildings,

without noticing those rent-taxes by which our poor's-rate is assessed, or those window-taxes and hearth-monies, which are so conspicuous in the catalogue of our burdens: both these are taxes on buildings. Edifices form a very productive and a very expedient source of revenue: their utility to the country is not at all diminished by any tax, however heavy on the rental: only their capital value, their selling price, is affected, which facilitates transfer. It would be expedient to window-tax places of worship and empty houses; this would prompt a demolition of deserted and superfluous buildings, and accelerate the reduction of rents, when the country is overstocked with shelter.

In a section of the second chapter of the third book of this meritorious analysis, (which ought to have been published apart as a separate work, for it has no connexion with the history of the revenue) sir John Sinclair lays down the axiom that 'taxes ought to be in proportion to the property which each individual possesses.' This appears to us paradoxical. Property usefully employed ought never to be driven from its destination by the persecutions of the tax-gatherer. Property mischievously employed ought to be driven from its destination by the inroads of the tax-gatherer. The purest title to property, as Mr. Burke observes, is the wise employment; and this is the title which the taxer ought to respect. He is not to burden equal property equally in the hands of idleness and of industry. The idler, who lives a useless life, on the rent of his acres, houses, bonds and funds, ought to pay more in proportion, than the farmer, manufacturer, or trader, who renders these lands, or buildings, or capitals, productive. The fatigued labourer must not be blooded so often as the pampered feaster; nor ought the political physician to amerce alike the earnings of industry and the squanderings of luxury.

A second appendix enumerates the various books extant on the subject of finance in our language: we wish it had been a critical catalogue; and that those works had been shortly characterized, which it is worth while to read or to reprint.

This copious history of the revenue abounds with curious details; it displays an enviable command of library and a meritorious range of research; but it has not all the compression of materials, the neatness of redaction, the systematic distribution and proportion, which an artist bookmaker has strived to

attain. The instruction bestowed is various and important, but desultory and diffuse : it wanders, like a bank-note, from the merchant to the land-owner, from England to Ireland, from the excise-office to the treasury.

Sir John Sinclair displays much industry and much talent ; he excels perhaps more in compilation of fact than in felicity

of inference, in antiquarian than in critical investigation, and is rather the statistic than the statesman. Yet he has this of greatness, that his object is utility not display ; that he is exempt from servility to party or to power ; and that he offers up his toil and his wisdom to the public service with the unreserve of patriotism and the calmness of disinterest.

ART. VI.—*The Roman History, from the Foundation of Rome to the Subversion of the Eastern Empire, and the Taking of Constantinople by the Turks, in the Year of our Saviour 1453 ; including the Antiquities, Manners, and Customs, as well as the Jurisprudence and Military Establishment of the Romans. In Seven Books. On a new and interesting Plan. By the Rev. JOHN ADAMS, A. M. ; Author of the History of Great Britain, and other much approved Publications.* 8vo.

THERE is a good book on Roman antiquities by Alexander Adam of Edinburgh : this John Adams is not a writer of equal learning, research, a condensation : but he has performed with convenient propriety and less ambitious task ; and has abridged for the use of schools and of young people, into an inconsiderable volume, the whole Roman history down to the taking of Constantinople.

The earlier portions of the narrative are more completely given than the later. We should have preferred a severer condensation of the first book. The current fables concerning the Roman origins must be learned, because they are often alluded to : but it was not necessary to dilate so much on the marvellous anecdotes of the primeval kings and champions.

The first historians of Rome were poets. Ennius wrote metrical annals of the kings ; and Nævius a metrical chronicle of the first Punic war ; but the former of these two bards could have no authentic sources of intelligence ; he did not, like Nævius, relate events of which he was a great part. Romulus and Remus, Numa and Egeria, class with the kings and nymphs of the Polyæpion.

The priesthood are stated annually to have written on a white board, which was exposed to the inspection of the few who could read, a short register of the magistrates and events of the year. These agreed notices of public occurrences were afterwards transcribed and preserved in the archives, and are quoted as the funda-

mental documents of Roman history. Now these archives down to the year 390 perished totally during the conflagration of Rome by the Gauls. Fasti, and other collections of precedents for laws and public rites, were afterwards compiled, and ascribed to the traditional fathers of the country ; but there is no trust-worthy history before Camillus.

Yet this portion of history fills ten chapters of the volume before us ; whereas the whole period from 476 to 1453, occupies but nine chapters.

The archæological matter concerning the arts, manners, games, coins, religion, and constitution of heathen Rome, is too extensive for a work professedly historical. On the contrary, there is a deficiency of geographical matter : without a map of the Roman world, containing the ancient names of places, it is not easy for young people to follow an annalist of their affairs.

The mention of those moderns, who flourished before the taking of Constantinople by the Turks, might have been forborne. A long catalogue of names occurs from page 249 to page 256, which have nothing to do with Roman history ; they must be leaves of some other work sown in by mistake.

We have no doubt this book will be found sufficiently useful to invite a second edition, when we trust a more proportionate distribution of materials will be attained.

ART. VII.—*Observations on the Present State of the Highlands of Scotland, with a View of the Causes and probable Consequences of Emigration.* By the EARL OF SELKIRK. 8vo. pp. 224.

THE chief cause of prosperity among the numerous classes in Great Britain is that spirit of emigration, which happily

is a national affection. There is no country in which so large a proportion of the people have travelled : none, in which so

many are constantly employed in migratory occupations, as carriers, drivers, wherry-men, and sailors: none, in which the tombs of the natives are so distant from their cradles. To die rich, or to die abroad, is the avowed system of commercial enterprise. Discontent with every situation which can be bettered is the meritorious profession of all ranks. A lubber, a stay-at-home, is with us a term of abuse. This is rational. He who expatriates himself confers a benefit on his remaining fellow-citizens: he bequeaths while alive to another the form of subsistence in which he was engaged; he contributes to cheapen food and to raise the wages of labour, by withdrawing competition, and thus to facilitate at home early marriage and the consequent purity of domestic morals. His industry, wherever it is employed, will be exchanged for some of the productions of his mother-country, whose manufactures are sure to profit by his consumption during absence. If eminently prosperous, he will return at last, and bring back the glorious recompence of his industry; if but ordinarily successful, he will have still contributed to make the commerce, the language, and the power of Great Britain pervade the distant provinces.

A society for the encouragement of emigration should be founded. It should keep lists of poor families willing to be exported, and of the districts to which they would contentedly be carried. When a sufficient cargo is ready for Botany-bay, or Pulo Penang; for the Cape, or Bulama; for Trinidad, or Upper Canada; let the requisite arrangements be taken by the society to secure a proper reception, and to convey gratuitously the colonists. The expence of crossing the sea is the chief impediment to the speedy population of the British settlements. Many persons, especially from Wales and Ireland, in order to conquer this difficulty, sell themselves for a given term of years to the American captains at Liverpool, and are resold to the highest bidder on their arrival at Baltimore, or New York. This white-slave trade is carried on under the forms of the laws concerning apprentices: and there is reason to believe that, by successive advances of money or necessities to the bondsmen, such prolongations of his slavery, beyond the seven years of the original agreement, are brought to bear, as entirely assimilate the condition of the British emigrant, in the pretendedly free states of North-America, to that of a Ro-

man citizen sold into perpetual slavery by a harsh creditor. It would be an act of humanity, as well as of patriotism, to warn these rash rovers against contracts so oppressive and tyrannical; and to facilitate their landing in *freedom* on territories not less likely to offer an easy maintenance than the provinces of the United States. During peace, a proper employment for the ships of government would be to carry out passengers freight-free, in all directions, to the British settlements; during war, the superfluous population naturally finds another course.

Among the persons to whom a society for the encouragement of emigration would eagerly allot its honorary medals is the present earl of Selkirk. He visited Canada; he fixed on a spot in Prince Edward's Island as the field of colonization; he provided ships, stores, medical attendance, instruments of labour; he superintended the allotment of the lands, and in a single year established a considerable community, independent of external or foreign aid for subsistence and shelter. To Cecilius lord Baltimore, the founder of the prosperity of Maryland, the grandchildren of his patronage justly ascribe a high rank among the benefactors of society, and the worthies of the human race. The future islanders of Prince Edward's land, will preserve a similar gratitude for the memory of the earl of Selkirk. His narrative is simple, interesting, instructive.

"This island of Prince Edward is situated in lat. 46° and 47° in the Gulph of St. Lawrence, near the coast of Nova Scotia—it is about 120 miles long, and much intersected by arms of the sea, along which is a thinly scattered population, estimated at about 7 or 8000. The lands of this island were granted in the year 1767, in several large lots, of which a great proportion fell into the hands of persons who have entirely neglected their improvement, and in consequence of this many very extensive tracts are totally uninhabited. The settlement I had in view was to be fixed in one of these, where, for upwards of thirty miles along the coast, there was not a single habitation. The spot selected for the principal establishment was separated by an arm of the sea, and an interval of several miles, from any older settlement. Those that were in the vicinity were of inconsiderable amount, and little benefit was derived from any intercourse with them; so that the emigrants who arrived on this occasion were placed in circumstances scarcely more favourable than if the island had been completely desert.

"These people, amounting to about eight hundred persons of all ages, reached the island

in three ships, on the 7th, 9th, and 27th of August 1803. It had been my intention to come to the island some time before any of the settlers, in order that every requisite preparation might be made. In this, however, a number of untoward circumstances concurred to disappoint me; and on my arrival at the capital of the island, I learned that the ship of most importance had just arrived, and the passengers were landing at a place previously appointed for the purpose.

"I lost no time in proceeding to the spot, where I found that the people had already lodged themselves in temporary wigwams, constructed after the fashion of the Indians, by setting up a number of poles in a conical form, tied together at top, and covered with boughs of trees. Those of the spruce fir were preferred, and, when disposed in regular layers of sufficient thickness, formed a very substantial thatch, giving a shelter not inferior to that of a tent.

"The settlers had spread themselves along the shore for the distance of about half a mile, upon the site of an old French village, which had been destroyed and abandoned after the capture of the island by the British in 1758. The land, which had formerly been cleared of wood, was overgrown again with thickets of young trees, interspersed with grassy glades. These open spots, though of inconsiderable extent with a view to cultivation, afforded a convenient situation for the encampment: indeed the only convenient place that could have been found, for all the rest of the coast was covered with thick wood, to the very edge of the water.

"I arrived at the place late in the evening, and it had then a very striking appearance. Each family had kindled a large fire near their wigwam, and round these were assembled groups of figures, whose peculiar national dress added to the singularity of the surrounding scene. Confused heaps of baggage were every where piled together beside their wild habitations; and by the number of fires the whole woods were illuminated. At the end of this line of encampment I pitched my own tent, and was surrounded in the morning by a numerous assemblage of people, whose behaviour indicated that they looked to nothing less than a restoration of the happy days of Clanship.

"After our first meeting, I had to occupy myself in examining the lands, and laying them out in small lots for the settlers. In this business I soon began to feel the inconvenience of not having arrived at the time I had intended. The plans which had formerly been made of the land, were too inaccurate to be of much use: a new survey could not be completed sufficiently soon; but some measurements were indispensable; and even this little took up time that could ill be spared. From this cause, combined with some of those errors from which a first experiment is rarely exempt, it happened that three or four weeks elapsed before the settlers could have their in-

dividual allotments pointed out to them; and during all this time they were under the necessity of remaining in their first encampment.

"These hardy people thought little of the inconvenience they felt from the slightness of the shelter they had put up for themselves; but in other respects the delay was of very pernicious tendency. There are few parts of America where there are not people ready to practise on the ignorance of new-comers, and by representations, true or false, to entice them to fix on some place where the officious adviser has an interest to promote. Some attempts of this kind were made, and, though not ultimately successful, gave much trouble. The confidence of the settlers seemed to be shaken; and from their absolute ignorance of the country, argument had no effect in removing any unreasonable fancy. The terms upon which lands were offered to them were scarcely equivalent to one half of the current rate of the island; yet they acceded to them with much hesitation, and a long time elapsed before they became sensible of the uncommon degree of favour they had experienced.

"At one period, indeed, there seemed to be a probability of the settlement breaking up entirely. As long as the people remained together in their encampment, they partook in some degree of the versatility of a mob. It was not till they had dispersed to their separate lots, till by working upon them they had begun to form a local attachment, and to view their property with a sort of paternal fondness, that I could reckon the settlement as fairly begun.

"In this interval an alarming contagious fever broke out, and gave no small degree of anxiety, by its progress among the settlers. My apprehensions, however, were relieved by the presence and assistance of a medical gentleman, whom I was fortunate enough to have as my companion, and whose professional skill was equalled only by his amiable and humane attention to every class of patients. Through his assiduous and unremitting exertions, the disease was soon alleviated; and few fatal cases occurred. There were not many of the settlers, however, that escaped the contagion altogether: it was difficult to intercept it among people living in such close vicinity, and in a continual intercourse, which no means could be found for preventing. This fever had been occasioned by some accidental importation, and certainly not by the climate, which is remarkably healthy. The disease was nearly eradicated, when the people began to disperse to their separate lots, upon which they had all begun to work before the middle of September.

"I could not but regret the time which had been lost; but I had satisfaction in reflecting, that the settlers had begun the cultivation of their farms, with their little capitals unimpaired. The principal expence they had to incur was for provisions to support them

during the winter and ensuing season; besides which, all the more opulent purchased *mitch* cows, and some other cattle.

"Provisions, adequate to the whole demand, were purchased by an agent; he procured some cattle for beef in distant parts of the island, and also a large quantity of potatoes, which were brought by water carriage into the centre of the settlement; and each family received their share within a short distance of their own residence. Some difficulties occurred, indeed, in procuring a full supply; for, though the crops of the island afforded a great super-abundance, most of the farmers who could spare any considerable quantity, had taken up the idea, that, from so large an additional number of consumers, they could get what prices they pleased, and raised their demands to such an extravagant degree, that it would have been better if the whole provisions for the settlement had been imported from a distant market. In fact, it was found necessary to send to Nova Scotia for a quantity of flour. Throughout this business some trouble was unavoidable; but of this the settlers in general had no share. From the moment they were fixed in their respective allotments of land, they were enabled to proceed without interruption in their work.

"A gentleman of medical knowledge, who had accompanied the emigrants, and assisted in the management of the undertaking, settled among them in a central situation, from whence his professional aid could soon be afforded to any part. Not very far from the same place, a forge was erected; a blacksmith was the only artificer who was judged to be indispensably requisite; for in consequence of the small progress of the division of labour among the Highlanders, every man is in the habit of doing for himself most of the other branches of work, for which the aid of a professed tradesman would be required by people more accustomed to the habits of commercial society.

"To obviate the terrors which the woods were calculated to inspire, the settlement was not dispersed, as those of the Americans usually are, over a large tract of country, but concentrated within a moderate space. The lots were laid out in such a manner, that there were generally four or five families, and sometimes more, who built their houses in a little knot together; the distance between the adjacent hamlets seldom exceeded a mile. Each of them was inhabited by persons nearly related, who sometimes carried on their work in common, or, at least, were always at hand to come to each other's assistance. This enabled them to proceed with the more vigour, as there are many occasions, in the work of clearing away the woods, where the joint efforts of a number of men are requisite, and where a single individual can scarcely make any progress. There is a great advantage in clearing a considerable field, rather than the same extent of land in detached spots, as it

does not suffer so much from the shadow of the surrounding woods. Besides this, the work of several men being collected in one place, made so much the greater show. The progress of each, insulated by itself, might have appeared poor and insignificant; but when united, when the forests were seen receding on every side, all were animated by the encouraging prospect of advancement. Experience, too, was rapidly communicated among people thus concentrated; emulation was kept alive; and, when any one was inclined to despondency, the example and society of his friends kept up his spirits. To their families, this social style of settlement was a comfort of the utmost importance for cheering their minds, and preventing them from sinking under the gloomy impressions of the wilderness.

"This plan was the more readily acquiesced in, from its similarity to the former situation of the small tenants in their native country; and, in many instances, a party of relations were willing even to take all their land in one large lot in partnership. This, as a sociable arrangement, I was disposed to encourage: it was found, however, to lead to much trouble in the subsequent stages of the business, as the partners soon began to wish for a subdivision, and this was seldom accomplished without a good deal of wrangling. The advantage of concentrating the settlements might have been attained without incurring this inconvenience, and is of such essential consequence to people who are unaccustomed to the woods, that it ought not to be given up for any motive of inconsiderable moment.

"Before the settlers had dispersed to their several lots, while they were still in the encampment which they had formed on landing, some of the inhabitants of the island were employed to build a house, so that all had access to learn the methods used: some land was afterwards cleared in a situation they had frequent opportunities of seeing. From these examples they appeared to receive no small instruction; for, though their first trials of the axe were awkward, they improved rapidly.

"Their houses were, indeed, extremely rude, and such as, perhaps, few other European settlers would have been satisfied with. The first buildings of the American *woodsmen*, from which our people took their model, are constructed without any other materials than what the forests afford. The walls are formed of straight logs, about eight inches in diameter, rough and undressed, laid horizontally, and crossing each other at the corners of the building, where they are coarsely grooved or notched about half through, to allow each log to touch that immediately below it: the chinks between them are stuffed with moss, clay, and small wedges of wood. The roof is formed of birch bark, or that of the spruce fir, peeled off the trees in large unbroken pieces, and secured by poles tied

down on them with wythes or pliable twigs. This covering, if well laid, is sufficient to keep out any rain, but must be protected from the sun by a covering of thatch; for which purpose aquatic grasses, or the small twigs of the spruce and other sorts of fir trees, may be used. Houses of this kind, of fifteen or eighteen feet, by ten or fourteen, were the dwellings of many of the settlers for the first season.

"The hardy habits of these Highlanders gave them, in this respect, a great advantage over people who are accustomed to better accommodation, and who would have employed a great proportion of their time in building comfortable houses. They, on the contrary, had soon secured themselves a shelter, poor indeed in appearance, and of narrow dimensions, but such as they could put up with for a temporary resource; and immediately applied themselves with vigour to the essential object of clearing their lands. Notwithstanding this work was of a nature so totally new to them, they applied to it with such assiduity, that before the winter set in, they had not only lodged themselves, but made some progress in cutting down the trees. This was continued during winter, whenever the weather was not too severe: and, upon the opening of the spring, the land was finally prepared for the seed.

"The zeal with which they proceeded in their work, was exemplified by a man of above sixty years of age, who with his three sons, inhabited one of the little hamlets that have been described. The young men had agreed among themselves, that as this new species of labour would be too severe for their father, he should do nothing till, from the progress of the clearing, he should employ himself in some sort of work he had formerly been accustomed to: the veteran would not, however, be dissuaded from taking up the axe, till his sons found they had no recourse but to secrete it from him. In another instance, this zeal appeared rather in a whimsical manner. In walking among the settlements, I came unexpectedly to a house newly erected by an elderly widow and her two sons. The young men had gone from home upon some business; the mother, having no immediate occupation within the house, had taken up one of the axes they had left behind, and with amazonian vigour had begun to attack a tree. She had made some progress, when my coming up interrupted the work—rather fortunately, I believe; for the good old lady had proceeded with more ardour than skill, and there appeared to be some danger that, in the progress of her work, the tree would have fallen on the roof of her new habitation.

"The settlers had every incitement to vigorous exertion from the nature of their tenures. They were allowed to purchase in fee simple, and to a certain extent, on credit: from fifty to one hundred acres were allotted to each family at a very moderate price, but none was given gratuitously. To

accommodate those who had no superfluity of capital, they were not required to pay the price in full till the third or fourth year of their possession; and, in this time, an industrious man may have it in his power to discharge his debt out of the produce of the land itself.

"The same principle was adhered to in the distribution of provisions; for though several of the poorer settlers could not go on without support, every assistance they received was as a loan, after due scrutiny into the necessity of the case, and under strict obligations of repayment with interest. Thus, while a remedy was provided for cases of such extreme necessity as might otherwise have put a stop to the progress of the settlers, they were not encouraged to reliance on any resource but their own industry; and their minds were not degraded by the humiliating idea of receiving any thing like charity. The proud spirit that characterized the antient Highlander, was carefully cherished among them: the near prospect of independence was kept constantly within their view, to stimulate their exertions, and support them in every difficulty.

"Having calculated the arrangements necessary for the progress of the settlement, and having left the charge of their execution in the hands of an agent, whose fidelity and zeal I was well assured of by long previous acquaintance, I left the island in September, 1803; and, after an extensive tour on the continent, returned in the end of the same month the following year. It was with the utmost satisfaction I then found that my plans had been followed up with attention and judgment. Though circumstances had intervened to disturb, in some degree, the harmony of the settlement; they had produced no essentially bad effect; and the progress that had been made was so satisfactory to all concerned, that little difficulty occurred in healing every sore.

"I found the settlers engaged in securing the harvest which their industry had produced. They had a small proportion of grain, of various kinds, but potatoes were the principal crop; these were of excellent quality, and would have been alone sufficient for the entire support of the settlement. The prospect of abundance had diffused universal satisfaction, and every doubt as to the eligibility of the situation seemed to be removed. In the whole settlement I met but two men who showed the least appearance of despondency. There were three or four families who had not gathered a crop adequate to their own supply: but many others had a considerable superabundance. The extent of land in cultivation at the different hamlets, I found to be in general in a proportion of two acres or thereabouts to each able working hand: in many cases from three to four. Several boats had also been built, by means of which, a considerable supply of fish had been obtained, and formed no trifling addition to the stock of

provisions. Thus, in little more than one year from the date of their landing on the island, had these people made themselves independent of any supply that did not arise from their own labour.

"To their industrious dispositions and persevering energy, the highest praise is justly due. Without these, indeed, every other advantage would have been of no avail; for, if the arrangements that have been detailed have any merit, it may all be comprised in this—that by their means the industry of the individual settlers was preserved unimpaired, was allowed full scope to exert itself, and was so directed, as to produce all the effect, or nearly all, that it could produce."

The introduction to this account contains much historical matter concerning the ancient condition and progressive alteration of the Highland tenantry. The striking features of their manners were traditional peculiarities resulting from experienced expediency. In a new country, under new tenures of property, with a soil inviting less to pastoral and more to agricultural pursuits, these peculiarities would no longer be wise, and will therefore not be permanent. It may be pleasant to the old to hope that they are bequeathing the language and customs of their patril mountains to another transatlantic country; but an entire confusion of their dialect into the English of the neighbourhood, and an approximation of their manners to those of the American woodmen, is a more probable and a more desirable result. Much merit is due to those reasonings of the earl of Selkirk (they occur chiefly in the sixth section), which attack the sophisms lately advanced against emigration: his mind is superior to the provincial prejudices of the Frasers and the Irvines, he perceives that he is

serving both his country and mankind by placing the labourer where toil is most productive. How few noblemen at the earl of Selkirk's age have acquired his claims on national gratitude! Not content with the inclosure of a heath, or the display of taste in cottage architecture, he clears a huge forest hitherto untouched by man, and converts the vast solitude into a fertile field; he leads the cow and the sheep to graze in marshes known only to the beaver and the morse; he rears the homes of a thousand men, where the bear and the serpent bred. We hope the earl will not always be separated from the clients of his beneficent patronage. The British provinces along the river St. Lawrence ought to be divided into more governorships; because each count has the effect of making a city, and of preserving by importation a perpetual sample of civilized and European men. To one of these governorship's we should wish, for the country's sake, to see an activity transferred, which would soon accomplish for a whole province, what it has realized in so considerable a district.

Where the Roman conquers, he inhabits; says Seneca. Where the Briton inhabits, he conquers; and that is a purer praise. He seizes on the wilds of nature, and adds them to his empire, by planting there the industry that will fertilize the soil, and the laws that will civilize the people. His invasions are made with the pruning-hook, and the plough; his levies and contributions are an interchange that is to enrich; his encampments are fairs and warehouses: the corn springs along his path, the city climbs beside his resting-place.

ART. VIII.—*Political Papers, comprising the Correspondence of several distinguished Persons, in the Years 1792, 1793, &c. with the Editor, the Rev. CHRISTOPHER WYVILL, Chairman of the late Committee of Association in the County of York. Vol. 5. 8vo. pp. 448.*

OF Mr. Wyvill's Considerations on two-fold, or gradationed, Election, a detailed critique was given in our third volume, p. 288. That tract reappears here, preceded by various public papers, emanating from societies confederated for the obtaining of parliamentary reform, and accompanied by much private correspondence with the acting members of those associations. The volume forms a desirable continuation of the history of a political sect, whose earlier proceedings are already recorded in four volumes, formerly published by the same editor. We

shall discuss with no less freedom the debated and voted projects of the voluntary convention of chieftains, than we applied to the examination of Mr. Wyvill's personal scheme.

The most important paper is No. XII., which contains a declaration of the principles and plan of parliamentary reform, recommended by the Society of the Friends of the People in 1795.

These friends of the people are known in the literary world by various resolutions and epistles, and especially by the publication of a petition presented to parlia-

ment, which every reader must acknowledge to be a masterly bill of attainder against the most valued branch of the constitution. To the petition succeeded this *declaration*, containing a plan of the representative assembly, which the society proposes to substitute instead of the heterogeneous body that has so long governed us so tolerably. As a work of literary art, the declaration is inferior to the petition. The contained scheme merely proposes dividing the country into 513 districts; and suffering the *householders paying parish-taxes* to elect one representative for each district. The subject is not yet of critical importance, as the people have never been called on to carry the plan into execution; it is not therefore too late to discuss it calmly. We may be allowed to interpose some humble animadversions.

At p. 19, it is asserted that 'for all the *practical* uses of representation, the poorest man in the kingdom will find himself as effectually represented by this plan, as if he voted in it himself.' The like might be predicted of the present house of commons with equal probability. This method of election by taxable house-keepers will exclude a vast class of *journeymen*, and will admit their *employers* to vote. Now it is one among the grievances of the poor that the wages of labour are in many instances inadequate; and that the combination of journeymen to procure redress is forbidden by statute. This law may not be repealed by a parliament so chosen. It is among the grievances of the poor that the privileges of apprenticeship are only obtainable by too long a servitude. This restriction may not be removed by a parliament so chosen. It is among the grievances of the poor that leather, soap, candles, salt, sugar, beer, and other of their absolute necessities, are too heavily taxed. These burdens may not be commuted by a parliament so chosen. At least the constituent body would have little motive to desire such changes.

Again; with the progress of luxury and of taxation, and with the decline of the religious spirit, the eleemosynary virtues are growing scarcer. To the industrious visitation of individual hovels have succeeded indolent ostentatious contributions to establishments of beneficence. We now do good by machinery, not by personal labour. Paupers have consequently need of a right of suffrage frequently exercised, in order to recover the useful no-

tice of the classes immediately above them.

The *practical* uses of representation to the most numerous class of the people are likely to be wanting on the exclusive system. It has not an equal claim with the system of universal suffrage to the support of the benevolent. Experience amply proves that the interests of the *excluded* classes are little heeded in free governments. How oppressive to young men under twenty-five is the law of conscription in France! it originated under a system of suffrage confined to those above five-and-twenty. How oppressive to the peasantry of Poland was their vassalage! it was retained, even during the paroxysm of a revolution, by a legislature of land-owners. How oppressive is the policy of the church of England to all classes of sectaries! being excluded from public employments, they cannot get at redress.

The provision relative to a new division of the country is brought forwards at p. xxii, and very small shires are recommended. Why? In order to confine political power to the feudal aristocracy, in opposition to the monied interest? The smaller any of these divisions, the more secure is resident individual wealth of influencing the elections. The larger any of these divisions, the more secure is public opinion of bearing down before it the influence of individual wealth. The representation of Rutlandshire is as regular an appurtenance of the great land-owner, as the representation of Yorkshire is of public opinion. The influence of wealth is in proportion to the contiguity: operating on the chapmen whom it can patronize, or the inferiors it can countenance, it lessens rapidly with distance: whereas the influence of opinion is equally intense at every distance from the focus. Men of riches have an interest in procuring a division into small shires. Men of celebrity have an interest in procuring a division into large shires. The friends of the people have decided against the talent, but in favour of the property of the country; they are for excluding merit in behalf of wealth. For this purpose no innovation was necessary: the subsisting qualification secures it sufficiently.

If these 513 divisions are to consist, as nearly as possible, of an equal number of square miles, they may become convenient as military districts, or wapentakes: where the distance of the place of drill is the chief consideration. But in this case they will confer representation in the in-

verse ratio of the populousness: London may have to depute but one member, and an equal space on the wolds of Westmoreland may do the same.

If these 513 divisions are each to contain an equal number of houses, they must be perpetually shifting their frontier; and streets of voters must be hitched at each election from a familiar to a strange controversy. Some of the divisions, as in the metropolis, will be very small; others, as in Cornwall, will be very large. This sort of deformity has been preferred, and wisely preferred, by the friends of the people: yet there is inconvenience to be feared both from the mutability and the inequality of their districts.

A sufficient reason is assigned, p. xxii., why these divisions should not each choose two members; because thus persons of opposite principles are often sent to represent the same place: but the motive for preferring one to three is not so satisfactorily explicable. The larger these divisions are, the more easily will the people themselves be enabled to carry the plan into execution; because in every large district some persons of weight, of zeal, and of intelligence, are to be found, who are addicted to innovative politics, which is less certain in a small district. Now all sweeping schemes of reform ought to be constructed on the principle that they are one day to be realized independently of the government: as, without this facility, no sufficient motive can ever be offered to the existing legislature for perpetrating a political suicide, by bestowing its sanction. A map should be made of the projected distribution, and circulated among the reformers.

One argument may be offered for preferring a size of shire which shall depute three representatives, to a size adapted for deputing one, two, or four. If the majority in favour of a given party be in each shire but of a single vote among the people, this will, in the meeting of their three delegates, produce a majority of two to one in the legislature: consequently the tendency to acquiesce in, or the difficulty of resisting, the will of a mere majority of the people, will always by these means be very great. Whereas, if one, two, or four deputies be nominated by the rival factions, and each party has its half of the representation to marshal under, every popular faction must divide the constituted authorities in the same proportion as it divides the people; which could not but be dangerous to public tranquillity, under

a form of government where the national representation were the seat of authority.

A second provision of this plan is, that the election of the whole representation of the kingdom shall be made at the same hour and on the same day. One would have thought that British experience had evinced the absurdity, mischief, and nuisance, of such a regulation. Would the representatives of the people have been deserted in 1784 by the constituent body, if the public ferment occasioned by the coalition had had time to cool? The wisdom of national decisions is always endangered during moments of popular effervescence. In consequence of speeches delivered with glow, and circulated with zeal, or of some pamphlet written in a manner unusually impressive, it often happens that the mass of a people are at a given moment operated on by the arguments on one side only: and that, while the impression of these reasonings is recent, their occasional declarations would be contrary to their settled will, their momentary passion different from their deliberate opinion. They are in a like state with the audience of a debating school, during the plaudit which succeeds the harangue of a favourite sophist; at that instant they would vote differently from what they will do at the close of the discussion. Now if, during such ebullitions of prejudice, a complete dissolution of the legislature occurs, the mass of representatives will be sent in conformity to this transient impression, and the measures of government will partake the cast of popular vehemence. The people therefore ought not to intrust themselves at any one time with the choice of a majority, or even of a half of the legislature. But if one-third only, or any less number, be to go out at once; the chance must be, that the settled should prevail over the occasional will of the people, the slower but maturer decisions of their judgment over the hasty phrenzy of transient impatience.

Another important danger to which the freedom of nations has been exposed in all revolutionary periods, is the extra-legal perpetuation of authority in the hands of their leaders. The thirty tyrants of Athens, the decemvirs of Rome, the long parliament of England, the cruel parliament of 1716, the French convention, have all forcibly prolonged their power beyond its just period. For these usurpations no remedy has been found short of insurrection. It ought to have been considered, that if the whole of a representa-

tive body have at once to vacate their seats, that whole body may be interested to put off its dissolution, and to protract illegally its sittings; and that if one half be to go out at once, one half is liable to that wish, and may find it easy to gain over a vote or two, and thus effect its purpose. Whereas if one-third only, or any less number, be to rote out at once, the chance always must be that the legislature itself will compel the punctual observance of the law (two-thirds having, by the hypothesis, no interest in the breach of it), and thus secure to the people a regular periodical renewal of their choice.

For both these reasons partial rotation is essential to wise representation. The prerogative of entire dissolution, or simultaneous dismissal of the delegates, ought to be withdrawn from the crown. A further objection is, that the cotemporary meeting of all the constituents of a house of commons, legally calls into action a power necessarily greater than that of the government, whose stability, in democratic times, might thereby be attacked.

A defect of this declaration is, that concerning the *duration* of parliament nothing is stated, except that it may safely be triennial, biennial, or even annual, on the plan recommended. We deprecate very short parliaments. It is not the duty of representatives to decide in all cases as the people themselves would decide; but as it is best for the people that they should decide. Not the coincidence of their opinion with that of their constituents, but its coincidence with universal justice, is the rule of approbation. Now the shorter the time a delegation lasts, the greater the probability of obedience to the constituency. In order then to diminish the influence of hasty, vulgar, and unsound opinion, time enough ought to be given for sudden ferments of the public mind to subside. The representative should have a chance of assuaging his own better judgment on the multitude. A year in the present state of instruction is evidently too little. Triennial are therefore preferable to annual parliaments. But annual elections are compatible with triennial parliaments; of three county-members one might rote out yearly. Or, under sexennial parliaments, one rote out biennially. This would keep alive a sufficiently frequent appeal to the people; and, by influencing progressively the divisions in the house of commons, would abate the insolence of power, and intercept the despair of secessions. Short par-

liaments would cheapen too much the dignity of a representative; and the collective body would lose weight and power in the state from the comparative insignificance of the component individuals. Six years is not too much for a demagogue to unfold his general plan of conduct and legislation: time should be allowed for apprenticeship to the local circumspection requisite. The liberties of France are gone; because every body who coveted a seat in the house had been accommodated: there was no motive to be anxious any longer for a college of tribunes. All the fire-flies, that chose, had shone, and had burnt out their phosphorus. The parliament of Britain produced fewer great men during its trienniality, than since the prolongation.

A great reform has been accomplished in the British parliament by the introduction of the hundred new members from Ireland. The effect which lord Chatham anticipated from increasing the number of representatives is already very discernible: a consciousness of strength, a spirit of independence, is rising anew. The noblest addition would be to suffer the unrepresented towns to frame a charter for themselves. It is within the competence of the royal prerogative to grant such charters. Any homogeneous system of representation has its inconvenience. Some one sect or interest would preponderate, and would new-model every thing by its peculiar will. There is no tolerance when a majority has counted noses: the puritans of England, the libertines of France, overwhelmed their opponents as with the tide: but the waters ebb'd, and one has now to lament the want of those holds and anchorages which, if the parliaments of France, or the municipal corporations, or the provincial states, had been specifically represented, might perhaps have been found. As the best administrations are those which consist of an aristocracy of strong minds culled from rival and opponent parties; so the best representations are those which leave unconfused the natural sources of social influence, and admit them all in due proportions. We should like to have twenty or five-and-twenty tribunes of the people, eligible by universal suffrage without any qualification of property, superadded to the extant legislature. Let us see if they could contrive to better the condition of the poor or of the rich, to strengthen the gravitation of allegiance, or brighten the radiance of public glory.

A homogeneous representation of the people would be disconnected with the nobility, would be disconnected with the crown. If equally numerous with the present house of commons, one chance is, that the same quantity of patronage would be equally operative. It might annex itself as an humble appendage to the hereditary branches of the constitution, accept distributions of emolument and honour from the minister for the time being, talk about the public and care for itself—in this case nothing would be gained by the alteration. Another chance is, that it would display a spirit of independence, increase its own authority at the expence of the hereditary institutions, and encroach both on the influence of the crown and the privileges of the nobility. This is the more probable event: it is the expectation, the hope, the desire of the people, and their motive for soliciting reform. Now can any politician, who has read the history of England through the last, and of France through the present century—who has considered the nature, spirit, and tendency of a popular assembly, strong in the fresh confidence of the people, and anxious by splendid enterprise not to disappoint the expectations formed from its long-protracted hard-earned approach—can any less tutored politician doubt, that such a body will be willing and able to encroach, not merely on the mischievous prerogatives of the crown, but on royalty itself; that it will once more vote the house of lords superfluous, concenter in its own hands a legislative omnipotence, and then employ it in breaking up all our corporations and establishments? This rational conviction is grown so general, that those, who are not republicans, consider these sweeping projects of innovation as volcanic ground, which the cautious tread of a constitutionalist has to avoid; and begin consentaneously to turn away from every plan of parliamentary reform, which goes to the length of representing the people.

The republicans, on the other hand, would perhaps be blameable, if they stopped short at a plan of reform for one house of parliament only. Mr. Fox has wisely said, that every unmix'd government is bad—simple monarchy, simple aristocracy, simple democracy, have severally been found oppressive. Legislative omnipotence intrusted to any individual, or to any corporation, is a power too great to be wielded well by men. The exclusive sway of a despot or of a citizenry,

the monarchy of a king or the monarchy of a convention, is tyrannous alike. It should seem therefore that, if ever the lower house be strengthened by connecting it with the mass of the people, a new, a stronger, and more elective upper house, ought also at the same time to originate, in order to keep its authority in equipoise, and to divide and moderate its power. Can it be less legal to conspire the new-modelling of the one than of the other house of parliament? Why not substitute the pursuit of a constitutional reform to that of mere parliamentary reform? Our nobility grows too numerous for the expedient concession of an entire vote in the upper house to each of its members. Why not limit the peerage to direct descent? Why not confer an elective character on the whole upper house, vesting the choice exclusively in the nobility, and granting one vote to knights, two to baronets, four to barons, six to viscounts, eight to earls, ten to marquesses, and twelve to dukes, in the choice of their proxies, or delegates?

The remaining public papers are of little moment.

The subsequent correspondence, though somewhat dull, from the unvarying tone of reciprocal panegyric in which it is conducted, deserves a short commentary.

At page 75, Mr. Wyvill blames the friends of the people for not expelling Mr. Cartwright. And what was the crime of Mr. Cartwright? He was a friend to universal suffrage. It is mortifying to see these would-be reformers behaving like bishops at a council; intolerant to every aberration from their own confined creed; and, while they are complaining of the exclusive spirit of the state, themselves getting up an interior ostracism to defraud principle of its confessors, and the poor of their advocates.

At page 115, we find Mr. Wyvill coalescing with the government-party, and subscribing those declarations of allegiance which had been indirectly called for by the proclamation against seditious publications and assemblages. These meetings for the declaration of loyalty took place throughout the kingdom in November and December 1792. The old reformers, whose associations were of ten years standing, chose to distinguish themselves from the new reformers, who were more apparently aimed at in the proclamation. The old reformers signed the constitutional tests: at least Mr. Wyvill and his friends did so. They do not scruple to

in favour, let the old way remain : if change is wished, let change be speeded. Such reforms in detail could give no alarm, and might, with much assent to the reformers, correct, in the course of two parliaments, the chief inequities of the established arrangement. We exhort Mr. Wyvill and his friends to take into consideration the propriety of partitioning the legislature for a subdivision of Yorkshire into three counties, and for therein limiting anew the right of suffrage. If no effort be made to abolish or inlarge on the boroughs, which are guarded by all the jealousies of private property,

it is probable that parliament would listen to petitions for introducing thirty or forty additional members. Westminster might petition for the liberty of choosing three instead of two representatives. Wapping, a district of the metropolis, which the docks will render very important, might petition for an especial charter of representation and police ; nor ought it to choose fewer than three members. Manchester, Birmingham, Sheffield, Leeds, might apply for a singular privilege, and receive the grant of one or two representatives according to their respective populousness.

ART. IX. *Reasons why the Society of Friends should not vote for Members of Parliament.* 8vo. pp. 19.

THE whole argument of this little pamphlet is contained in these two paragraphs.

"A representative is one who personates, supplies, the place of another, and is invested with his right and authority ; consequently the voter sends him with full power to act in the house agreeably to the established law of the land, which chiefly consists of these particulars :—to preserve the constitution as it now is, and to agree to such alterations, or to assist in the framing of, and passing such acts, as may be requisite more firmly to establish the present government : to vote on the mutiny act annually ; for the maintenance of the army and navy, and the church establishment, when necessary. He must vote the taxes to defray the expences occasioned by the increase of military and naval expenditure, that war may be prosecuted to the utmost extent, according to the resources of the country ; and to vote the subsidies to foreign princes, to strengthen their alliance, and to enable them to raise, and bring into the field, their contingent quotas of men.

"The voter delegates the representative, and invests him with all his power : instead of going himself, he deposes another to represent him, and exactly approves a system, the basis of which is war, and the established religion by a forced maintenance. I shall suggest one query for consideration, whether such voters are not implicated, in so doing, with the disastrous consequences which war entails ; and shall insist that they are parties therein."

We differ diametrically from this casuist, and think that the proper form of protesting against war is to depute such men to parliament as will favour pacificatory councils ; but not, as is the usage of quakers, to shun the burden of public defence. In like manner, we think the proper form of protesting against tythes is to depute

such men to parliament as will propose their abolition ; but not, as is the usage of quakers, individually to withhold that levy. For, if instead of obeying laws emanating from the agreed agents of the community, citizens were, on each occasion, to assert a claim of private judgment concerning the expediency of such public commands, and were separately to disobey whatever laws they did not approve, a complete anarchy would ensue. No revenue could be collected to keep even a road in repair ; no criminal legislation enforced ; no territory defended against invasion ; no public purpose whatever carried into execution ; the advantages of society would all cease at once.

Hence the moral obligation to obey even the laws we disapprove is stronger than the duty of bearing testimony against any human absurdities, however diffusive, obstinate or vexatious. The object of such testimony being merely to better the temporal condition of mankind, it would be absurd to sacrifice the end to the means.

Only in the jeopardy of those paramount interests, which are supposed to affect the eternal condition of the soul, can it be defensible for individuals to behave toward a mild magistrate, as toward a tyrant and a plunderer. There must be warrant from scripture to warrant civil disobedience. This the quakers cannot find, either in the case of military conscription or of levying tythes. John the baptist exhorted the soldiery (Luke, iii. 14.) to be content with their wages. Peter baptized Cornelius, a centurion, and other devout soldiers (Acts, c. x. v. 7.) of his company. John the evangelist is probably John the Essene, whose eventual military consequence Josephus (*De Bello Judaico*, lib. iii. c. 2. § 1.) repeatedly notices. The

profession of a soldier is not merely a permitted but an honoured employment among the founders of christianity: it has the sanction of the master himself; see especially Luke, c. vii. v. 6—9. In the discharge of taxes Jesus was no less an exemplary citizen. He had been long a resident at Capernaum, and, on revisiting his place of abode, they that received tribute came to Peter and said: 'Doth not your master pay tribute?' He saith: 'Yes.' (Matthew, c. xvii. v. 24—25.) And again, when consulted by the Herodians about the expediency of submitting to Roman taxation, he expressly teaches submission (Matthew, c. xxii. v. 21.) to the sovereign for the time being; and advises

that, while the image and superscription of the coin were Cesar's, to him, though a heathen, tribute should be paid. The tythe is notoriously a tax of Jewish origin (Leviticus, c. xxvii. v. 30—32.), and more conformable to scriptural authority than these Roman capitations. The resistance of the quakers to soldiering and to tythe is therefore not merely anarchic, but anti-christian.

We counsel this author to reconsider his argument; and to set about predisposing the members of his sect to confirm their protest, or testimony, against the laws, to a wholesome interference in elections.

ART. X.—*An Attempt to rectify the public Affairs of the United Kingdom and Empire, and promote their private Prosperity, illustrated by many national Projects hitherto not rendered effectual; with a Proposal for making an immediate, durable, and advantageous Peace: humbly addressed to the Legislature. By the Author of the Income or Property Tax. In three Volumes, 8vo.*

THERE are four motives for making books: 1. The desire of attaining an end; 2. The desire of gain; 3. The desire of fame; and, 4. The desire of composition. This book is so driftless, so useless, so temporaneous, that it cannot but have been drawn up to gratify the latter of these motives. It seems entitled therefore to that indulgent sort of reception, which hobby-horsical amusements, that are innocent, obtain from the politeness, if not from the complacency, of the bystander.

This is more than an innocent, it is a well-intended, but it is a long-winded exertion: panting praise would toil after it in vain. As in a maggot-race ring draws ring after ring with most visible progress and most insensible advance, the turgescence of effort travelling at every hitch from head to tail, and back again—so here section drags on section, and chapter, chapter; and at every fresh topic the author stops to recapitulate and retrace the little whole length of his political crawl. Still the wish to be useful is no less obvious than the wish to be busy. Gratitude balances every feeling of annoy. The love of country is estimable even in the prattle of its dotage. If patience in the reader is attended with long-suffering, it will be followed, like going to church, with moral consolations.

The introduction narrates the author's motives for attempting to rectify public affairs; and gives an outline of his design.

The second chapter recommends the

institution of parish-agencies; or the substitution by government of a power now confided to elective overseers. This may at first appear to save trouble to the parishioners, and to favour the comforts of the poor. The pauper-monger appointed by ministry will feel less solicitude about the interests of the payers, than an overseer appointed by the parish, and will not care less for the good-will of the poor. But all such appointments by government degenerate in a few years into mere jobs; into hospitals for decayed vallety and dependents of ministerial land-owners. The hired pauper-mongers, like new brooms, will at first sweep clean; by degrees they will become useless pensioners on the poor's rate, which, for the sake of their percentage, they will be very alert to increase. Elective and rotatory institutions, on the contrary, always retain their elasticity. They are less brilliant than those new patent patronized methods executed by the zeal of vanity for the parade of publicity; but they are of less transient operation. There is the same proportion of good overseers now as there was in the forty-fourth year of Elizabeth.

Another plan for the increase of ministerial patronage, which this author discusses, is a corporation for national information, a sort of clergy to teach the arts of this life, 'such as (page 191) agriculture, medicine, mental improvement, and practical jurisprudence.' This plan might be licked into form. The churches might, for half the Sunday, be put at the disposal

of the surgeon; who might lecture on the importance of temperance to health; of hollow-draining, to springy lands; of dancing, to military proficiency; and of the principles of mechanics, to the vulgar arts. He might read chapters out of Blackstone, or out of Burn, dissert on British history, and promulgate the new laws with expositions. The tythes might then be divided between the guardian of the body and of the soul; between the teachers of our wisest course for here and for hereafter. It might be doing too much at once suddenly to make the alteration, more than prejudice to-day would bear: but it would certainly not be amiss, we are serious here, if at least one living in every hundred were immediately to be held by a medical instead of an ecclesiastical qualification. This would secure, or at least motive the requisite education in country surgeons, and could be made compatible with the respect due to college property. In a thinly peopled neighbourhood no surgeon can earn an indemnity for an expensive frequentation of the metropolitan schools of medicine; yet in every neighbourhood skilful medical help ought to be within call.

The third chapter treats of the finances. In the table of contents some very novel plans are promised for paying our debts and increasing our revenue; but alas! we find nothing but the old resources, economy and peace, sinking funds and taxes. We will give one hint to the author. On paper it is easy to be magnificent: nor would petty wares avail in our vast chasm. Lay a land-tax on the whole peninsula of Hindostan. Send over the necessary people to survey and to assess the vast district. As an indemnity for taxing their soil, relieve their trade, and throw open, free of duty, their ports, and those of Britain to each other. Open at Calcutta a bank for receiving this revenue: and let that bank there sell stock in the English funds, and there pay dividends on stock so sold. The form of remitting money home will then consist in buying at the Calcutta bank a perpetual annuity in the British funds; and all the hoards of our nabobs will become loans to the state. The dividends being payable in that country, and secured on their own land revenue, a great deal of native property will gradually take confidence and place itself there; so that one or two hundred millions of our national debt would migrate of its own accord, and make room here for the creation of as much fresh stock. From reckoning

our debt by lacks of millions, we may bravely aspire to extend it to a crore.

Land-taxes, which are of all others the wisest, because they encroach on the revenue only of the idle, are peculiarly difficult under the British constitution, on account of the sympathy felt for the burdened class by the proprietors who are crowded in both houses of Parliament. This country has consequently been always the victim of its anti-commercial system of indirect taxation. If lord North had spared the tea, and rated the soil of North America, the colonies would not have murmured; their landed interest was a feeble fragment of their population. He might then have instituted in New York an office for paying dividends out of the land-tax, and have funded there vast supplies of capital toward the wars of this country, instead of their funding here the national debts of America. Every colony ought to be founded on the principle of paying an increasing quit-rent for its land. There would then be a secure local revenue to mortgage for the remunerative expence of protection.

The fourth chapter treats of agriculture, and recommends to the state to take into its own hands the whole farming system; to contract with Irish rebels for the digging of potatoes, and with the women of Billingsgate for the crying about of milk. This writer rivals sir James Steuart in his rage for regulating and meddling. We doubt not he would think it rational in government to open retail shops, under pretext of securing the excise duties, and to sell, on account of the lords of the treasury, calicoes, dish-clouts, mutton, and mustard.

The fifth chapter, which prosed about national industry, fills the whole second volume. The best thing that can be done for the internal improvement of the advantages of the country is to delegate the power of passing inclosure, road, and canal bills, to local courts of magistracy; so as to diminish the expence of acts of parliament, and to facilitate the examination of evidence on the spot. Such courts might have a jurisdiction coextensive with the circuits of the judges; might sit during the recess of parliament; and might comprehend deputies, nominated by the justices of the peace and by the corporations of the towns, or their head-officers. Parliament ought to be rid of the detail of local legislation.

The sixth chapter, which occupies the greater part of the third volume, advises

an immediate peace. Mr. Edwards would have us keep Malta, give Egypt to France (which may become very expedient, however impertinent) and conquer for ourselves all Assyria:

This writer is not so precautions as Mrs. Glasse, who instructs her pupil to catch the hare before she directs about the cooking.

Appendix after appendix thicken these volumes into portly ponderosity. The projects which pass in review are mostly notorious, and are rather expounded than discussed, or appreciated. One of the most peculiar, and of the favourite projects of the author, is the institution of parish agencies, which is more concisely and explicitly recommended in the concluding appendix than in the first volume, and which we shall republish in the form it there receives.

“Such persons as may have read the preceding work may be presumed to be in general convinced of the infinite importance of public agency, as it has been proposed for innumerable concerns useful to the nation at large, various in their kind, and yet still more remarkable for the difference of their extent, referring alike to the most minute particulars of internal police, and to proposals as boundless and opposite to each other, as the five preceding are. At the same time these concerns or proposals, to which it is essentially necessary, are considered to be indispensable for the maintenance of the future greatness and prosperity of the empire. However, it is requisite to insist farther upon the subject in respect of the importance of the combination of public agency with the present magistrates and different parish officers, which is proposed under the general substitute, as see chapter third.

“These at present are intrusted with vast powers, but are under no controul: for any appeal which the law affords is nugatory, and will not be had recourse to, unless they commit great offences. They differ, in this respect, from all other of the civil orders, even the clergy being subject to strict discipline. They are, in fact, exempted from the regulations of police, as if a sense of the presence of an active controul over their conduct would not produce a salutary attention to their respective duties. Let it be supposed, that they are highly valuable in their respective offices, and their services indispensable: yet the magistracy, like all other orders, will produce occasionally, or often, individuals, whose general conduct may be reprehensible: and parish officers are still more frequently delinquent. Some degree of controul here is therefore requisite: and a barrister associated with the former, though his jurisdiction is extended to two or more circles, and an agency

steward with the latter in every circle of the kingdom, will be as small a check as can be introduced; and must answer very important purposes. Thus the conduct of both may be duly regulated, and the functions of their offices happily discharged in all respects: and as they together constitute a body of police, they will be more respected; and will be an effective agency, with which refractory and pretended paupers, or those who perform statute work upon the roads, will not trifle. At the same time the check commissioners might be obliged by law to select a proper committee, or committees, to act on the occasion, both for a circle in general, and for the different parishes and townships. These would maintain the cause of the people, while they would thus co-operate with this general body of agency, in advancing the welfare of the country: and the different orders, emulous of following their example, would not be content with the mere performance of their public duties, but would cordially enter into the spirit of them.

“Parish or township officers left as they are, to themselves, are often negligent to an extreme, or commit the grossist violations of their duties; or frequently are incapacitated to perform them; or, engaged in their own affairs, cannot spare the time necessary for the proper execution of those which relate to the public. These last they overlook in such a manner, as to render ineffectual many highly salutary regulations of the legislature: and in respect of the first plan to be proposed for the diminution of poverty in general, are very injurious, as they attend not the numerous families among the lower orders, inattentive to form their children to those habits of industry, that are the surest means of reducing the poor rates. It is impossible here to describe the amount of the detriment, or in what different respects they are injurious to the country. Yet they are capable of being chosen, and of being subjected to co-operation with the circle stewards, by such proper regulations of police, as would render very valuable services. Thus they may every where assist the agency steward throughout the extent of the circle, and yet experience less trouble than they do at the present time; while, seated in the centre of population, he may there employ inferior agents as these may be wanted, or dispatch them as they are required in different parts. They would of course be employed to superintend different kinds of work, carried forward in their respective neighbourhoods, and to enter proper minutes for the purpose. Farther, they would readily furnish him with local information, as well as take upon them a great part of the trouble of the agency. Thus a single steward, with proper officers under him, trained to the various offices of public agency, and acting under the supreme board, would be able to accomplish all the local concerns of the circle; and such a person might have been found very serviceable in respect of the income tax.”

If a national bankruptcy were on the point of being effected, it might be meritorious to devise a vast increase of useless offices, in order to provide pensions for the more voracious and pitiable sufferers. But under an order of things, which already stifles by profusion of patronage, all tendency to independence among the people, there can be no occasion for more state-parasites. Already the tax-gatherer is frequently bid to call again. Even the richer inhabitants of parishes put off their payments, no doubt in order to keep in countenance their poorer neighbours, whom real want compels to such prostration. New managers must have new salaries; out of what rates can these be extorted without inhumanity? Rather let us calculate which public servants can

be cashiered without detriment, which can be equitably recompensed with inferior profusion. To simplify, not to complicate the mechanism of administration, is the purest pursuit of statistical contrivance.

In all these dissertations there is much repetition, much want of arrangement, much reference to and fro, much vain claim of invention and discovery, much confusion of idea, and much appearance of oscillating conviction, which begins by advising one way, and ends by advising another. Notwithstanding this, the author's self-complacence insensibly gains upon his readers: to be well-meaning is to be deserving; to have toiled for the public is an extensive claim to gratitude.

ART. XI.—*An Enquiry into the System of National Defence in Great Britain.* By JOHN MACDIARMID, Esq. 2 vols. 8vo.

NEARLY half this book consists of speculations about the price of land, the various taxes, the sinking fund, the productive industry, and the national debt of Great Britain; things which may be pressed into connection with the national defence, as might the revolutions of the seasons, and the theory of the weather, but which ought rather to have been separately considered. After ordering a book about the public force, in order to be equipped with conversation for the mess, it is provoking to find it full of the solitudes of the counting-house politician.

Defence—the very word is unmilitary. What occasion has this country for other defence than its navy? Should a legion of invaders chance to land, fury will furnish weapons, and courage, victory, to the people. It is in order to assume our rank among the European nations, that we must train to military skill a larger proportion of our population. Of stay-at-home soldiers, and stationary cavalry, we have enow and to spare.

The influence of a system of defence on morals Mr. Macdiarmid undertakes to discuss in the third section of the second chapter. In the course of this important investigation what are we told—that illness is a vice—that the Athenians thought so—that the Spartans thought so—that the Romans exemplified the fact—under the emperors and under the Popes—and that the reformation favoured industry.

At length come a few observations in point: that military manners relax industry—that they interrupt chastity—that

they favour ignorance—that they encroach on liberty.

Finally, we are informed that heavy taxes operate as temptations to perjury.

The introductory and concluding reflexions may be passed over as irrelevant, but the intermediate matter deserves some extent of commentary: let us first transcribe it.

“If our military system have a powerful tendency to relax the industry of the people, it must have an equal tendency to relax their morals. It is the business of recruiting parties to introduce habits of drunkenness and debauchery of all sorts wherever they go. It is by a taste for these that they expect to unsettle the habits of industry among the young men, and to allure them into the service. It will not be denied that the morals of both sexes suffer equally by these proceedings.

“It is not to be supposed that the morals of those who have been allured into the service by such means should immediately recover the taint, or that the consequences of their vices could be confined to themselves. Our officers call loudly for the institution of barracks, where they may have the soldiers immediately under their own eye. It is with justice they complain that their men, when quartered in our great towns, become uniformly licentious, dissipated, and diseased. Will any one affirm that when a regiment leaves a town it carries the effects of its vices along with it? More women are generally supposed to be debauched by the members of the army than by any other class of men. This is not to be considered as any reproach to them. The members of the army suffer nothing from their fellow citizens, unless in the situation in which they are placed. They would not trifle their time in ensnaring simple

and ill-educated women, if they had any thing better to do.

"Those unhappy persons, who are called the dregs of society, acquire this appellation not less from their uselessness than from their vices. The wives of the soldiers, who come on the parish, are supposed to rank in the scale of morals only a few degrees above the women whom they send on the town. Their destitute children usually discover that tendency to dissolute habits which distinguishes foundlings and parish children. This is to be ascribed to the military system, and not to the parents who are altogether unable to give their children a proper education.

"The army is supposed to be a profession which requires no previous education. Hence it is not unusual for country gentlemen, and the better sort of people in general, to neglect the education even of their younger sons, under the idea that, although they be good for nothing else, they may still find a provision in the army. The expectants of commissions, being thus accounted privileged idlers, spend the time which they know not how to employ, in hunting, fowling, and other amusements of this sort; and perhaps still more frequently in debauches, or in dangle after the equally idle women of the neighbourhood. Whether the habits thus formed are corrected in the army will appear hereafter. But it will, at least, be owned, that the half-pay officers, when thrown back on society, are occupied with nearly the same pursuits as the expectants. They are gentlemen by profession, and are therefore bound to hold in sovereign contempt those means by which other persons better their condition. It is only, however, in idleness that they can, in general, uphold the vocation of gentlemen. The scantiness of their pittance compels most of them to a rigid economy, which does not allow them to partake in the expensive immoralities of the age. In this case they have all the virtue of a compulsory abstinence. Let it not be supposed, that I mean to insult those who are already doomed to wretchedness. It is to the system, and not to its victims, that the demerit is to be attributed. Are unhappy men to be blamed because their education has been neglected by their parents; because they have been abandoned from their youth to idleness and the lures of immorality; because they have been doomed as their only resource to a profession which has barely afforded them the means of subsistence, and inspired them with an insuperable prejudice against every other method of bettering their condition; because they are afterwards thrown on the world with a moiety of this pittance; and because necessity and insurmountable prejudice compel them to wear out the remainder of their existence as an useless incumbrance to society; to breathe the free air in pining and hopeless poverty, or to rot in a jail? Are even the parents of these men to be blamed? Or is not the whole to be charged on a system which abuses both parents and children by fallacious lures?

"I have remarked some incroachments on freedom which seem at least to be apprehended from a perseverance in our present military system. Experience proves that any diminution of the freedom of a people necessarily vitiates their morals. Montesquieu, a most acute observer of men, distinctly perceived this. He informs us that virtue is indispensable in a free government, and altogether unnecessary and extremely dangerous in a despotism. He affirms that even in a monarchy, where the sovereign rules by law, but by such laws as those of France, it is extremely difficult for the people to be virtuous. But Montesquieu was the subject of an arbitrary monarchy; and was therefore obliged to redeem his head by a quibbling distinction between private and public virtue; although he owns that public virtue is the result of the greatest private virtue."

No doubt the diffusion of military manners has altered, and will affect yet more our national character. We shall be gallicized by the change; for the French character in the main is the result of inveterate and extensive military habits. There are certain concatenations of moral qualities which must be taken or rejected in the chain, not link by link; certain inconveniences, which are inseparable from particular excellences; certain vicious excesses, which always accompany the profuse cultivation of the connected virtues. Lord Bacon observes, justly, that "all warlike people are a little idle, and fear danger less than labour; nor must this temper of theirs be much checked if we would preserve their vigour." Let the progress of recruiting officers be observed, it will be found most successful among those who are averse to industry. A given proportion of the males, especially those begotten by the young, are born with the military propensities, spirit, impatience, sensibility to applause, a fickle and migratory taste in places and persons. These lads, when they attempt commercial pursuits, fail in them. Their wages are gone before they are earned. They try experiments in life, and hope by gambling speculations to atone for the neglect of parsimony and perseverance. A long peace overstocks trade with these characters, who do best in the colonies, as explorers of new markets. An East Indian war provides for them to their taste, by building them a palace, or a tomb. Return rich or die, said a wise director to his son who was going out in the company's service. But, although a given proportion of the males, perhaps a tenth, may be said to have the military

predisposition, may expediently be trained to warfare, and employed in extending the empire of their country; it is dangerous to break in upon the natural division of labour, to generalize the manners of military men, to make their pursuits the objects of popular imitation, to inoculate for the scarlet fever, and teach every artisan to carry a musket. Industry is mostly a habit, the result of long coercion and overawing superintendence, which is so agreeably interrupted by pompous parades and crowded festivities, that it is easily bribed to try the experiment of venturous idleness. The veteran of industry makes a bad soldier. Arts exercised not abroad but within doors, and delicate manufactures, that require the finger rather than the arm, have in their nature a contrariety to a military disposition. The sedentary classes lean to sottishness; they are not drunkards, but they habitually use stimulant drinks and drugs: they require this substitute for airy exercise; a sluggish and torpid character of constitution supervenes, ill adapted for fits of effort, subject to the most fatal disarrangement under the enduring privations of actual service, and incapable of being animated into heroism by the gin of the hour of battle. It is easy, as we see by our militia, to debauch away the pupils of thrift, but the state is no gainer by such apostasy; by making soldiers of such men it has only prepared new battles of Zama, or new campaigns of St. Domingo. Those Spartan lawgivers, who are for having us become a military nation, and for educating us all to excel in the military exercises, endanger much more than our commercial arts. Military morals are closely connected with military manners and habits. Spirit must be excited and enhanced in the armed classes by juvenile conviviality. This is mostly followed by a riotous insolence of the men in uniform, by a more irritable sense of honour, and by a multiplication of duels. The military exercises are acquired to most perfection by the young: yet the consequence of convening shop-boys and journeymen at sixteen to the parade is, that habits of dressiness and early libertinism are adopted, which their earnings will as yet not afford to purchase; and that, to supply these factitious wants, the property of their masters is too often rashly violated. General Murat is recorded to have boasted, that in a French army every man was a thief, which was also the case in Sparta: but even in England, where pecuniary probity is held pecuniary

sacred, there is a proverbial suspicion of a tendency in the military taste to respect propriety more than property. There is no honour among honest men, (says the vulgar adage) and no honesty among men of honour. The remedy for this mischief, the worst that is likely to result at all extensively from our new regulations, is to allow pocket-money profusely to the young men for learning the military exercises. With the eager libertinism, the personal elegance and desirableness, the shifting residence, the general celibacy, and the frequent poverty and extravagance of continental officers, has been found connected a tendency to adulterous intercourse. It is well known that in France the marriage-bed was invaded with as little scruple as the tent of the baggage-women; and that garrison-towns were especially notorious for gallantry. Indeed lewdness throughout animal nature is allied to courage: the gelding is a spiritless beast. Religion is not favourable to courage, half its essence consists in inspiring fears of the mind; and the habit of dwelling on prospective solitudes of the imagination is the basis of apprehension, dismay, and panic. *Impius miles* was the familiar characteristic of the Roman soldier: *spernere deos* was of old observed to be a natural concomitant of daring. From those who quibble about a Sunday drill, who expects efficacious resistance to the foe? The priest and the soldier are natural antagonists. Bravery seldom flourishes in a community but at the expence of some tenderness and humanity. Women and priests, who are usually forward in offices of kindness, are supposed to be comparatively inferior in point of courage. Anger is a tearing mangling passion; and, during its paroxysms, cruel: but anger is the regular stimulus of bravery; every general reviles the foe. Those who are naturally most apt to flinch, are naturally most apt to sympathize. There is indeed a reflex sympathy, as there is a reflex courage, brought on by reasoning about our duties, which may co-exist with antagonist qualities: but these are accidents of accomplished natures, not the average lot of ordinary men. Old generals are the mildest but not the boldest. The Russians are the bravest, the hardest, the best of soldiers, but they are not the most humane. Archenholtz says, that in the seven-years war some Russians, who had just lost their limbs, were seen on the ground still to gnaw at the Prussian foe who had fallen beside them. The French

excel in the military virtues, but not in justice and humanity. The Irish are splendidly courageous; they have much humanization to acquire. The Calabrians are the most daring, but the most cruel of the Italians. The Spaniards abound not in courage, but practise benevolence, and so do the Hollanders. Nor are the private lives of distinguished generals, or the public acts of countries, while under the ascendancy of standing armies, at variance with analogous inferences. It may be feared, therefore, that if we were to convene a parliament of drill-serjeants, or implicitly to obey the drill-serjeants of parliament, and to nationalize among our youth indiscriminately the military qualities and excellencies, other qualities and other excellencies of rival or superior value would proportionally disappear: and we should find less religion, less regard to conjugal fidelity, less humanity, and less pecuniary probity in the community than before; qualities which, if insignificant to the power, are not so to the prosperity, or to the happiness of a nation. Semi-soldiers may, and often do, retain the *bourgeois* virtues; but of what avail are such soldiers in an emergency, and of what use before? So long as the defence of the country's independence, which is a paramount consideration, can be accomplished without involuntary enrolment, or as our author calls it, a system of defence, it is more desirable to respect the ancient division of labour, which secured in each department the appropriate skill, to have a military sect than a military establishment; a partial and elective than a universal and compulsory conscription; a decimation than a levy en-masse; it is more desirable to remain a civilized than to become a military nation.

In a chapter on foreign assistance, a command of common-places, and much art of expansion is displayed by the writer, but the advice given is desultory and vague. The great error of our diplomatic politics during the Pitt administration has been to have preferred the alliance of Austria to that of Prussia, because Austria was the more powerful state; whereas the alliance of Prussia, although weaker, ought to have been preferred, because Prussia alone can check the northern aggrandizement of France, in which consists our risk. The friendship of both the German courts at once may seemingly but not heartily be had; because their German interests compel them, or at least habituate them, to rivalry. By assisting Aus-

tria we have always had to fight against the southern aggrandizement of France, which is the form of extension it behoved us to facilitate; had we succeeded in allying ourselves with Prussia, Holland might have been defended against France. An opportunity was lost in 1767 of exchanging with the stadtholder Hanover for the Cape: Prussia might then have taken the electorate, and we the Cape and some spice islands for our indemnity.

The third chapter, which treats of rendering a people warlike, fills nearly a volume. We are here told, "that experience has shown it to be impossible to render even the population set apart for defence permanently warlike, if the rest of the population be effeminate." And again: "there is no instance of a bold, hardy, and vigorous soldiery existing among an effeminate people." What does this writer mean by the word *effeminate*, that he imputes the quality to whole nations, rich and poor? The powers of government are often possessed, perhaps commonly, by the effeminate, the luxurious, the refined, the opulent classes of a community; and such governments are often conducted with a gentle, an obliging deference for the public opinion of the gentlemen and ladies, who visit in the higher circles, which is perfectly polite; but who can form an idea of an effeminate people? When or where did such a phenomenon exist? Wherever there have been men there has always been great inequality. Inequality implies the misery of some. Wherever there is misery, children must be reared in privation, in hardship, in drudgery; and they must grow up with qualities the reverse of effeminate. Misery has hitherto been the lot of the majority of every community at all times; effeminacy can never have infected the mass of families. Effeminate rulers must be common in all countries, where the sway is exclusively intrusted to the aristocracy; France had such rulers, before the revolution, during the greater part of two reigns; but from the moment the authority was transferred to the ruler classes, all the excesses of masculineness broke loose and over-spread the country. Universal suffrage would abolish every symptom of effeminacy even in modern Rome. Military usurpation is another remedy, but a remedy which restores the old grievance (if it may be called so,) in a generation or two. The son or grandson of the usurping general is educated to become an effeminate king. If effeminacy

could become the attribute of a whole nation, it would be proper to institute societies for *worsening* the condition of the poor, in order that a harsher, hardier education might revive the energy of the numerous classes. Nature, wiser than man, proportions the multiplication of the people to their comforts, and thus provides an everlasting supply of scramblers for subsistence, and of temperate hardihood. The prætorian guards were fattened into effeminacy; but, during the deepest declension of Italy, Belisarius could raise there armies which defeated the Goths. By attending to the physical education of the poor, by teaching the games and dances of antiquity, something more of plasticity may be attainable, and a larger proportion of them adapted for fighting men. But, in general, peace rears loose hands (as

they are called) and war educates skilful officers; and if peace and war alternate often enough, neither to check the breed of troops, nor to obliterate the experience of commanders, every country can at all times be provided with a good soldiery proportioned to its populousness. A meritorious chapter on this topic is the fifth section of the second volume, on the circumstances which render a people hardy.

On the whole this book deserves perusal and deserves praise. It is dilute, full of notorious, of superfluous, and of irrelevant matter: it might be epitomized with advantage. But it displays good reading and good sense, it contains counsels of pressing importance, and it breathes a spirit of moderation, of equity, and of liberality.

ART. XII.—*Reply to M. R. Gardiner's Answer to a Narrative exposing a Variety of irregular Transactions in one of the Departments of foreign Corps.* By M. JAMES POOLE. 8vo. pp. 133.

TWO pamphlets relative to this controversy were noticed by us Vol. III. P. 306: this will attract the same class of

readers. We trust and we hear that it is not likely to escape the notice of parliamentary committees of enquiry.

ART. XIII.—*Letters intercepted on board the Admiral Aplin, captured by the French, and inserted by the French Government in the Moniteur: published in French and English.* 8vo. pp. 165.

TO recite the title of this work is nearly a sufficient account of it. The correspondence here reprinted was published in the *Moniteur* in French only. These English letters are not copies of the originals, but versions of a translation; portraits from a bust, not from life. The marquis of Titchfield, who begins with a quotation from St. Luke: 'There went out a decree from Cæsar Augustus that all the world should be taxed,' will hardly recognize his testament again in the Frenchified rhetoric: 'Augustus said, let us place the universe under contribution.'

Beside the variations occasioned by double interpretation, these letters are purposely garbled. In the first a critique occurs of the duke of York's conduct, which the *Moniteur* gave at length, and which the London publisher suppresses.

It may be inferred from the character of the specimens selected for publication, that the French government, at the time of its editing these letters, had determined

to give up the invasion of England, and to undertake that of Ireland. Great care is taken to prepare the Parisians for this determination, by printing at full length every woman's scrawl which described in strong terms the activity of British preparation against the invader; and by bringing out every obscure or scattered paragraph which hinted at Irish discontent. Two letters, those at pages 57 and 58, appear from internal evidence to be forgeries of the French official translator: he must have visited London while we were quarrelling about the representation: for he uses the words *rotten-borough faction*, as if they were still the nick-name of an unpopular party. These letters throw peculiar light on the drift of the publication, and put into English lips what the French public are wished to believe.

The most interesting fragments of this correspondence having already appeared in the morning papers, extracts would be superfluous and stale.

ART. XIV.—*The Works, political, metaphysical, and chronological, of the late Sir James Steuart, of Coltness, Bart. Now first collected by General Sir JAMES STEUART, Bart. his Son, from his Father's corrected Copies. To which are subjoined, Anecdotes of the Author. In Six Volumes. 8vo.*

SIR JAMES STEUART, of Coltness, was the only son of a baronet of the same name (who had been, under queen Anne, solicitor general of Scotland) by Anna, the eldest daughter of sir How Dalrymple: a descent in reality noble, but the diffusive popularity of the clan-names of Scotland gives a twang of vulgarity to their sound, which rarer names necessarily escape.

He was born at Edinburgh October 21, 1712; educated until thirteen years of age at North-Berwick school, and entered in 1725 at the university of Edinburgh. In 1727 his father died; but he continued perseveringly his studies, matriculated in 1729, and was called to the bar in 1735.

Sir James Steuart next undertook a continental tour. He accompanied a fellow-student to Leyden, crossed France, and went to pass fifteen months in Spain, where he received in 1736 the tidings of his mother's death. He visited France a second time on his way to Italy, became acquainted at Avignon with the duke of Ormond, and was by him recommended to the leading friends of the pretender at Rome, in whose society he imbibed a dangerous attachment to the ex-royal family.

In 1740 sir James Steuart returned to Scotland, renewed with lord Elcho a friendship begun on the continent, and in 1743 married lady Francis Wemyss, his lordship's sister, who bore him a son and heir the following year. During the contest for the parliamentary representation of Edinburgh in 1743, sir James Steuart tendered his vote, which, on account of some informality in the record, was disputed: he pleaded his own cause in court with a propriety and an eloquence that piled a trophy over his very defeat.

In 1745, a year of crisis, sir James Steuart was among those who welcomed Charles Edward into Edinburgh; but the battle of Culloden having blasted the hopes of the party, he withdrew hastily about October into France, and settled with his family at Angoulesme. Lady Fanny cheerfully partook, and efficaciously consoled his exile. He visited Paris in 1754, and retired to Brussels in 1755; but finding the place ill adapted for the education of his son, he migrated in 1757 to Tubingen, a cheap German university,

celebrated at that time for skilful professors.

Sir James Steuart had been excepted from the general pardon granted to the friends of the pretender in the statute 20 Geo. II; a distinction honourable to the importance and integrity of his zeal. Thus deprived of a country, he sought in cosmopolite affections a substitute for the patriotic; he mingled in the factions of the republic of letters, defended Newton's chronology against Freret and his coadjutors; vindicated against the author of the *Système de la Nature* the intelligence of the plastic cause; wrote on German coins, and at length proceeded to the composition of his great work on political economy.

The climate of Germany was too inclement for the occasional health of sir James Steuart: in the autumn of 1758 he went through the Tyrol to Venice, and resided with his family for some time near Padua. Lady Mary Wortley Montagu came to delight in their society: she corresponded during four years with sir James, mentions him and lady Fanny with the eulogies due to their accomplishments and virtues, and made some kind efforts to reconcile their sovereign.

With the accession of George III. new principles of favouritism were to begin. In March 1761 lord Barrington obtained for the son of sir James Steuart a cornetcy in the dragoons. Sir James made approaches toward his country, and came to dwell at Antwerp. The French suspected him of a disposition to transfer the intelligence he possessed in their nation to the service of his own; they broke open his house at Antwerp, and seized his papers.

After the peace of 1763, sir James Steuart received assurances, that if he chose to live quietly in Great Britain, he would not be molested for the past. He immediately returned to Edinburgh, and ere long settled at Coltness, his family seat. He published in 1767, his *Principles of Political Economy*, a work of extensive information, which fills two quarto volumes.

In 1771 a pardon to sir James Steuart passed the great seal. Some further tracts on the corn-trade, on the money-circulation of Bengal, on the desirable uniformity of weights and measures, and on Dr.

Beattie's idea of truth, amused, if they did not illustrate, the remainder of his life. An estate was bequeathed to him in 1773 by sir Archibald Denham, which was enjoyed only seven years: his death took place on the 26th November 1780. He was buried in a family vault of the cemetery at Cambusnethan, and a cenotaph built to his honour in Westminster-Abbey.

By publishing this complete edition of his father's works, his son has erected a yet more durable monument to his memory. The first four volumes exactly comprise the principles of political economy. This work is valuable for compilation of fact, for copiousness of argumentation, and for conversancy with the political writers of the continent. It has founded that sect or school of politicians, who wish the state to interfere with all our concerns; who would have government buy and warehouse our corn, government undertake to manage our poor, government prescribe our religion, government select our physicians, and government monopolize our banks. It teaches the antagonist system to that defended in the wealth of nations. According to Adam Smith, *let us alone* is the perpetual prayer of a wise people to its rulers: according to sir James Stuart it is *lend us help*. The one would repeal every law that can be spared; the other would enact every law that can be executed: the one would leave industry free as air; the other shape its vent through jobs and monopolies. If Adam Smith's system tends somewhat to anarchy, sir James Stuart's tends surely to hyperanarchy.

Among clerks of office sir James Stuart is a favourite politician; because his principles go to enhance their consequence, and to multiply the demand for their services: even ministers, being mostly governed by clerks of office, give a practical preference to his system: but his doctrines deservedly want the sanction of our leading statesmen, and of our critical philosophers: they sacrifice the productive to the devouring classes; they paralyze liberty, and patronize inequality.

As writers, both Stuart and Smith are diffuse: they recur much to exposition, and paraphrase, and illustration: with few syllogisms they fill many pages, and place the art of persuading in detaining the attention. But Smith has always a distinct end in view, and travels toward it without digression; whereas the scope of Stuart is often vague, indefinite, and

undistinguishable: Smith draws his inference before, and Stuart after composition. Smith is more neat, Stuart more copious; Smith has more scholastic, Stuart more cotemporary learning; Smith owes all his reputation to his intellect, which will retain its exalted rank; Stuart owes some to his personal consequence, which will vanish with the recollection of his friends.

The new matter of this publication begins with the fifth volume: not but that much even of the two last volumes has already been printed, but in so fugacious, or so local a form of dispersion, that to the literary world it may be considered as new. *The principles of money applied to the present state of the coin of Bragal* can only merit attention on the other side of the Cape. Where a transient, where a topical grievance is to be remedied, the resident authorities should be asked for the prescription. The letter of Mr. Francis displays more understanding of the inconvenience, and a clearer insight of the practicable means of correction, than all the professor-like verbiage of sir James Stuart: to Mr. Francis, lord Barrington ought clearly to have intrusted the requisite active interference.

The Dissertation on the Doctrine and Principles of Money applied to the German Coin is again a pamphlet out of date. A good treatise on this topic is Beccaria's *Trattato delle Monete*.

The Observations on a Bill for altering and amending the Qualifications of Freeholders well deserved to check an intended encroachment on the elective franchise.

The Considerations on the Interest of the County of Lanark, detail in a very amusing manner the effects of the commercial prosperity of Glasgow on the landed interest of the contiguous province. The natural progress of opulence begins in the towns, and thence diffuses itself through the neighbouring country: commercial precedes agricultural prosperity: trade is the substantive, husbandry the dependent, occupation.

The Dissertation on the Policy of Grain constitutes the best, we had almost said the only, literary defence of the extant British policy respecting grain; a policy which we examined at length, and in a manner, we trust, to have produced some impression, in noticing Cursory Observations on the late Corn bill; a policy which raises the price of subsistence a full fourth, and distributes this needless tax, not among the public creditors of the state,

but among the farmers and land-owners, neither of whom have any claim or right to the slightest public recompense, for exercising an interested industry, or for living in unproductive idleness. Beside the interference by means of bounties and prohibitions, with production, importation, and exportation, sir James Steuart recommends the establishment of public granaries; and as his disciples are powerful unfortunately, as well as numerous, in the state, this new mischief may probably be superadded to those already inflicted. We shall transcribe the outline of his plan.

"Let an enquiry be made into prices of grain for twenty years past; let the mean price of it be ascertained. Bounty-money being at present paid until wheat comes to forty-eight shillings per quarter, let it be inquired, whether manufactures do not then suffer too much from high prices. Upon these informations let the legislature determine to what height it is expedient, upon the account of the manufacturing classes, to allow the price to rise.

"Upon the other hand, let an inquiry be made into the interest of the farmers, in order to find when that class generally begins to suffer by too low prices. Let these points be settled by calculation, and from the best information; they may afterwards be corrected from experience during the execution of the plan. For the sake of distinctness alone, I shall suppose forty-eight shillings per quarter to be the beginning of distress upon the manufacturer, and forty-eight shillings per quarter the beginning of distress upon the farmer; the prices between these extremes should, I think, be considered as reasonable, and not to be checked, or influenced, in any respect, by the policy of the country.

"These preliminaries settled, I propose,

"That all corporations, communities, or bodies politic, all hospitals, all manufacturers having the direction of large undertakings, all masters of collieries, iron-works, or mines within the nation; or, taking the thing on a larger scale, all cities, towns, and considerable villages, in which the inhabitants (not employed in agriculture) reside, be severally obliged (as far as the legislature shall judge proper to extend this plan) to make up general lists of their inhabitants, with such exactness as may be judged necessary for the proper execution of it.

"That in proportion to the number of persons of all ages, in each of these different classes, jurisdictions, and districts, a granary be formed, capable of containing eight bushels of wheat for every such person, which quantity I take to be sufficient nourishment for twelve months.

"That the preparing and inspecting these granaries be committed to the commissioners of the land-tax; that these be authorised to

appoint granary-keepers, with reasonable salaries for the management of them, who shall give sufficient security for their administration.

"That the granary-keepers be obliged to receive, from the farmers of the district, such parcels of wheat, of the best quality, as (according to the regulations made from time to time by the commissioners above mentioned) shall be presented to them, at the price of forty shillings per quarter, until the several granaries be provided.

"That there be an absolute prohibition to receive any grain either below or above this standard.

"That, in a year of great plenty, when there may be a competition among the farmers for a preference to furnish the granaries, the commissioners may determine every question between them for the encouragement of tillage, and the inspiring of emulation.

"That no old grain be received, nor any from second hand, when in competition with a farmer of the district.

"That as soon as the requisite quantity is procured, the granaries be shut up and excluded from all competition with the corn-dealers; and while prices fluctuate below that of forty-eight shillings, the grain contained in them be no more allowed to influence the market than it could have done had it been exported.

"That, as soon as the price of wheat shall rise in the respective markets to forty-eight shillings, the several granaries be opened; but with this restriction, never to be allowed to sell in competition with any corn-dealer, farmer, or other, who shall bring grain to market below this price.

"That the granary-keepers shall be authorised to issue, in payment for the grain received, corn-bills, printed for the purpose, signed by them, by the inspector to be named by the commissioners, and by the receiver of the land-tax for the county, which notes are to have a currency in the kingdom like bank-bills, and be payable at the bank. They are to bear no interest while they circulate; but from the time of their being paid, the bank to receive an interest of ——— per cent. more or less, as the legislature and the bank shall agree.

"That one penny in the pound be added to the land-tax, as a fund for paying the interest of the corn-bills paid by the bank, until reimbursement to the bank by the granaries, upon the sale of the grain: which penny in the pound may, I suppose, produce about 40,000*l.* sterling per annum; and this, at 4 per cent. interest, will correspond to the capital of one million sterling, supposed to be laid out in the purchase of wheat, at forty shillings per quarter, which is therefore the price of 500,000 quarters of wheat, destined for the provision of the granaries over the whole kingdom.

"That no person, at least in the beginning

of the scheme, be put upon the granary list, but such as are of the lower classes of the people, manufacturers, labourers, and poor house-keepers, with their children; such, in a word, who may be supposed to be the most essentially hurt by the high prices of grain.

"That proper lists be made at each granary of those who are to be supplied from it, and these in proportion to the grain which shall have been delivered, reckoning one quarter of grain for every person admitted upon the list.

"That, upon opening the granaries, it shall not be allowed to distribute grain to any but to those upon the lists, nor to these above one month's provision at a time, according to the proportion above mentioned, of eight bushels for that of twelve months. This regulation to continue as long as the granaries remain open.

"That, for the ease of the poor, who cannot purchase much at a time, there be markets opened by authority, for the retailing of small quantities, in the same proportion.

"That the money arising from the sale of the grain be put into the hands of the receiver general of the land-tax, in order to be paid into the bank.

"That he, upon making up his accounts with the exchequer, be obliged to produce corn-bills discharged by the bank for the amount of his receipt.

"That the said receivers-general be obliged, at least annually, to report to the commissioners the state of the grain in the several granaries, and the extent of the corn-bills in the hands of the bank.

"That, for the greater exactness, the granaries of each county shall be distinguished by particular numbers; which shall be respectively entered into the granary-book, and be indorsed upon the corn-bills issued by the granary: and when such bills come to be paid at the bank, they shall be entered into books kept for the purpose, according to their numbers.

"Having thus laid down the out-lines of a plan with as much brevity and clearness as I have been able, I must observe, that the small access I have to be well informed as to many facts, has induced me to keep as close to general principles as possible, and to avoid particular detail, which is, however, of the greatest use for rightly forming schemes, as well as for illustrating all political dissertations."

In the first place, the price of grain cannot fall below the standard necessary for the desirable encouragement of agriculture. When corn ceases to repay, with an average profit, the expence of rent, tillage, and delivery, the farmer can convert his arable lands into pasturage, and thus increase the growth of hay, milk, butter, cheese, wool, and similar produc-

tions. Suppose these articles to fall below the price necessary to replace with an average profit the cost of growth, the farmer will decline to hire his land at the old rent. What will then have happened? That the consumers, who are the numerous class, will be benefited by the diminished price of produce, and that the proprietors, who are the few class, will be injured by the diminished price of rent. The farmer's profit will always in the long run be the average rate of profit; but the industrious classes, who are the mass of consumers, will subsist more cheaply; and the idle classes, who are the mass of proprietors, will subsist less conveniently. Industry will have been rewarded, and idleness punished. This is as it should be. More proprietors will in consequence become tillers, and recruit the productive classes; and all objects created by industry will become cheaper, more abundant at home, and more exportable abroad, than before, in consequence of the reduced cost of labour. The diminution of rent is a positive good, to be pursued directly by taxation, if it were not a necessary and natural result of the entire liberty of the corn-trade. The earnings and surplus wages of a society are greatest, when rent is cheap; because more persons work, and the workers subsist on easier terms. It matters not to a community where its food be bought, whether in Yorkshire, or at Alexandria in Egypt, or at Alexandria in North America, so it be bought at the cheapest: the task of importation is itself a source of useful industry: domestic agriculture is most desirably employed in the production of irremovable commodities.

The end to be answered by granting bounty-monies and restrictions on importation and exportation being bad, the forms of offering and distributing premiums for growing corn do not deserve discussion. Yet the plan of founding public granaries is itself one of the worst of those forms. If the state is to interfere, and buy up corn whenever corn cheapens, and to house that corn in public warehouses until it be wanted, this branch of speculation will be snatched from the hands of private merchants, and will by them be abandoned. The purchases of the state will always be proportioned to the cheapness, and not to the probable want of the commodity, they would else be inefficacious; and thus a bounty on production will be given, when a bounty on production ought to be withdrawn. The sales of the state will be profuse, in proportion to the

dearth, and not to the probable deficiency of the commodity; else they would be inefficient for their end, which is to level prices; and thus a bounty on production will be withdrawn, when a bounty on production ought to be given. But in the hands of private merchants depreciation takes place in proportion to the stock reserved for immediate consumption; and appreciation takes place in proportion to the deficiency of that stock; and thus growth and importation are invited at the right moment, versatile culture and exportation are stimulated at the right moment. To say nothing of the corrupt contracts, and careless stowage, and profligate waste, which attend public stores.

Leave the corn-trade to itself, and rising markets will invite, and falling markets will repel, private capitals from this line of enterprise. Employ government-buyers, and the capitals invested will be always the same. But it is obviously proper that, during the rise of produce, the capitals employed to put agricultural industry in motion should be increased, in order to cause a more extensive growth; and it is obviously proper that during the fall of produce the capitals employed to put agricultural industry in motion should be decreased, in order to check a superfluous growth. Private interest therefore operates aright, when public providence would operate wrong. Holland enjoyed during the last century an unrestricted exportation and importation of corn; she had no state-granaries, yet the price of corn was there less fluctuating than in England, and though she grew little or no corn, she was the cornucopiæ of Europe. Experience has confirmed the theory of Adam Smith in contradiction to the theory of sir James Steuart. See also our third volume, p. 306.

The *Plan for introducing an Uniformity of Weights and Measures* deserves some attention. We are of opinion that governments cannot legislate very decisively on the subject. The weights and measures of the most commercial nation are always tending to generalize themselves. The motive for legislating is to spare the labour of translating into new figures the weights and measures already noted. The trouble of change is itself a grievance. It might be worth while to incur this trouble once for all, if each nation would concur in the same new standard. But for a single nation to make the change is to increase the grievance for no purpose. The best standard is not yet agreed. The

decimal divisions of the French lessen the arithmetician's labour, and may therefore be welcome in the counting-house; but they increase the difficulty of subdivision; quarters become fractions instead of integers, and thus the retail dealer and the vulgar reckoner is put to greater inconvenience. The French have returned to the twelve-hour day; they will probably return to the sixteen-ounce pound. Coins are most easily changed, a decimal division of coins has been found convenient at Naples; yet the metre-mongers of France chose to leave the coin unchanged. Nor have the poets deserted their Alexandrines for decasyllabics. The Greek jargon of science is ill adapted for a vulgar nomenclature; yet denominations common to all languages are as important a condition of the best weights and measures, as the universal intelligibility of arithmetic cyphers. There is this advantage in diversity: that it intercepts a precise estimate of profit, which ought to vary with the demand of a given place, but which could not vary without odium, if buyers were easily aware of the cost elsewhere. The profit of a druggist ought to be higher than the profit of a grocer; his trade requires more skill, and returns his capital less expeditiously; yet they both sell in many instances the same articles. Force on them the same weights, and the druggist will be reviled by the populace for his extortion. It is wise to ask why things are, before we vote for making them otherwise.

The *Observations on Dr. Beattie's Essay* certainly deserve the perusal of those who think Dr. Beattie's Essay worthy of perusal.

The *Critical Remarks on the Systeme de la Nature* have the higher value of attacking a superior book.

The Defence of Newton is curious for having been composed in a foreign language; not so, for erudition; not so, for sagacity.

A translation of this Defence terminates the collection of sir James Steuart's writings, which deserve to become a library-book, and to be consulted for information often, for inference seldom. The style is rather European than idiomatic, but has more purity than was to be expected from so habitual an absentee.

In Mr. D. William's *Lectures on Political Principles*, the character of this writer is given in an oracular but imprecise manner. 'Sir James Steuart (he says p. 247), the most profound and original of all

Writers on political subjects, has collected information and formed conceptions with great anxiety and labour: but he produced his thoughts as they occurred; and he had nearly forgotten his native language. He is the miner who plunges into the bowels of the earth; while Montesquieu and Hume are amused with appearances of hypotheses on the surface: but he leaves the ore mingled with dross. Dr. Smith has formed some of it into metal: inferior authors have stolen pieces unobserved; and financiers, or the secret prompters of financiers, occasionally avail themselves of his skill. The general mass remains to be explored by some congenial spirit; who, it is to be hoped, will do justice to his memory while he profits by his labours."

We do not accede to the assertions that sir James Steuart is very profound or very original: he only looked around him for the books whence his materials are drawn,

not into the deep wells of antiquity, or into the chosen sources of intellect. He has collected information and formed conceptions with great anxiety and labour. He may be compared with a miner, whose exploits respect but ordinary ore, and who disinters copper of lead, while Montesquieu and Hume are delving for sparkling crystals or pure silver. Adam Smith is greatly indebted to Hume; but not so to sir James Steuart. Adam Smith had a clear head: what he writes is necessarily intelligible. But sir James Steuart has often permitted himself the use of jargon; and has written many pages (as concerning the distribution of taxes into proportional, cumulative, and personal) which neither he nor any of his readers can ever have understood. The obscurity arising from muddiness by concealing the bottom may pass for profundity: but to such obscurity the great writers never recur.

ART. XV.—*The Policy and Interest of Great Britain with respect to Malta summarily considered.* 8vo. pp. 160.

FIRST occurs a disquisition on the value of Gibraltar, next on that of Minorca, and thirdly on that of Malta. All these possessions supply the British minister with pretences for patronage; and facilitate the lodgment of troops within reach of Spain, Italy, Greece, Syria, and Egypt, into which countries the inroads of French armies have occasionally extended. They offer therefore a readier mean of thwarting French enterprizes, than we should possess without these hills of stone.

Our politics are often antigallican to absurdity. British ministers think it their duty to oppose the undertakings of the French, even when those undertakings interfere with no British interests. If France must aggrandize herself, it is better she should do it southward, than northward; toward the Mediterranean, than toward the Baltic. During the antijacobin war, if the overflow of French force had been quietly tolerated in over-spreading Italy, Greece, Syria, and Egypt, two of these countries, Italy and Egypt, would at first have been undividedly annexed to the French empire. If our efforts had been wisely reserved; and wholly bent on the defence of Flanders and Holland, neither of these provinces would have easily become subject to France. How much more advantageous to this country it would have been, if the peace

of Amiens had so allotted them! The French general intrusted with the government of Egypt, would by this time have rejected the sovereignty of a Parisian upstart; and would have been now courting our alliance to render Egypt independent: and Italy, consolidated by a conquest, would not despair of recovering a substantive independence, in concert with Switzerland, and with the aid of Austria and Britain. Half the enterprizes of our antijacobin ministers were made in our own wrong; and could only serve to restrict the French within retainable limits. The very difficulty which Malta opposes to the acquisition of Egypt by the French, is likely to be the cause of annihilating the Austrian power, by compelling the pursuit of extension along the middle zone of Europe.

This treatise displays historical and topographical knowledge of Malta, and probably originates with some of those placemen, who are distributing the benefits of British administration among the late subjects of the knights; it does not display, but it may purposely conceal, nautical knowledge; or the inutility of the island as a naval station would have been frankly avowed. As a piece of argument this work is ludicrously feeble.—Observe the following passage:

"I hold it no temerity to affirm, that a cautious, enlightened, and adequate con-

sideration of this great question will produce an answer, comprehending the following propositions; viz.

"1. That it is indispensably necessary that Great Britain should employ the most efficacious means that she can devise, to guard against the possibility of France ever again acquiring possession of Malta.

"2. That, consistently with that object, and in necessary course to its attainment, it is indispensable that Great Britain should establish the permanent presence of her power at some secure, and *insular*, position, within the Mediterranean.

"3. That the most simple and convenient, and, at the same time, the only certain and effectual mode of attaining both these ends, is, that Great Britain should remain in possession of Malta."

Here, in order to guard against France's acquiring Malta, Great Britain is advised to occupy a Mediterranean island, and that island Malta. This is arguing in a circle, and treating identical propositions as inferences from one another.

The most valuable part of this treatise is that which defends a passage in his Majesty's declaration or manifesto against France, by endeavouring to shew that the order of St. John cannot now be considered as the body to which the island of Malta was to be restored. Where a something so very like bad faith has sullied, as the French assert, the public conduct of Great Britain, one is eager to catch at the most plausible defence of the proceedings arraigned. We solicit the historian to weigh the grounds of defence here adduced: many of them are entitled to his acceptance and repetition.

A passage which indicates ambitious views in our governors is the following:

"Whether the secret wish of his (Buonaparte's) mind be, to attempt a rapid operation for reaching our Indian empire; or whether he is prepared to prosecute that

object by a more tardy and lingering process, or whether those views are, for the present, absorbed in the immediate purpose of reviving the natural fertility of Egypt, and converting its immense dormant resources to the aggrandizement of France; by creating a colonial system, surpassing, in productiveness and security, all that our American islands can aspire to; which ever of these be the governing purpose of his mind, (though it is most reasonable to suppose that they are all combined in it), we are infinitely concerned in being early prepared to disappoint and frustrate it. And nature has provided no means by which we can possibly accomplish this, but by occupying Malta; which island, with its dependencies, she seems to have formed and prepared to become, in these latter days of general change, violence, and exertion, the representatives of the *Britannia Insula* within the Mediterranean.

"But, in enumerating the *political* powers which we derive from the occupation of Malta, we are not to overlook a most efficacious *moral* power; of which we likewise became possessed, the moment that the genius of Britain, the evil genius of Buonaparte, first took post upon that island. Already has his empire of darkness suffered molestation from the proximity and splendour of truth; the rays of which, diffused from the centre of Malta, have cast their light upon the opposite coasts. Already the illumination of a free press, discreetly used, and judiciously directed, has begun to dissipate the mists of error and deception which enveloped that wide horizon.* Already the system of falshood and deceit, by which the tyrant governs the minds of his subject nations, has experienced some counteraction from that efficacious engine; and he himself, and his tyranny, stand now fully exposed to the public view of Italy, of Greece, and the Levant."

It is a puny ambition to possess a few rocks, which can at best serve as an orangegarden: the Cape and the river Zaire are worthier objects of culture. What Carthage coveted, we may disdain.

ART. XVI.—*Thoughts on the Protestant Ascendancy in Ireland; with an Appendix.* 8vo. pp. 108.

SO long as the church of Rome and the church of Constantinople agreed in religious doctrine, their common creed had a right to the denomination of *catholic*, or universal; because it was, in fact, the only recognised and established form of christian confession. But as soon as the

Greek and Latin churches began to marshal under their respective patriarchs and popes, and became distinct sects, the term *catholic* ought to have been dropped.

The notorious corruption of the Nicene creed, by the insertion of the words *Filioque*, began at the council of Toledo, in

* "For several months past, an Italian paper has been published weekly in Malta, the object of which may be inferred from what is here said. This paper, actively distributed in the Mediterranean by the opportunities which our naval superiority must ever command, is perused with avidity, not only in the islands of Greece, but on the coast of Asia Minor, and at the regencies upon the coast of Africa."

Spain, under king Riccardo, in the year 589. This additional clause can be traced, as already accepted by the Gallican church, in 791. At the synod of Frankfort, in 794, this innovation was superinduced on Germany, and from the time of the coronation of Charlemagne, it may be considered as having become the orthodox doctrine of all that portion of christendom, which recognised the spiritual supremacy of the Pope of Rome.

The Roman catholic faith, which differs from that of the ancient church, by maintaining the *two-fold* procession of the Holy Ghost, is, therefore, but a modern heresy, first established in the year 794; and has prevailed in Europe only during about half the interval that elapsed between the foundation of christianity and the reformation. The bishop of Orleans, Theodulfus, seems to have been the person through whose zeal the power of Charlemagne was moved to convene those councils, which established this recent and double genealogy of the Spirit; he is, therefore, the founder of the Roman catholic sect; the proselytes to which might fitly be termed, in ecclesiastical history, Theodulfians.

About seven hundred years later than Theodulf, flourished Bucer, who was consulted by Archbishop Cranmer concerning the alteration of the English church, and who appears to have defined those articles of faith, which are now held sacred from the Tweed to the Channel. Ireland was first converted by the Theodulfians, and next undertaken by the Bucerists. Four-fifths of the inhabitants repeat the shibboleth of the one sect, and half the remaining fifth of the other: about a tenth are Calvinists. The Bucerists have attempted to draw the Calvinists into their alliance, and, under the common name of *protestant*, to advance a claim of *ascendancy* in Ireland. Assisted by the civil power of the British government, this arrogance has been so successful, that the tythe is collected over all the lands of Ireland, for the exclusive benefit of the priests of the Bucerists. A decimal fraction of the community has contrived to confiscate, for the benefit of its own peculiar priesthood, one-tenth of the annual produce, which is equivalent to the *sesquialter* of one-sixth of the whole territory of Ireland. This has been accomplished and maintained by the forcible introduction and execution of penal laws against the celebration of mass, and other innocent actions of the priests of the Theodulfians (which laws have lately been

withdrawn), and by the exclusion of their laity from offices of magistracy, honour, and profit (which exclusion still subsists). Under Elizabeth, and at the instigation of the Bucerists, one hundred and thirty priests of the Theodulfians were executed at Tyburn, and elsewhere, for no other crime than the inculcation of their tenets: so extensive a destruction of priests never accompanied any other persecution, except that by the late atheistical revolutionists in France. Under Charles the First, North America was stocked with the exiles of a less murderous, but not less extensive persecution. Under Charles the Second, two thousand Calvinist priests, who had been inveigled by the Bucerists into temporary alliance, for the sake of accomplishing the restoration, were, with the most ungrateful perfidy, ejected from their benefices, and had their private property, in the revenues of the church, totally confiscated, without indemnity, by an act of uniformity. What was thus done against the Calvinist clergy was extended, under William the Third, to their laity. Corporation and test acts were introduced, in order to deprive their adherents of all political influence. They yet labour under the same grievous privations as the Theodulfians. During the reigns of George the First and Second, a philosophic party gave the tone to our statesmen; the spirit of the hierarchy slumbered; Ireland was tranquil, and Britain happy: but the opportunity was lost of removing the legal infringements on the political equality of religious sects; and the evils of intolerance were all to be renewed during the ensuing reign. Every one recollects how much the rebellion of North America was embittered by the apprehension of being visited with episcopacy; and how much the rebellion of Ireland was occasioned by the refusal of catholic emancipation. Two civil wars is a high price to have paid for our docility to this clergy.

Our author, after dwelling at considerable length on these grievances, makes the following specific proposal:

“What I should, therefore, advise is, that government should, without delay, remove all the remaining disqualifications and restraints on account of religious opinions; should substitute a political instead of a religious test, and endeavour to make the people forget that a contrary one had ever been imposed. There should be no distinctions retained, and it is the interest of the state to promote the most entire oblivion of those which formerly

existed. The effects of these measures will be, to give consequence and consideration, where there is already property and character. It will be a cheap purchase, for the government will buy the support of a numerous party of the rich and respectable, at the expense of what it has no claim now to retain. It will be selling what is of no utility, for what is above all price. The Catholic landholder, merchant, and peasant, will derive an additional motive to maintain, at the hazard of their existence, the security of a government, the latest actions of which entitle it to their gratitude and love. 'These,' says Mr. Burke, 'are chains that, though light as air, are strong as links of iron.' This repeal, while it joins the two persuasions in power, will unite them in affection. All the talent (and in what country is there so much?) will then be employed on the side of the state, at a period when all that can be brought forward ought to be called into action.

"The next consideration will be, to provide for the support of that religion which it is thus proposed to admit into our establishment; and in so doing, the object should be, that the burden imposed upon the people for the purpose of obtaining the necessary funds, should be no more than just sufficient to enable every man, with decency and comfort, to live by his ministry. The Irish government allows, at present, salaries to the ministers of the Presbyterian worship. There seems to be no reason why the same indulgence should not be granted to the Catholics. Policy, as well as justice, demand it. A small, but independent hierarchy, ought to be established. Supposing the parishes to

amount to 1200, allowing a salary of 100*l.* per annum to each resident priest, and 400*l.* to each bishop, the amount of the whole establishment would be less than 160,000*l.* per annum: an ecclesiastical establishment not of a very splendid nature, but perhaps sufficient for the moderate wants of the Catholics, and conformable to the principles, not of encouragement but of toleration, on which it is proposed to acquiesce in their demands.* This establishment, when compared to the Protestant, which exceeds half a million, furnishes a proof, at how cheap a rate an institution of so much importance can be purchased. The Catholic religion now existing in Ireland, under all the disadvantages of penury and contempt, is still equal to the maintenance of public morals, and to the support of Christianity. The numbers too of the two sects, are of some consequence. The Protestants of the regular church do not exceed 600,000 souls, and their establishment costs the whole nation half a million. The Catholics amount to three millions of people, and they would be amply contented with the payment of 160,000*l.*"

Two objections to this plan deserve notice.—Why introduce a political test at all? Cannot a republican be a good magistrate under a monarchy, and a royalist under a republic? Harmony of speculative tenets is no more necessary in political than in religious theory. Coalitions of hostile factions have often governed well; experience justifies the joint employment of disagreeing dogmatists.

ART. XVII.—*Serious Examination of the Roman Catholic Claims, as set forth in the Petition now pending before Parliament. By the Rev. THOMAS LEMESURIER, Rector of Neunton Langville, late Fellow of New College, Oxford.* 8vo. pp. 60.

THE descendant of a French refugee may be allowed to feel some hereditary prejudice against the church, which procured a revocation of the edict of Nantes: but if this prejudice has so far abated against its doctrines, as to allow of conformity to an establishment, which Calvin accused of papism; and has so far abated against its practice, as to allow of a defence of that very intolerance, which protestants once ascribed to the clergy, as Romanists, and not as tithing-men; this prejudice can have little claim to indulgence, or to excuse: it borders on an ignoble apostasy to the creeds and the cruelties which his ancestors withstood.

The Rev. Mr. Lemesurier first analyzes the catholic petition, which in his opinion (p. 10), 'does not state the case of the petitioners with that clearness and precision which is or ought to be required.' This is a new ground for resisting the prayer of a petition, that it was not drawn up by a neat writer: happily this ground of objection is still more applicable to the reverend gentleman's own counter-prayer.

He next compares the qualifications required of an Irish Roman Catholic, which are affirmative or juratory declarations of opinion, with the qualifications required of a member of parliament, which are pe-

* "I have selected this sum in preference to a larger, because in the reformation of English curacies, laudably commenced by the English bishops, 100*l.* per annum was esteemed a competent provision for an English clergyman. The Scottish ministers are supposed to enjoy, upon an average, nearly the same sum, independent, however, of a house and glebe of ten acres."

uniary or territorial possessions: and asks, (p. 13) whether there be more injustice in imposing the one than the other. This is an Oxfordism: the doubt could hardly have occurred elsewhere. It may there be customary to weigh subscriptions and adjurations to articles of faith, against pecuniary income and territorial tithes; and to consider the imposition of the one as no grievance, when accompanied by the concession of the other. But ecclesiastical morality is not always that of the world. Among laymen want of veracity is a disgrace, and poverty is not. The man of honour in practical life feels a reluctance at making formal and public assertions of opinions, which have never been examined, or never understood, or never proved to the satisfaction of the asserter. He feels no reluctance to acknowledge or declare the want of a landed estate. Both inquisitions are cases of impertinence and injustice; but the one violates the conscience, and the other only the pocket.

Thirdly, the oath of supremacy is defended. It denies jurisdiction in matters spiritual to all aliens. If the presbyterians of the continent were to hold a synod at Geneva, for the purpose of determining anew the canon of scripture, and were to transmit exhortations to the kirk of Scotland to admit the Wisdom and the Ecclesiasticus into the christian canon; any attention to the authority of such council would be a violation of the duty enjoined by the oath of supremacy. It is therefore an oath not quite fit to be imposed even on protestants, far less on catholics.

Fourthly, this author has recourse to what he mistakes for alarming language, and calls out in his panic as follows: (p. 45) 'What shall we say further to a popish chancellor, and a popish prime-minister, disposing of all the dignities in the church, and of the cure of souls in such a large proportion of our parishes?' Shall we not say, po! pish! If Bolingbroke and Burke, who were catholics born, had been prime-ministers during the principal part of their political career,

would this country have been worse off than under the men who overbore, or superseded them? Would literary merit have been less secure of advancement in the church? Lord Chatham, the best of our prime-ministers since the revolution, was a notorious despiser of the church of England, and he reviled its ordinances in parliament. The purest churchmen, such as Lord North and Mr. Addington, have been sorry ministers of state.

Fifthly, the intolerance of the Roman Catholics is adduced as a reason for withholding toleration from them. If a great number of whites were slaves in Tombuctoo, oppressed by their masters and grievously abused, would it be less a duty in the negro monarch to introduce milder laws and progressive emancipation, because, in some western islands, precedents had occurred of white tyranny? Be tolerant to the catholics, that they may feel the superiority of your religion in the very generosity of its sway. To find a precedent for the sin of intolerance, is not an apology: the retaliation of injustice aggravates it; the pernicious consequence being, in the second instance, foreseen. Besides, what claim would the Bucerists themselves have to toleration, if ancestral persecutions were to be visited on posterity? Recollect that Queen Elizabeth put to death one hundred and thirty catholic priests (see the list in our third volume, p. 282), for promulgating their religion in England. These things must not be repeated against the intolerant party: not only his church, but M. Lemesurier himself, might be in danger; and we wish him many happy years.

This pamphlet concludes with the assertion, that the granting of the Roman Catholic Petition at this juncture leads to no less than the total destruction of the country. How the repeal of a law can destroy a country, we know not: perhaps the author believes that miracles have not ceased, and that saint Calvin and saint Bucer will sink under sea Scotland and England, whenever their people become ashamed of bigotry and persecution.

ART. XVIII.—*A Letter to Dr. Troy, titular Archbishop of Dublin, on the Coronation of Bonaparte by Pope Pius the Seventh.* By MELANTHON. 8vo. pp. 97.

OF the spirit of this pamphlet the following sounding denunciation will give a just idea:

"From among the thousands and ten thousands of christians, impressed with these sentiments, and terrified and appalled by his por-

tentous conduct, I stand forward as the public accuser of his holiness—I stand forward to arraign him in the face of heaven and of earth—In the presence of men and of angels, I charge him with a flight of impiety and blasphemy, beyond all that the most audacious abusers of the Most High have ever attempt-

ed; with an extreme of insult to the Supreme Ruler of the universe, that has, as it were, been reserved for the last outrage on his patience and forbearance, in this age of unparalleled apostacy from all religion, and for a characteristic winding-up of that horrible revolution, which laid its foundations in the temporary extinction of the religion of his blessed Son, and now braves heaven by the mockery of restoring that religion, only to outrage and profane it.

"In all the horrors of this revolution, I charge him with having made himself a party. In all the horrors of this revolution, I charge him with having made our God, and our Redeemer, and our Sanctifier, parties, as far as his assumption of the divine commission, with which he invests himself, can accomplish so impious a purpose.

"It is the authority of the Most High which he pleads; it is the sanction of his commission of which he makes his boast; it is his highest prerogative in governing the affairs of men, that he pretends to exercise, while he confers the imperial crown, the price of all the enormities to which the French revolution gave birth, on its most distinguished parricide, and anoints with the holy oil of kings the merciless hands that sluiced the most innocent blood during its exterminating progress.

"It is in the name of the immaculate Jesus, and with the invocation of the Holy Spirit, that he consecrates a sceptre, wrested from its legitimate possessors by a series of such atrocities, flowing from this revolution, as never before stained the annals of human crimes, or drew down the curses of heaven on the human race.

"It is the blessed Son of God whom he associates in the filiation * to which he admits a recorded apostate, who in the face of the christian and infidel world, and by a public proclamation sent into the world with his signature, while commanding the revolutionary armies in Egypt, asserted that God had no Son, no associate in his kingdom.

"It is to the grace of God, poured largely into the heart of this ferocious homicide, who by a more insatiate thirst of blood, and a pre-eminence in every revolutionary crime, eclipsed the fame of all his revolutionary competitors, that he ascribes the desire to receive the imperial crown, the golden fruit of all these crimes, from the hands of God's vicergerent and representative; and it is to the immediate inspiration of heaven, in answer to his own fervent prayers, that he attributes his determination to gratify this desire of his most 'clutiful son,' who now professes to be a catholic, as, when it answered a revolutionary purpose, he professed to be a Mahometan, and who now venerates the *health-bearing cross*, as he then venerated the *health-administering Kottan*.

"With respect to the high station he fills

as head of the Roman catholic church, seated in the see of the prince of the apostles, and, as his successor, venerated, I might say adored, by such a portion of the christian world, I charge him with having betrayed its dignity.

"He canonizes as the pious and zealous protector of that see, the man who made a merit with the people of Egypt, that he was the servant of their prophet;† a Mussulman, who had marched to Rome to overthrow the Pope, because he invited the christians to make war against the mahometan religion.

"He recognizes with the warmest effusions of gratitude, the most rapturous expressions of joy, the man who waged a war of extermination against his immediate predecessor in the pontifical chair; who plundered him of all that the zeal of christian emperors and princes had lavished on his see; who cast him into prison, loaded him with contumely, and at length, by his cruel treatment, and the ruin he brought upon the patrimony of St. Peter, as well as on the whole catholic church, broke that truly pious, upright, and venerable pontiff's heart, and brought his grey hair with sorrow to the grave.

"To the royal family of France I charge him with the foulest ingratitude. He takes the crown of St. Lewis from the altar on which, by an eternal decree of Boniface the Eighth, his name was for ever to be invoked, and places it on the head of the murderer of his descendants.

"In the throne that had been filled by this race of kings, who for so many ages had been sanctified as the eldest sons of the Roman catholic church, the founders of all its temporal power, the liberal benefactors to whom the see he fills owes all its princely possessions, he seats the upstart usurper of their birthright, the plunderer of their inheritance, the tyrant who founds his power on their extinction.

"These are the charges I bring against this father of the faithful, this visible head of the church of Christ, this vicergerent of God. It is not a tale of old times; it is not a transaction of ages of ignorance and superstition, to which we scruple to give credence, as so dissimilar to all that the principles and feelings to which we are habituated can suppose possible: it is the act of the hour in which I write:—enlightened Europe is witness to it—the astonished and indignant world bears testimony to it. Stand forward, you who exercise the office of advocate for this delegate of heaven; stand forward, and in the face of your country defend him against these charges. Stand forward, and exculpate him to the numberless professors of your own religion, who hang down their heads in shame and silence, and to the whole body of your protestant fellow-subjects, whose indignation I but faintly express."

In our opinion, the pope has acted con-

* His dearly beloved son in Christ. See the *Allocution to the secret Consistory*.

† See his *Proclamations*.

sistently with the practice of his church, with the law of nations, and with the principles of morals, in crowning Bonaparte.

The catholic church does not interfere with any other title to sovereignty than faith. She always prefers the orthodox upstart to the heathen heir, and crowns without hesitation a Constantine or a Pepin, or fulminates without hesitation a Julian or an Elizabeth, whatever be the character of their civil claims to sovereignty. It is a proof of the forbearance and long-suffering of the catholic church to have tolerated the Bourbons so long. Both Louis XV. and Louis XVI., instead of repressing and persecuting the encyclopedic heresiarchs, connived at their impieties, extended legal toleration, and appointed deists and protestants to leading offices of the state. It was conformable to precedent, that under sovereigns so dangerously liberal (compare the conduct of the priest Savonarola under Lorenzo dei Medici), a Sieyès or a Gregoire should let slip the arguments of sedition, as a wholesome corrective, in order to teach the throne its dependence on the altar. The church well knows what Barruel teaches aloud, that a triumph of sedition is the school for kings; and that the magistrate only patronizes her jargon and her pantomime for the sake of the obedience which she knows how to inculcate. The directory of France was antichristian: it was correct therefore in the catholic ecclesiastics of France to transfer their allegiance to Bonaparte, who was a professing christian at least, and is probably a sincere one. The Egyptian proclamation drawn up by his staff of *savans*, and no doubt signed unread, proves nothing as to his personal religiosity: if it proved secret infidelity, there would be more glory due to the church for bending the stubborn neck of that courage which has doubted, than for keeping in curb the cowardice of habitual superstition.

The extravagant doctrines of the English Tories concerning the indefeasibility of hereditary claims, and the imprescriptibility of royal titles, form no part of the law of nations. Right is power recognized by others. Might becomes right, as soon as a formal acknowledgment to that effect intervenes. After the peace of Ryswick, the rights of James the second to the throne of Great Britain were, as far as respected the rest of Europe, at an end. During the ensuing peace, it was a breach of etiquette in French writers to call him king:

and, during the ensuing war, it was in the French nation a recision of their own agreements, and an arbitrary unconsented revocation of implied compact, to assist James in 1715, as entitled to the British crown. Not only Vattel, Martens, and Günther, support this doctrine; but the French themselves, in their declaration of war against the emperor, in 1733, complain thus:

'L'Empereur a entrepris de prononcer sans autorité sur ce qui s'était passé dans l'interieur de la republique de Pologne.' They admit that a foreign power is never competent to pronounce concerning internal rights; and consequently that domestic recognition ought always to involve foreign. The pope therefore acts conformably to the law of nations in recognizing as sovereign of France the object of French recognition.

And now to the principles of morals. When could anarchy terminate if the claims of the expelled were perpetual? Who does not see the absurdity of treating as valid those claims of the Irish peasantry over lands whence their ancestors were ejected? If such claims were unexpirable (and the claims of ejected princes are of the same kind), each generation must fight anew for the whole mass of fixed property. For fields of harvest we should have fields of battle; for furrows, graves. In matters of domestic legislation, the law can efficaciously limit the exact date of prescription; because society can call in the mass of possessors to support its definitions of title. But in questions of the law of nations, there being no executive police to employ, it is expedient, and therefore just, that prescription should be coeval with recognition. If the European powers made no bargain at the peace with the French government about the forfeited property of the emigrants, that property must remain a valid forfeiture. If no reservation was made of the rights of the house of Bourbon (and Bonaparte would not have treated as the occasional sovereign), those rights have been virtually resigned; and it would be ungentlemanly, and a breach of honour, in any member or minister of the British house of commons to propose now to re-enact them; no single nation, no confederacy of nations, can have a right to declare them valid. As it is no object to the community whether an estate be held by John Doe or Richard Roe, provided there be no uncertainty about the proprietor; so it is no object to the commonwealth of

nations, whether a reigning dynasty be called Capet or Bonaparte, provided there be no doubt about the real sovereign. The friend of order therefore is to promote the ascertainment, not the litigation; he is, like the pope, to corroborate the decisions of international lawyers with the over-awing sanction of the mother church.

The pope is the representative of the catholic interest; he promotes that interest by crowning Bonaparte; he thereby reconquers to the Romish church the most powerful of the European kingdoms. Compared with this conversion of millions, and of their sons' sons, to the holy see, what are the puny interests of a family heretofore royal? The pope would

have been a traitor to his office to have acted otherwise.

We advise this trumpet-tongued declaimer to lay aside his passion, and to re-examine the argument at issue; he wants that power of voluntary transmigration, without which the merit of party-chiefs can never be equitably appreciated. It became the duke d'Eughien to die for the traditional rights of his family: but, in recommending a *qu'il mourut* to the pope, impropriety is advised: he had to perform the humbler duty of *living* for the catholic church, and of crowning its restorer. A pope is not bound to die for Monsieur, but only for the church of Christ.

ART. XIX.—*Cockburn's Dissertation on the best Means of civilizing the Subjects of the British Empire in India.*

THE Rev. Claudius Buchanan, vice-provost of the college of Fort William in Bengal, gave in 1804 two hundred guineas to the University of Cambridge as a prize for the superior English prose dissertation, 'On the best means of civilizing the subjects of the British Empire in India; and of diffusing the light of the christian religion throughout the eastern world.' The question is studiously so put as to admit but one answer—'endow churches.' Civilization may be best extended by the missions of commerce; and christianity best taught by the distribution of printed instruction, which can be accommodated to the languages of different provinces; but if the same engine is to be used for manufacturing such disconnected products as civilization and christianity, that engine must be an ecclesiastical corporation. Where the inference is prescribed, the philosopher will disdain to discuss; but there are men in modern times, whose ductile eloquence can always labour to popularize the very inferences of their patron; whose obedient souls aspire, as after a merit, at driving in the rut of prescriptive orthodoxy, and whose accommodating reason can always evolve the very creed of the cotemporary magistrate.

After noticing many peculiarities of the Hindoos with reprobation, the author proceeds to his main proposition.

It appears absolutely necessary that a church-establishment be immediately commenced; and at page forty-one it is further recommended that a bishopric be endowed in Bengal.

When this bishop and these clergy, of the value of whose importation only the wicked and the ignorant can doubt, are

arrived in Hindostan, what are they to do? They are to disperse a partial version of the scriptures.

And thus, that mass of fanatical and ignorant absurdity, compiled by bishop Newton from popish and mystical theologians, which corrupts every source of history and confounds every faculty of judgment, and with a perverseness at which Mr. Halded would blush, holds up, as prophetic and allusive, a multiplicity of passages in the scriptures, which have not the slightest pretensions, which lay not the feeblest claim to a prophetic character, is to be dispersed among the Hindoos, as a part of christian religion. Is this to diffuse light, and to scatter civilization?

The various forms of christianity, while they subsist as sects, feel out their appropriate public, and serve to define the moral and intellectual attainments of their respective adherents: but, in an unopposed established shape, they have never yet been decidedly beneficial. From the establishment of christianity under Constantine, to the beginnings of its disestablishment under Pope Leo X., is the darkest and most uncivilized period of European society. Shall Britain prepare such a millennium for Hindostan?

This author is not unwilling to learn of the enemy. Among the causes of the propagation of christianity, he reckons (p. 31.) in the words of Mr. Gibbon, 'the exclusive or intolerant zeal of the christians.' With such views of fact, the determination to succeed cannot but be accompanied with the use of exceptionable means. Among those already suggested, is a proposal to call in the aid of the civil power (p. 27.) to abolish the

custom of sitting in Dherna ; and another proposal (p. 28.) to abolish the custom of erecting a Koor. These practices perhaps thwart, in some cases, the administration of justice : if so, let the courts of law, in their judicial capacity, interfere : but if the suppression be made at the instigation of the priest, the customs will be endeared and enrooted by all the influence of competitory fanaticism. The sway of the East India company has this of praise-worthy ; that it has equally respected the hereditary notions of Moslems, Seiks, Idolaters, and Christians, and has tolerated reciprocal conversion, without conferring recompences on apostacy, or privileges on foreign faith.

The would-be christianizers of Hindostan ought to draw up for that people and that climate a peculiar plan of religion, if they wish to be successful. In Ireland one form of christianity is prevalent ; in Scotland another ; in Great Britain a third ; why not provide for every main division of the empire a distinct and adapted worship ? Sir William Jones advises a new selection from our sacred books : why not also a new liturgy and a new ritual ? Surely the progress which has been made in scripture-criticism since the time of Luther, would enable our more learned cotemporaries to compile a system less dangerous to the reputation of European taste, reason, and civilization. The orientals admire the European man ;

they are acquainted with our merchants, our soldiers, and our lawyers ; if they should become acquainted with our religionists, how soon the useful spell must be dissolved ! Happily the spirit of the gentleman often corrects the spirit of the priest, and the opinions of the age forestall the opinions of the church. If an eastern hierarchy should be established, one may indulge the hope that some men will obtain preferment in it, who have more the temper of philosophers than of missionaries ; who are not less solicitous about the interests of literature than about the interests of protestantism, who prefer sincerity to conformity, and consider toleration as an essential part of equity. A bishop of Bengal may one day be found to merit the rare and pure praise lately inscribed on the monument of the bishop of Down.

One would have wished to see a dissertation, which wins a prize in a British university, remarkable for a display of the appropriate learning. Mr. Maurice is quoted and epitomized occasionally, and Sir William Jones has been consulted ; but the mass of information which Sonnerat, which Anquetil, which Fra Pauline especially, have imported into Europe concerning the religions of the east, and the braminiical system, appears to slumber unnoticed in the shelves of the college library.

ART. XX.—*Asiatic Annual Register, or a View of the History of Hindostan, and of the Politics, Commerce, and Literature of Asia, for the Years 1802 and 1803.* 8vo.

THE Asiatic Annual Register began with the present century, and has already been noticed in our first volume, p. 332. It continues to be conducted on the same plan, with increased resources and speedier assiduity.

An account of the Mahratta war, a chronicle of minute occurrences, a list of promotions, births, marriages, and deaths ; state-papers, debates in parliament and at the India-house, characters, poetry, reviews of books, and miscellaneous tracts, form the varied bill of fare.

The literary world will take an interest in the statutes of the new college of Fort William in Bengal.

It would have been well so to organize the college, that natives of the country could be received there both as pupils and professors. The christian test imposed on professors ought not to have been introduced. Can the Sanscrit, the Chinese, and similar languages, be taught by Eu-

ropeans as well as by the natives of the provinces where these languages still subsist ? This test tends to prevent the obtaining of the best possible instruction.

The life of Tofuzzel Hussein Khan will be read with high gratification throughout Europe. The example of a native of Cashmir studying so successfully our languages and our sciences ; translating into Arabic our books of mathematics, and committing to an oriental press the far-fetched select importations of his high and comprehensive acquirements ; is a harbinger of the entire civilization of the world.

What a misfortune to the progress of culture, that so many difficulties should be thrown in the way of migration to Hindostan, by the East India company ! Had an open trade subsisted during the last generation, instead of the monopoly, our arts, our habits, our literature, our sciences, would have struck root long ago

in the peninsula; our merchants would have domesticated there an European civilization; and provinces, which are now the quarry of plunder, would have been paying to commerce a voluntary and larger tribute.

ART. XXI.—*A concise Account of the Commerce and Navigation of the Black Sea: from recent and authentic Information.* 8vo. pp. 53.

ABOUT three years ago Mr. Eton was sent by government to the southern provinces of Russia, as well to purchase on trial certain naval stores, corn and salted provisions, which, it was thought, might habitually be wanted for Malta, as to make a general report concerning the facilities for British commerce offered by the several ports of the Black Sea. This pamphlet contains a summary of the information collected by him, and will form the basis of a more extensive statistical work concerning the countries visited. It contains, in a cheap, unaffected, and condensed form, matter of immediate importance to the statesman, and of lasting importance to the merchant. Literary industry may manufacture from these materials a thick book of travels, and republish what is already known of the Black Sea shore: here we obtain apart the recent additions to our circulating knowledge.

The Black Sea has deservedly been named 'the guestless,' the inhospitable, for such is the meaning of the word Euxine. In antient as in modern times, a mischievous resistance was opposed by the borderers to the navigation of this inland sea. There are natural impediments: during the summer, north-east winds are almost perpetual, and ships lie sometimes wind-bound for three months. Sharp vessels that can work well to windward are fittest for this trade. There are artificial impediments: all the ports are shut to vessels liable to quarantine, except Kaffa and Odessa, where alone lazarettos have been established. No accurate charts exist to guide navigators in the Black Sea. A vast mass of produce descends the Dnieper, which might conveniently be shipped at Oczakow: it is compelled to take the more expensive road through Odessa, by the absurd preference of prince Potemkin, who chose there to construct moles, kays, magazines, bazars, and other apparent appurtenances of commerce, in the hope of attracting a trade which nature has allotted elsewhere. Odessa has neither wood nor water: the port is bad in blowing weather: the sands washed down the Dnieper are constantly filling up the haven. The expence of carrying corn from Cherson to the Liman, is from

ten to fifteen kopeks the chetwert (about half-a-crown per bushel), but to Odessa the freight is from eighty to one hundred kopecks; on which account corn may be had cheaper in the Liman. The proper step for restoring to commerce its natural course, would be to establish another quarantine at Oczakow, for vessels destined to load in the Liman: this should be cited from the Russian government.

An English house of great respectability at Odessa, is that of Mr. Henry Seaton, a native of Exeter, who resided in Naples before its commerce was interrupted by the French. Kaffa is most likely to engross the corn-trade of Odessa: the best of its wheats is called *arnaut*; it is the kind, of which the Neapolitans make their macaroni and vermicelli. There is a sort of rye near Elinabetgrad, of which the grains measure almost half an inch in length. At Cherson the empress Catharine founded an admiralty: the disadvantage of this site is, that there is only five or six feet water, and that ships of war built there must be put into *canals*, as in Holland, to cross the bar. A general of infantry fixed his spot, as a general of cavalry fixed on Odessa.

There was a considerable French navigation to the Liman before the revolution. Toulon was thence supplied with naval stores; and the merchants of Marseille carried out the silks of Lyons and the cloths of Louviers. The return of French commerce is looked for with anxiety by all people, and particularly by the great proprietors. Its effects have founded among the nobility, or landed interest, of southern Russia, a Gallican party. It is important, as a mean of securing the alliance of Russia, that a British commerce, equivalent to that of France, should be founded in the Euxine. This may best be done by purchasing annually for the admiralty, at a regular loss, through private merchants, a certain quantity of naval stores. The merchants will soon acquire the routine of demand and supply, and a trade will thus establish itself able to stand alone. The importance of concentrating the population and metropolitan influence of Russia, rather in the south, where the soil and climate are fine,

than in the north, where a perpetual war must be waged with nature, is felt by the enlightened mind of Alexander. It is for Britain to prove that her versatile industry can as easily collect the productions of Russia through the Mediterranean as through the Baltic.

Oczakow is the natural deposit of what descends the Bog and the Dnieper. Kaffa is the natural deposit of what descends the Don. For these places lazarettoes must be obtained, and consuls appointed.

A curious fact occurs at p. 33. "The Chinese yarn-spinners make better cordage than the English. They are very clever and expeditious, and their method is preferable, as they feed the yarn from the end, at the middle of the fibres of hemp. His merits attract attention, the difference is very great."

A much wiser establishment than those of Odessa and Cherson is that of Kaffa, or, as we write, Caffa.

Vessels arriving at Caffa, any month in the year, may begin to load immediately, without quarantine, and the magazines being close to the water-side, at little expence. The magazines that bring corn from Arabat unload into boats.

The Quarantine-Lazaretto, and the whole of that establishment, as well as the custom-house, are upon the shore; and the natural fertility of the ground and port afford every convenience that can be desired for the expedition and economy of trade.

Ships of war even have a secure anchorage in the bay, though it is somewhat open, the ground being excellent. A pier is to be run out into 40 feet water, and a second and third pier for the quarantine-harbour, so that ships will not be subject to be mixed. There will be ports for ships actually having the plague on board, those under precautionary quarantine, and those that have performed it, and are not subject to it.

The city, which had been entirely ruined, is rebuilding, and trade already begins to flourish.

All these works are conducting by general Fanshaw (a general in chief, and heretofore governor general of the city and province of Kiev), than whom the emperor has not a more intelligent, active, honourable, and zealous officer in his service. The sums that will be saved by his ability and economy, are incredible. He was formerly an officer in our guards.

This is the place found most advantageous for salting of meat for exportation. The Crimea oxen are a small race, but those of the Cubans, not 100 miles from Caffa, are a fine large breed, and become very fat early enough to kill in the cool weather of the spring as well as autumn, except in some very late seasons. On the Don and Volga, are also vast herds of

cattle, which are driven to distant markets. Beginning at Bachmut, Poltava, Elizabeth, and into Poland and Germany, they feed as they go on the rich plains. From the Don to Caffa they can be brought easily. The whole road is fine pasture, and the neck of land between Arabat and Yanitsi produces rich grass. In the Caban they have salt marshes. In some parts they kill the cattle for the hides, and to boil out the fat. The only lake in the Crimea which produces salt of the best quality for preserving meat, is near to Perecop; but lately the salt of the Kertch has been found of an equal, or even superior quality; that is, it is more free of magnesia, with which other kinds of salt abound in too large a proportion. These different kinds of salt have been analyzed by Pallas and by admiral Moller at Cherson. Cattle may be bought lean, and the price of feeding them in the plains is one rouble a head. It is calculated that beef may be salted (a proper establishment being made) for five farthings to three halfpence a pound. Lean hogs are to be driven to Caffa, and there fattened on barley; which is very cheap.

Fat hogs are very reasonable at Kremenchug; but if they are killed and salted in the beginning of winter, they cannot be exported before May or June from Cherson: and salt meat does not bear land-carriage in these parts. The agent who was sent from this country, salted pork for the value of 1,000*l.* at Olgopol in Poland, in the spring of 1803; but a greater quantity of rain falling than was ever remembered, which rendered the carriage long, and great heats coming on, the whole was spoiled. I mention this that others may profit by the example. Much of the evil was also owing to the bad quality of the Polish salt.

Casks must be bespoke of the proper size and strength, and made during the winter months at Kremenchug, to have them cheap. With wooden hoops they cost about 2*s.* 6*d.* to 3*s.* each. Iron hoops are best had from the manufactory belonging to Mr. Raikes, of St. Petersburg: the carriage in winter from the forges to the Crim, is very low. An iron rolled hoop, nine feet long, costs him about 7*d.* sterling. Hence it is evident that, to enjoy every advantage, it is necessary to give orders for salted beef nearly a year beforehand. The casks and hoops must be procured in winter, the oxen purchased in spring, fed and killed in autumn. Or they may be purchased fat, generally in spring, always in October; but this is not so advantageous as buying them lean and fattening them.

The articles of the produce of the Don, Volga, and the circumjacent countries, need not be enumerated, they are known to every one. Iron comes to Czaratzin, on the Volga, in one season from Siberia, and is carried by land to the Don much cheaper than it goes to St. Petersburg; and it will be still more reasonable when the canal is completed, which will join these two rivers. It will then not cost above half the price it costs at St. Pe-

tersburgh. The oak on the Don, &c. is not so good as that on the Dneiper; but the deal or fir, for planks, is even better. Cannon, and every thing appertaining to a ship, may be brought to Caffa. Mr. Gascoign has established an iron foundry at Logan, on the Don. The Russian sheet-copper for vessels is now brought to great perfection. Hitherto the ships of war in the Black Sea were not coppered, and were much injured by worms."

Some of those gentlemen who obtain travelling fellowships at Cambridge should undertake a circuit of the Black Sea. Marble ruins, on which the chisel of Greece has left its everlasting stamp, would frequently cross their footsteps. The classical recollections, in which they delight, would crowd on the soul at every promontory. We do not condemn them to remain in Sinope, but we wish them to go thither. The popularity of their country would efficaciously be served among the Russians, by the celebration of contiguous sites, which are again becoming the haunts of civilized men. Many a patriotic suggestion will occur to the classical observer; and will travel, in association with his topics, to the polished and leading minds both of Russian and of British society. An interesting sweep of Turkish coast is thus noticed by Mr. Eton.

"The ports are, on sailing from Constantinople eastward, first Achilio, at the distance of about thirty miles; it is a place for small craft only. Thirty miles farther is Kefkani, a port for four or five ships of four or five hundred tons burthen, and two or three frigates. The next is Bender Heraclei (or Heraclea), sixty miles distant, where the largest fleet of ships of the line may anchor in per-

fect safety in all winds, though it is properly only a deep bay. From this, sixty miles lies Anastro, where there are many noble ruins and Greek and Roman inscriptions, and beautiful oak timber growing down to the water-side. It was an island, now joined to the main land by a causeway, composed, in great part, of shafts of marble columns. The sound port is dangerous, and receives only very small craft. The other port will hold frigates, but the entrance, round the point of an ancient sunken mole of marble, is rather dangerous. Around the port there are seen the remains of an ancient marble quay, with square projections into the sea. Farther is Kitros, and round the cape is Sinope, as well known that I need not describe it. Thus the Turks build most of their ships of oak, and the timber of all this coast is almost of eternal duration. It grows on dry rocky soil."

"From Sinope the coast is not exactly known, farther than that it is esteemed very safe to Trabizond and to the Phasis. From thence to the Cuban it is very little known."

Here one regrets to find only the statistical gazer; he might however with propriety have invoked the tutelary gods of the ancient traveller, Mercury, Castor and Pollux; to the service of commerce, and to the service of navigation his attention has been steadily directed.

This pamphlet should be transmitted to our ambassador at Petersburg, with orders to get it translated into Russian. The mercantile interest of Russia ought to be made aware of the unchangeable natural reasons and causes for preferring Oczakow to Odessa; in order that their petitions and representations may, if requisite, be called in, to obtain from the emperor Alexander a quarantine-establishment at Oczakow.

ART. XXII.—*The History of the Manners, Landed Property, Government, Laws, Poetry, Literature, Religion, and Language, of the Anglo-Saxons.* By SH. TURNER, F. A. S. 8vo.

HAVING detailed the civil and military history of the Anglo-Saxons in the volumes which have been already noticed, Mr. Turner in this completes his undertaking, and presents us with as correct a picture of their private life as the imperfect documents which remain could enable him to compose.

Of the Saxons in their pagan state he has gathered all that could be relied upon with certainty; and though the history is imperfect, he is amply entitled to our thanks. Their government, their laws, and their religious system, are equally obscure; nor does it seem quite certain that they had either the knowledge or the use of alphabetic characters. From the uniformity, however, of the principles of le-

gislation in continental Saxony, and in England at a subsequent period, Mr. Turner infers that pecuniary compensation was even at that time the general mode both of redressing personal injuries and punishing criminal offences: a feature, he observes, which certainly announces that the spirit of legislation even at that early period began to be understood; though their severity in one instance, against adultery, was both personal and sanguinary.

"If a woman became unchaste she was compelled to hang herself, her body was burnt, and over her ashes the adulterer was executed. Or else a company of females whipped her from district to district, and, dividing her garments near the middle, they pierced her

ready with their knives. They drove her, bleeding, from their habitations; and, moreover she went, new collections of women renewed the cruel punishment till she expired. This dreadful custom shews that the savage character of the nation was not confined to the males. Female chastity is held a virtue as indispensable as it is attractive; but its proper guardians are the general example and tuition, the constitutional delicacy of the female mind, its native sense of honour, and the uncorrupted voice of feeling of society. If it can be only maintained by the horrors of a Saxon punishment, the nation is too barbarous or too contaminated, to be benefited by the penalty."

For the domestic history of the Saxons in a later period, Mr. Turner's materials are in course more copious; and he has traced their reigning manners, the general history and spirit of their legislation, their arts, their literature, their religion, and their language, not only with correctness but with the hand of a master.

"The first great change," he observes, "the Anglo-Saxons appeared in the discontinuance of their piracies. They ceased to be the ferocious spoilers of the ocean and its islands; they became land-owners, agriculturists, and industrious citizens; they seized and divided the acquisitions of British affluence, and made the commonalty of the island their slaves. Their war-leaders became territorial chiefs, and the conflicts of capricious sanguinary robbery were exchanged for possession and inheritance of property in various sorts; for trades and manufactures; for useful luxuries, peaceful industry, and domestic comfort."

In what relates to the institution of their earliest years there is one fact, the remembrance of which appears only to have been preserved by the Anglo-Saxon laws, and which we could not but contemplate with astonishment.

"The northmen were in the habit of exposing their children. The Anglo-Saxons seem not to have been unacquainted with this inhumanity; as one of the laws of Ina provides, that for the fostering of a foundling in shillings should be allowed the first year, twelve the next, thirty the third, and afterwards according to his witte, or his personal appearance and beauty."

The course of education, however, by which the Anglo-Saxons conducted their children to maturity, cannot be detailed with all the minuteness an inquisitive reader might perhaps desire. Society, it should seem, was then divided but into two orders: and laymen and ecclesiastics were the other terms for ignorance and learning. So early as the seventh century, in-

deed, there were a few found who rose above the level of the age, and endeavoured to recommend the use of schools. But the principal improvements in Saxon education were the work of Alfred, in whose view none could be either great or powerful who undervalued knowledge: and something must be also attributed to the emigration of the Irish ecclesiastics.

From the chapters on their food, their drinks, and cookery, we learn that their tables were better furnished than we usually suppose them to have been. They had oxen, sheep, and swine; and they used fowls, deer, goats, and hares. Among their fish, eels are by far the most profusely noticed; and to the more common of the sea-fish now in use, they added the *dolphin* and the *porpoise*. Orchards too were cultivated; and we find figs, grapes, nuts, almonds, pears, and apples, mentioned. Their principal drinks were wine, mead, ale, piment, morat, and cyder. And cookery, it appears, was not merely a matter of taste, but of indispensable decorum.

In regard to dress, the terms which have reached us are at this distant period but difficultly comprehended; but it is more than probable that the reader will, from the following extract, form a good notion of an Anglo-Saxon lady:

"The wife described by Aldhelm has necklaces and bracelets, and also rings, with gems on her fingers. Her hair was dressed artificially; he mentions the twisted hairs delicately curled with the iron of those adorning her.

"In this part of her dress she was a contrast to the religious virgin, whose hair was entirely neglected. Their hair was highly valuable and reputable among the Saxon ladies. Judith is perpetually mentioned with epithets allusive to her hair. Her twisted locks are more than once noticed:

"The maid of the Creator
With twisted locks,
Took then a sharp sword.

"She with the twisted locks.
Then struck her hateful enemy,
Meditating ill,
With the ruddy sword.

"The most illustrious virgin
Conducted and led them,
Resplendent with her twisted locks,
To the bright city of Bethulia.

"The laws mention a free woman, labouring, wearing her locks as a distinguishing circumstance. Judith is also described with her ornaments:

"The prudent one adorned with gold
Ordered her maidens —"

Then commanded he
The blessed virgin
With speed to fetch
To his bed rest,
With bracelets laden,
With rings adorned.

"Aldhelm also describes the wife as loving to paint her cheeks with the red colour of stibium. The art of painting the face is not the creature of refinement; the most barbarous nations seem to be the most liberal in their use of this fancied ornament.

"The will of Wynflæd makes us acquainted with several articles of the dress and ornaments of an Anglo-Saxon lady. She gives to Æthelflæda, one of her daughters, her engraved beah, or bracelet, and her covering mantel (mentel). To Eadgyfa, another of her daughters, she leaves her best dun tunic, and her better mantel, and her covering garment. She also mentions her pale tunics, her tofn cyrtel, and other linen, web, or garment. She likewise notices her white cyrtel, and the cuffs and ribband (cuffian and bindan).

"Among the ornaments mentioned in the Anglo-Saxon documents we read of a golden fy, beautifully adorned with gems; of golden vermiculated necklaces; of a bulla that had belonged to the grandmother of the lady spoken of; of golden head-bands, and of a neck cross.

"The ladies had also gowns; for a bishop of Winchester sends as a present 'a short gown (gunna) sown in our manner.' Thus we find the mantle, the kirtle, and the gown, mentioned by these names among the Saxons, and even the ornament of cuffs.

"In the drawings on the manuscripts of these times, the women appear with a long loose robe, reaching down to the ground, and large loose sleeves. Upon their head is a hood or veil, which falling down before, was wrapped round the neck and breast. All the ladies in the drawing have their necks, from the chin, closely wrapped in this manner, and in none of them is a fine waist attempted to be displayed, nor have their heads any other covering than their hood."

Of their houses, furniture, luxuries, conviviality, and amusements, it would be impossible to convey an adequate idea here; we shall therefore content ourselves with observing that, from the scattered notices which could be obtained from a laborious perusal of the Saxon writings, Mr. Turner has formed a little memoir, which merits more than ordinary care in the perusal.

The chapter on their trade is replete with valuable and instructive information: although little of extraordinary interest occurs in the history of their commercial navigation: and this we rather wonder at, since it was as early as the eighth century that the commerce of Britain, which from

the time of the Romans had been almost totally extinguished, appears to have revived.

In the calculation of their money Mr. Turner reconciles some apparent contradictions; and brings an authority from the laws of Alfred, which seems to indicate that there were two sorts of pennies in use, the greater and the less. The gold coins in use among them he considers have been foreign; since the pretensions of none which have been hitherto discovered have been acknowledged by our antiquaries. But there is one passage in which the numismatic readers will probably be divided in opinion.

"That the Anglo-Saxons did not use coin before the Roman ecclesiastics introduced the custom, is an idea somewhatarranted by the expression they applied to it. This was mynet, a coin, and from this, mynetian, to coin, and mynetere, a person who coins. These words are obviously the Latin moneta and monetarius; and it usually happens when one nation borrows such a term from another, they are indebted to the same source for the knowledge of the thing which it signifies."

On the chivalry of the Anglo-Saxons we have a curious chapter. Not the chivalry, indeed, which was accompanied that refined and enthusiastic spirit of chivalry which marked a brighter period, but chivalry in its first form, as a military investiture.

Of the chapters on their landed property we shall say but little. One of the curious is perhaps that on the burdens which their lands were liable. On military service the principal of the exactions are new: but it is from the quæstor's survey that the most precise information has been collected.

"The other two great services to which land was generally liable were, the construction or reparation of bridges, and fortification of walls. These are enjoined to be done on most every grant. In Domesday-book is a record of Chester, that the prepositus caused one man for every hide to come and build the wall and bridge of the city, or if a man should fail to come, his lord was to fine him forty shillings.

"Besides these three great services, later writers have called the trinoda servitium, there were many other burdens to which the landed interest was more or less subjected in the hands of the sub-proprietors.

"A careful provision is made in the laws against royal tributes and impositions on those of the great and powerful. It is mentioned that the king should not require his pasture, nor the entertainment of those men called feasting-men, nor of

to carry hawks, falcons, horses, or dogs. another it is agreed that the wood should be cut for the buildings of either king or prince. It is elsewhere expressed that the land should be free from the pasture and retention of those men called in Saxon *walhild*, and their feasting, and of all Englishmen or foreigners, noble and ignoble. This idea, of being compelled to entertain guests, is mentioned in several grants. In the pasture of the king's horses and swine, and of his swine, which was called *maleswe*, is noticed."

Among the particulars, however, of the places in Middlesex and London in the Saxon times, we perceive one or two of modern names in which Mr. Turner certainly mistaken. Ticheham, in the *Wonsday Survey*, is not *Twickenham*, but *Ickenham*: had it been the former it would have been specified not in *Elthorne*, but in *Hounslow hundred*. *Hergotestane*, is not *Heston* but *Haggerstone*, a detached hamlet in the neighbourhood of *Windsor*.

The fourth, sixth, and seventh chapters of the third book, on their conveyances, and law-suits about land, and denominations of land, are almost needless: at least their omission would have been no loss to the work. But the election and coronation of the Anglo-Saxon kings carries a noble share of interest. In those times the crown was not hereditary, but elective. It remained so till the Norman conquest terminated the power of the Saxon Witenagemot, and made a change highly propitious to our national prosperity.

"The Coronation Oath.

"In the name of Christ, I promise three things to the christian people, my subjects:

"First, That the church of God and all the christian people shall always preserve true peace under our auspices.

"Second, That I will interdict rapacity and all iniquities to every condition.

"Third, That I will command equity and justice in all judgments, that to me and to you gracious and merciful God may extend his mercy."

All shall say amen. These prayers shall follow, which the bishops are separately to recite.

"We invoke thee, O Lord, Holy Father, mighty and Eternal God, that this thy servant (whom by the wisdom of thy divine dispensations from the beginning of his formation this present day, thou hast permitted to increase, rejoicing in the flower of youth) endued with the gift of thy piety, and full of the grace of truth, thou mayest cause to be always advancing, day by day, to better things before God and men. That, rejoicing in the purity of supernal grace, he may receive the

throne of supreme power, and defended on all sides from his enemies by the wall of thy mercy, he may deserve to govern happily the people committed to him with the peace of propitiation and the strength of victory."

"Second Prayer.

"O God, who directest thy people in strength, and governest them with love, give this thy servant such a spirit of wisdom with the rule of discipline, that, devoted to thee with his whole heart, he may remain in his government always fit, and that by thy favour the security of this church may be preserved in his time, and christian devotion may remain in tranquillity; so that, persevering in good works, he may attain, under thy guidance, to thine everlasting kingdom."

'After a third prayer, the consecration of the king by the bishop takes place, who holds the crown over him, saying,

"Almighty Creator, Everlasting Lord, Governor of heaven and earth, the maker and disposer of angels and men, King of kings and Lord of lords, who made thy faithful servant Abraham to triumph over his enemies, and gavest manifold victories to Moses and Joshua, the prelates of thy people, and didst raise David, thy lowly child, to the summit of the kingdom, and didst free him from the mouth of the lion and the paws of the beast, and from Goliath, and from the malignant sword of Saul and his enemies; who didst endow Solomon with the ineffable gift of wisdom and peace: look down propitiously on our humble prayers, and multiply the gifts of thy blessing on this thy servant, whom, with humble devotion, we have chosen to be king of the Angles and the Saxons. Surround him every where with the right hand of thy power, that, strengthened with the faithfulness of Abraham, the meekness of Moses, the courage of Joshua, the humility of David, and the wisdom of Solomon, he may be well-pleasing to thee in all things, and may always advance in the way of justice with inoffensive progress.

"May he so nourish, teach, defend, and instruct the church of all the kingdom of the Anglo-Saxons, with the people annexed to it, and so potently and royally rule it against all visible and invisible enemies, that the royal throne of the Angles and Saxons may not desert his sceptre, but that he may keep their minds in the harmony of the pristine faith and peace! May he, supported by the due subjection of the people, and glorified by worthy love, through a long life, descend to govern and establish it with the united mercy of thy glory! Defended with the helmet and invincible shield of thy protection, and surrounded with celestial arms, may he obtain the triumph of victory over all his enemies, and bring the terror of his power on all the unfaithful, and shed peace on those joyfully fighting for thee! Adorn him with the virtues with which thou hast decorated thy faithful servants; place him high in his dominion, and anoint him with the oil of the grace of thy Holy Spirit!"

"Here he shall be anointed with oil; and this anthem shall be sung:

"And Zadoc the priest, and Nathan the prophet, anointed Solomon king in Sion, and, approaching him, they said, May the king live for ever."

"After two appropriate prayers, the sword was given to him, with this invocation:

"God! who governest all things, both in heaven and in earth, by thy providence, be propitious to our most christian king, that all the strength of his enemies may be broken by the virtue of the spiritual sword, and that thou combating for him, they may be utterly destroyed!"

"The king shall here be crowned, and shall be thus addressed:

"May God crown thee with the crown of glory, and with the honour of justice, and the labour of fortitude; that by the virtue of our benediction, and by a right faith, and the various fruit of good works, thou mayest attain to the crown of the everlasting kingdom, through his bounty whose kingdom endures for ever."

"After the crown shall be put upon his head, this prayer shall be said:

"God of eternity! commander of the virtues, the conqueror of all enemies, bless this thy servant, now humbly bending his head before thee, and preserve him long in health, prosperity, and happiness. Whenever he shall invoke thine aid, be speedily present to him, and protect and defend him. Bestow on him the riches of thy grace; fulfil his desires with every good thing, and crown him with thy mercy."

"The sceptre shall be here given to him, with this address:

"Take the illustrious sceptre of the royal power, the rod of thy dominion; the rod of justice, by which mayest thou govern thyself well, and the holy church and christian people, committed by the Lord to thee! Mayest thou, with royal virtue, defend from the wicked; correct the bad, and pacify the upright; and that they may hold the right way, direct them with thine aid, so that from the temporal kingdom thou mayest attain to that which is eternal, by his aid whose endless dominion will remain through every age."

"After the sceptre has been given, this prayer follows:

"Lord of all! fountain of good! God of all! Governor of governors! bestow on thy servant the dignity to govern well, and strengthen him that he become the honour granted him by thee. Make him illustrious above every other king in Britain! Enrich him with thine affluent benediction, and establish him firmly in the throne of his kingdom! Visit him in his offspring, and grant him length of life! In his day, may justice be pre-eminent, so that, with all joy and felicity, he may be glorified in thine everlasting kingdom."

"The rod shall be here given to him with this address:

"Take the rod of justice and equity, by

which thou mayest understand how to soothe the pious and terrify the bad; teach the way to the erring; stretch out thine hand to the faltering; abase the proud; exalt the humble; that Christ our Lord may open to thee the door, who says of himself, 'I am the door; if any enter through me he shall be saved.' And he who is the key of David, and the sceptre of the house of Israel, who opens and no one can shut; who shuts and no one can open may he be thy helper! He who bringeth the bounden from the prison-house, and the one sitting in darkness and the shadow of death, that in all things thou mayest deserve to follow him of whom David sang: 'Thy seat, God, endureth for ever; the sceptre of thy kingdom is a right sceptre.' Imitate him who says, 'Thou hast loved righteousness, and hated iniquity; therefore God, even the God, has anointed thee with the oil of gladness above thy fellows.'

The benedictions follow.

"May the Almighty Lord extend the right hand of his blessing, and pour upon thee the gift of his protection, and surround thee with a wall of happiness, and with the guardianship of his care; the merits of the holy Mary of St. Peter, the prince of the apostles; and of St. Gregory, the apostle of the English, and of all the saints interceded for thee!"

"May the Lord forgive thee all the evil thou hast done, and bestow on thee the grace and mercy which thou humbly askest of him, that he may free thee from all adversity, and from all the assaults of visible or invisible enemies."

"May he place his good angels to watch over thee, that they always and every when may precede, accompany, and follow thee; and by his power may he preserve thee from sin, from the sword, and every accident and danger."

"May he convert these enemies to the benignity of peace and love, and make thee gracious and amiable in every good thing; and may he cover those that persecute and hate thee with salutary confusion; and may everlasting sanctification flourish upon thee."

"May he always make thee victorious and triumphant over thine enemies, visible or invisible, and pour upon thy heart both the fear and the continual love of his holy name, and make thee persevere in the right faith and in good works; granting thee peace in thy days, and with the palm of victory may he bring thee to an endless reign."

"And may he make them happy in this world, and the partakers of his everlasting felicity, who will to make thee king over his people."

"Bless, Lord, this elected prince, thou who rulest for ever the kingdoms of all kings."

"And so glorify him with thy blessing, that he may hold the sceptre of Solomon with the sublimity of a David, &c."

"Grant him, by thy inspiration, so to govern thy people, as thou didst permit Solomon to obtain a peaceful kingdom."

"Designation of the State of the Kingdom.

"Stand and retain now the state which you have hitherto held by paternal succession, with hereditary right, delegated to thee by the authority of Almighty God, and our present delivery, that is, of all the bishops and other servants of God; and in so much as thou hast beheld the clergy nearer the sacred ears, so much more remember to pay them the honour due, in suitable places. So may the Mediator of God and men confirm thee mediator of the clergy and the common people, on the throne of this kingdom, and make thee reign with him in his eternal kingdom."

"This Prayer follows:

"May the Almighty Lord give thee, from the dew of heaven, and the fatness of the earth, abundance of corn, wine, and oil! May the people serve thee, and the tribes adore thee! Be the lord of thy brothers, and let the sons of thy mother bow before thee: he who blesses thee shall be filled with blessings, and God will be thy helper: may the Almighty bless thee with the blessings of the heaven above, and in the mountains and the vallies; with the blessing of the deep below; with the blessing of the suckling and the womb; with the blessings of grapes and apples; and may the blessing of the ancient fathers, Abraham, Isaac, and Jacob, be heaped upon thee!

"Bless, Lord, the courage of this prince, and prosper the works of his hands; and by thy blessing may his land be filled with apples, with the fruits, and the dew of heaven, and of the deep below; with the fruit of the sun and moon; from the top of the ancient mountains, from the apples of the eternal hills, and from the fruits of the earth and its fulness!

"May the blessing of Him who appeared in the bush come upon his head, and may the full blessing of the Lord be upon his sons, and may he steep his feet in oil.

"With his horn, as the horn of the rhinoceros, may he blow the nations to the extremities of the earth; and may He who has ascended to the skies be his auxiliary for ever."

"Here the coronation ends."

The commentary on the laws of the Anglo-Saxons, though not full, is satisfactory: the progress of their legislation is traced in some of its more prominent features, and in the principal offences: and their legislative system well digested.

But it is time we should now enter on the pleasing, though perhaps less diversified, portion of Anglo-Saxon history, which we formerly recommended to Mr. Turner's notice: the rise and progress of their literature. On this head we cannot but express surprise, that it has been hitherto so much neglected: particularly as we have now a foundation in the university of Oxford for the preservation and encouragement of the Anglo-Saxon tongue.

Ann. Rev. Vol. IV.

Mr. Turner's first observations are directed to the *Latin* poetry of the Anglo-Saxons, as it was cultivated by Aldhelm, Bede, Boniface, Alcuin, and others, in the eighth, ninth, and tenth centuries. And the specimens he has cited, though they may have few charms for modern scholars, at any rate acquaint us with the attainments and powers of composition of those men who gave the first effectual encouragement to learning in the island.

On the *vernacular* poetry of the Anglo-Saxons, Mr. Turner's efforts at investigation have been more laborious. And though the mechanism and scheme of versification of the earliest specimens may be inexplicable, yet will it be found that, toward the close of the Anglo-Saxon æra, poetry began to lay aside its homely dress and coarser features, and assumed the style, the measures, and the subjects which in a future age were so happily displayed as to deserve the notice of the latest posterity. Among its leading features, Mr. Turner reckons the omission of the *minuter* particles of speech, the contraction and inversion of phrases, and the periphrasis. The most ancient specimen is a fragment of sacred poetry, by the first Cædmon, preserved in king Alfred's version of Bede's Ecclesiastical History.

Aldhelm also was a votary of the muses in his *native* tongue; and king Alfred is said to have inserted it as a remark in his manual, that no one had ever appeared before Aldhelm so competent in English poetry. None had ever composed so much, and none could either sing or recite it so appositely. But, which is very singular, not one specimen of his vernacular poetry has survived.

King Alfred's translations of the poetry in Boethius deserve a notice particularly favourable; and Mr. Turner has displayed them to advantage. And there are some fragments of poetry of peculiar interest, which may be found interspersed among the naked facts related in the Saxon chronicle.

But the poet who deserves most notice, perhaps, was the second, or pseudo, Cædmon, whose paraphrase of Genesis was edited by the celebrated Junius.

"In its first topic, 'the fall of the angels,' it exhibits much of a Miltonic spirit; and if it were clear that our illustrious bard had been familiar with Saxon, we should be induced to think that he owed something to the paraphrase of Cædmon. No one at least can read Cædmon without feeling the idea intruding upon his mind."

T

Cædmon thus describes the creation :

" There was not yet then here,
Except gloom like a cavern,
Any thing made.
But the wide ground
Stood deep and dim
For a new lordship,
Shapeless and unsuitable.
On this with his eyes he glanced,
The king stern in mind,
And the joyless place beheld.
He saw the dark clouds
Perpetually press
Black under the sky,
Void and waste ;
Till that this world's creation,
Thro' the word was done,
Of the King of Glory.

" Here first made
The eternal Lord,
The patron of all creatures,
Heaven and earth.
He reared the sky,
And this roomy land established
With strong powers,
Almighty Ruler !

" The earth was then yet
With grass not green,
With the ocean covered,
Perpetually black ;
Far and wide,
The desert ways.

" Then was the glory-bright
Spirit of the Warder of heaven,
Borne over the watery abyss
With great abundance.
The Creator of angels commanded,
The Lord of life,
Light to come forth,
Over the roomy ground.

" Quickly was fulfilled
The high King's command ;
The sacred light came
Over the waste
As the Artist ordered.
Then separated
The Governor of victory
Over the water-flood,
Light from darkness,
Shade from shine ;
He made them both be named,
Lord of life !
Light was first
Thro' the Lord's word,
Called day,
Creation of bright splendor.

" Pleased well the Lord
At the beginning,
The birth of time,
The first day.
He saw the dark shade
Black spread itself
Over the wide ground,
When time declined

Over the oblation-smoke of the earth.
The Creator after separated
From the pure shine,
Our Maker,
The first evening.
To him ran at last
A throng of dark clouds.
To these the King himself
Gave the name of night :
Our Saviour
These separated.
Afterwards as an inheritance
The will of the Lord
Made and did it
Eternal over the earth.

" Then came another day,
Light after darkness,
The Warder of life then commanded
The greater waters
In the middle to be
A high-like heaven timber.
He divided the watery abyss,
Our Governor,
And made them
A fastness of a firmament.
This the great one raised
Up from the earth,
Through his own word,
Almighty Lord !

" The world was divided
Under the high firmament,
With holy might ;
Waters from waters :
From those that yet remain
Under the fastness,
The roof of nations.
Then came over the earth,
Hasty to advance,
The great third morning.

" There were not then yet made
The wide land,
Nor the useful ways ;
But the earth stood fast,
Covered with flood.
The Lord of angels commanded
Thro' his word,
The waters to be together
That now under the firmament
Their course hold,
An appointed place.
Then stood willingly
The water under heaven,
As the Holy One commanded.

" Far from each other,
There was separated
The water from the land.
The Warder of life then beheld
Dry regions ;
The Keeper of the virtues
Wide displayed them :
Then the King of Glory
Named them earth."

Other striking specimens of Anglo-Saxon poetry are quoted from the fragment of the history of Judith, published

a the 'Heptateuch:' but we have not room to give them here. The principal information that we gain from them is, that its leading features were the metaphor and the periphrasis.

The most interesting remains, however, of Anglo-Saxon poetry which time has suffered to reach us, are contained in a manuscript in the Museum, from which Mr. Turner's extracts have been both copious and judicious. Mr. Turner thinks that this curious manuscript preserves the best poem of an epic form in the vernacular language of Europe which now exists. It undoubtedly deserves to be submitted to the public.

The general literature of the Anglo-Saxons must be dated from their conversion to christianity: they derived it chiefly from their religious intercourse with Rome: and their literary progress first began by the introduction into England of Latin and Greek languages, and by the collection of their books. The sixth and seventh centuries were the happy times of wisdom and knowledge which England had known before his time, alluded to by Alfred. Yet though literature in the seventh and eighth centuries was striking its root into every part of England, it was in the monasteries almost exclusively that it met with any fit soil, or displayed any vegetation. The ignorance of the secular part

of society was not only gross, but general. Mr. Turner's observations on the state of learning at this period are truly valuable, and he closes them with literary memoirs of those from whom it received its best encouragement.

Of the arts and sciences of the Anglo-Saxons, Mr. Turner's information has been gathered from the best sources; but there are one or two points in which we cannot fairly agree with him. That the first Saxon churches of our island were all built of wood may be very fairly doubted. That of Greenstead in Essex (p. 452), was originally built but as a temporary chapel for the reception of St. Edmund's body in its way to town. And Ilstey (p. 460), should be *Istley* church, which not only was not a Saxon building, but is known to have been erected by a bishop of Lincoln in the twelfth century.

On the more abstruse sciences of the Anglo-Saxons, the propagation of christianity among them, and the progress of their language, we have not room for extracts. In the latter enquiry much has been built on Mr. Tooke's foundation. To say more would be superfluous. It is true we have pointed out a few faults, but we have rarely seen a book replete with knowledge more curious or more instructive.

ART. XXIII.—*Defence of the Principle of Monopoly of Corn-factors or Middle Men, and Arguments to prove that War does not produce a Scarcity of the Necessaries of Life.* 8vo, pp. 30.

THIS author uses the word *monopoly*, not in its proper sense for *exclusive dealing*, but in an arbitrary sense for *large dealing*. By thus changing the meaning of the word, in defiance both of etymology and of usage, he may easily make it appear that what he calls monopoly, that is, the employment of large capitals in any given branch of business, is useful to the public; a truism which has never been called in question.

Large farms are here most absurdly classed as monopolies; whereas they increase the competition of sellers: for small farmers cannot afford to attend the corn-markets, but dispose of their produce to the miller and the inn-keeper without throwing it into the national stock at all; while large farmers bring their grain to the merchant, and accept whatever price results from the average demand.

The East India Company, on the other hand, is justly classed as a monopoly;

but it is not equally just to class it as a useful institution. The conquests in Hindostan have chiefly resulted from the interference of the state through its military patronage and its board of controul. The commerce of Hindostan would more than double instantly, in case of a dissolution of the Company: it would probably have ascended to ten times its present amount, if the Company had been abolished in 1783. Compare the rapid growth of West Indian commerce under a free trade, with the slow and lingering growth of East Indian commerce under a monopoly: although in the East Indies there existed already a vast and civilized population to deal with, and the privilege of intercourse pervaded continents and islands immeasurable and innumerable; while in the West Indies the population was to create, and the agriculture too, before any profitable intercourse could be founded.

An attempt is made to show (p. 25), that war cheapens corn; but the few instances adduced do not suffice to establish an improbable general principle.

ART. XXIV.—*Mémoire sur les Relations Commerciales des Etats-Unis avec l'Angleterre* Par le Citoyen TALLEYRAND. Lu à l'Institut National, le 15 Germinal, An 5. *Suite d'un Essai sur les Avantages à retirer de Colonies Nouvelles dans les Circonstances présentes.* Par le même Auteur. Lu à l'Institut, le 15 Messidor, An 5. 8vo. pp. 47.

THE two dissertations here reprinted in French are extracted from the Memoirs of the Parisian Institute, where they were originally read, and received with a courtly, but with a rational approbation. They originate from the French minister for foreign affairs, and have therefore a title to be considered, not merely as the speculations of an enlightened individual, but as the projects of an active and ambitious government.

The first respects the commerce of the United States with Great Britain. It reveals to France that little hope can now be entertained of superseding the British merchants in the American trade. If the monopoly enjoyed by France during the rebellion, if the regulations obtained during the fresh emotions of gratitude for their emancipation, did not suffice to divert the current of commerce from its ancient channel, no new motives can be offered strong enough to affect the result. The habit of analogous wants, and of reciprocal accommodation, the use of a common language, the kinship of the people, the similarity of their laws, which decides in an expected manner every question of property, the Englishness of Washington's disposition, which favoured an early and entire reconciliation, the sympathy of religious sentiment between the trading towns and classes of Great Britain and those of North America, would account for a preference of intercourse, were circumstances of interest in equipoise: but the British nation has, besides, the advantage of manufactures more cheap and more adapted, and of capitals more profuse and more rotatory than the French nation.

The American character is, in Talleyrand's opinion, and he had observed it closely on the spot, not fixed. He sketches with eloquence the woodman and the fisherman, as the most common specimens of native manners: the inhabitants of towns are the British. He omits to observe that there is a growing difference of opinion, and of spirit, between the northern and the southern states. The state of New York, and all the more northerly, tend to receive from Boston the colouring of their

manners and opinions: they resemble the calvinistic protestants of Europe in their probity, in their love of order and discipline, in their frugality, their puritanism, their piety. The state of Pennsylvania and all the more southerly, tend to receive from Baltimore the colouring of their manners and opinions: they resemble the deistical classes of Europe in their ambition, in their love of liberty and independence, in their profusion, their liberalism, their profaneness. The former has a Scottish, the latter an Irish basis of character: the former delight in maritime, the latter aspire to military enterprise. The profuse employment of negroes in the southern states will gradually found mulatto peasantry and a clipt jargon. It is not unlikely that geographical partition may arise, and that the northern and southern states may separate from each other under the chieftaincy of distinct presidents. In that case the southern states will less discline to French alliance.

The results drawn from the facts adduced are, 1st, "That the first years of a peace decide the commercial system of a state, and that, if these are not turned to account, the neglect becomes irreparably ruinous.

2d, "That commercial habits are broken with more difficulty than is supposed, and that interest may approximate at once and for ever those who were armed for years against each other.

3d, "That, in the calculation of durable connection between men, identity of language is to be reckoned as one of the strongest bonds.

4th, "That the liberty, and especially the equality of religious sects, is one of the most powerful instruments of social tranquillity; for where consciences are respected, other rights will be so too.

5th, "That the spirit of commerce, which renders men tolerant from indifference, also renders them selfish from avidity; and that a people, whose morality has been shaken by long agitations, ought by wise institutions to be attracted toward agriculture; for commerce keeps the passions in effervescence, but agriculture calms them.

"And finally, that after a revolution which has changed every thing, a man must know how to renounce his hatreds he would secure his happiness."

There is good sense and good writing in this dissertation; but less originality of force of thought, and less precision and splendour of expression, than might have been expected from one, who ranks high among French intellects, and who has attained a celebrity so European.

The second essay has a superior merit. It begins by predicting the separation of the West India islands from their respective mother-countries. This is not easy. About a vast protecting naval force, such as North America cannot yet furnish, the British colonies could not rebel without risking to incur a total devastation; and being under the necessity of arming the slaves, for whom the independence could be acquired.

It next recommends the establishment of new colonies, as a commercial substitute for the old, and as a mean of busying and providing for those agitators, who, having been disappointed in one revolution, are for trying others.

"In examining the motives (says Talleyrand) which instigated the establishment of ancient colonies, it may be remarked, that, even when they were indispensable, they were still voluntary: they are suggested by governments as an interesting speculation, not as a penal banishment. This idea is especially conspicuous, in states ought always to hold in reserve the means of placing usefully, out of their own precincts, that superfluity of citizens, which, from time to time, grows formidable to tranquillity."

The author next adverts to the colonization of Louisiana, undertaken in 1719, and of Cayenne, undertaken in 1763, by the French government. He attributes the failure to the not sending out orderly industrious frugal families, instead of profligate spendthrift disgraced adventurers.

Finally, he proposes the islands along the African coast, near the mouths of the Senegal and the Gambia, as the proper seats of a new colonization. This project, we believe, originated with Montlinot, and was further evolved by Golberry, in a publication consecrated to that purpose. It is said that the recommendation of Talleyrand had weight with Mr. Pitt, who was about to send out, under Capt. Beaver, a well-appointed preliminary cargo of settlers for Bulam, in order thence to overspread this very distant tract.

The French are less adapted to be the founders, than the conquerors of colonies. Their Cayenne has in forty years not attained so great a prosperity, as Britain added to Demerary in five, by taking it under her protection. It is the same in Canada: the habits of our emigrants are so much more favourable to thrift, that the English population doubles its numbers as fast again as the French; and their very language is in danger of becoming obsolete. The French resemble the Greeks of antiquity: they have the military and intellectual virtues, not the civil and commercial: they have courage and talent, not probity and industry. It is wiser for them to invade than to found; to seize than to earn. The soundest advice given them in this essay, is the indirect intimation (at p. 45), that it would be well to prepare by negotiations the cession to France of Egypt: they would there occupy the sovereign and ornamental situations of society, with little need of toil, and none of morals: they would direct to more productive forms of agriculture the labours of a swarming population, and would carry the arts and literature to revisit the nest whence they sprang. The French would be quieter neighbours to Europe and to ourselves, if they had an outlet for their wild population: Egypt is for us, for them, for all men, precisely the safest stowage.

The peroration is thus conceived:—"From what has been advanced it follows, that every thing presses us to be busied about new colonies: the example of the wisest nations who have made them means of tranquillity; the necessity for providing against the separation of our actual colonies, in order not to be left behindhand by events; the expediency of cultivating tropical productions in the neighbourhood of their natural cultivators; the propriety of forming with our colonies a more natural sort of union, which will be easier in new than in old establishments; the advantage of not being forestalled by a rival nation, for which each of our delays in this way is a conquest; the opinion of enlightened men who have directed their attention and their enquiries to this object; and, finally, the pleasure of being able to attach to such enterprizes those speculative men who want projects, and those disappointed men who want hopes.

"*Diversa exilia et desertas quærere terras
Auguriis agimur Divum.*"

ART. XXV.—*A Treatise on the Coins of the Realm; in a Letter to the King. By CHARLES EARL OF LIVERPOOL.* 4to. pp. 268.

LORD LIVERPOOL has been repeatedly heard of in the republic of letters. He published, in 1757, a discourse on the establishment of a national and constitutional force in England: it prepared the subsisting militia-system, to the multitudinous defects of which our objections were stated at page 233 of the third volume of the Annual Review. About the same period he composed a discourse on the conduct of Great Britain toward neutral nations; it introduced the insolent and novel principle, which has sometimes been called 'the rule of the war 1756,' and which occasioned those successive combinations of the maritime powers against Great Britain, that to this hour continue to perplex our statesmen, to harass our security, and to abrade our continental popularity. In 1785, he issued a collection of treaties of peace, unaccompanied with such a dissertation on the science of negotiations as the abbé Mably had prefixed to a similar collection. He now undertakes a treatise on the coins of the realm. With much parade of authority and information, with views far from illiberal, he is apt to elude specific advice and definite inference; and, after appearing to consider a subject in various bearings and comprehensive points of view, he leaves the reader willing enough to accept his result, but often unprovided with it. He is tediously diffuse, and prosingly instructive; he has too much of the micrology of an antiquary, too little of the precision of a statesman.

This work begins with an account of the state of the coins at the accession of his present majesty. It proceeds to the definition of money, or coin, and to the description of the metals of which it is made. The imperfections to which coin is subject as a standard measure, or equivalent, are next considered; and the necessity is indicated of preferring some one metal as the measure of the rest.

The authority by which coins are made current, the English standard of gold and silver, and the moneyer's pound, are properly explained. The several ways in which coin may be debased next pass in review; and some historical statements occur respecting our early coins.

The relative values of gold and silver, the inconvenience and expence arising from their fluctuation, the profits made

by interchanging them for each other, the reformations in the monetary system begun by Edward VI. and completed under Elizabeth, together with the apparent motives for these changes, constitute another series of topics.

At length come the principles of coinage, which are, page 113, according to our author: 1. That the coins, which are to be the principal measure of property, ought to be made of one metal only: 2. The author proposes to shew of what metal the coins of this kingdom, which are to be the principal measure of property, ought to be made: and, 3. Of what principles the coins of the other metals ought to be made. In illustration of the second of these propositions, the earl of Liverpool argues thus:

"In very poor countries coins have been and still are, principally made of copper; and sometimes even of less valuable materials.

"In countries advanced to a certain degree of commerce and opulence, silver is the metal of which coins are principally made.

"In very rich countries, and especially in those where great and extensive commerce is carried on, gold is the most proper metal, of which this principal measure of property, and this instrument of commerce, should be made: in such countries gold will in practice become the principal measure of property, and the instrument of commerce, with the general consent of the people, not only without the support of law, but in spite of almost any law that may be enacted to the contrary; for the principal purchases and exchanges cannot there be made, with any convenience, in coins of a less valuable metal. In this your majesty's kingdom, so great is its wealth, and so various and extensive is its commerce, that it is become inconvenient to carry on many of the principal branches of trade, or to make great payments, even in coins of gold, the most precious of metals: on this account a very extensive paper currency has been called to its aid: but this paper can never be considered as coin, for it has no value in itself; it only obtains its value with reference to the coins which it represents.

"There is still further reason for preferring at present the gold coins to those made of silver, as the principal measure of property and instrument of commerce in these your majesty's dominions. This measure ought certainly to be made of that metal, which varies least in its price or value at the market. It is difficult to conceive, that in a commercial light the price or value of any commodity can be estimated, but with reference to some other commodity, either gold or silver, or

nothing else; and the price or value of the precious metals is generally estimated with reference to each other; that is, according to the plenty or scarcity, and the demand there may be for each of them. It is certain too, that the price or value of gold bullion, in the British market, has for many years varied more than the price or value of silver bullion. In an account I have seen of the price of gold for forty-one years previous to the year 1797, it appears, that the price of gold, during that period, has varied $16\frac{2}{11}\frac{1}{7}$ per cent. It is true that, before the general recoinage of the gold coin, the prices, both of gold and silver bullion, advanced, in consequence of the then defective state of our gold coins, as has been observed already: the true position therefore in the price of silver will more accurately taken, by giving an account of this variation, subsequent to the general recoinage of our gold coin. It appears by the account last stated, that the price of silver in dollars has varied in twenty years, that is, from the end of the year 1774, to the 31st of December 1797, $11\frac{1}{4}\frac{1}{4}\frac{1}{4}$ per cent. and even in the course of one year, that is, the year 1797, no less than $9\frac{1}{2}$ per cent.

The variation in the price of silver bullion appears to have been still greater, by another account, with which I have been favoured by the late Mr. Garbett, an eminent merchant and manufacturer at Birmingham: here appears, that the silver purchased by him, as a refiner, with bank notes, varied, according to his calculation, in the course of twenty years, to 1793, more than 194 per cent. in one year only, more than 134 per cent. From information, on which I can rely, it appears, that the bank directors have in general paid for gold bullion, during twenty years previous to the year 1797, not more than 3l. 17s. 6d. per ounce. But occasionally, when they have been in want of gold, particularly during the six months previous to March 1798, they have raised the price 4d. per oz. to encourage the importation of it; so that they then paid for it 17s. 10d. per oz. being the full mint price. But, as stated in another place, the average price, which these directors have paid for gold, during the before-mentioned twenty years, was 3l. 17s. 7d. per oz. or 2d. per oz. less than the mint price; so that the variation in the price of gold has not amounted, during the whole of this period, to $\frac{1}{4}$ per cent. It appears, by the account before-mentioned, received from Mr. Garbett, that during the forty years in which he has bought and sold gold bullion, as a refiner, the price of gold purchased with bank notes has varied in London nearly $5\frac{1}{2}$ per cent. It is true, that by the same account the price of gold has varied in a greater degree at Paris, Amsterdam, and Hamburg, but by no means in the same degree as silver.

Repetitions follow of what had been said before, together with a list of precautions necessary for regulating the principles of coinage, a statement of objections, and a detail of the condition of British coin from 1760 to 1774.

The art of assaying is described. An account of the several ways of calling in deficient coin is given. This might have been a more curious chapter: for the principles of the plan of compensation adopted toward the holders of clipped coin in 1774, we are referred to the books of his majesty's treasury. What was in print before is so carefully re-printed, that where something could have been added to the current stock of information, it ought not to have been idly withheld. The Spanish dollars, the copper coins, the state of the mint, the expediency of reviving the office of exchange, the effect of paper-currency on the value of bullion, are progressively discussed. To the conclusion succeeds an appendix.

With respect to the plan proposed, we agree with the noble author that it would be more convenient to coin and circulate pounds and half-pounds, than guineas and half-guineas, which are the present fractional measures. It would also be convenient if ten pence made one shilling. We disagree with the noble author in his doctrine concerning seigniorage. He objects to levy a seigniorage, and would have the guinea circulate for its value as bullion. The consequence of not levying a seigniorage is, not only that the coinage becomes a needless expence to the public, but that at any slight rise of bullion it becomes worth while to melt down the coin; whereas, if it circulates for three or four or five per cent. above its intrinsic value, the little fluctuations of gold and silver do not afford a sufficient temptation to melt down coin. The prodigious destruction of British coin during the present reign, which has rendered such vast coinages necessary, has resulted from the non-levy of a seigniorage. Gold is worth something more for having been weighed and assayed, and separated into pieces of convenient size. A heavy seigniorage affects prices.

With respect to the treatise itself, it displays an extensive acquaintance with domestic writings on this topic; but the foreign authorities quoted are too few to arrogate the praise of comprehensive reading. Boizard's *Considerations sur les Finances*; Bercaria's *Trattato delle Monete*, with Vasco's subsequent remarks; the

short essay of *Hermes Verbesserung des Minnewesens*, are among the first that occur to us as unquoted. Perhaps, however (except in questions which respect the law of nations), the statesman does well to appear to be governed by domestic ad-

vice, even when he avails himself of foreign illuminations. Nations execute with more pleasure, and vaunt with more pride those laws and regulations, for which they suppose themselves indebted to native intellect.

ART. XXVI.—*Considerations on the best Means of insuring the internal Defence of Great Britain.* By CAPTAIN BARBER, commanding the Duke of Cumberland's Corps of Sharpshooters. 8vo. pp. 63.

THIS accomplished officer advises a compulsory training to the use of arms of our whole male population between the ages of eighteen and forty-five. He is not for beginning young enough. The Athenians set about teaching the military exercises at sixteen. The supple limbs of adolescence more easily acquire the arts of warfare; and the captatious fancy of lads is more easily attracted to the business. The growth of the body ought not to be completed, when any given employment is first undertaken; because the muscles chiefly called into action will else not accommodate and proportion themselves to the requisite exertion, and not assert in their organization a preference of vigour and mobility.

Compulsion is a grievous, and ought therefore to be a late resource. By a tax on apprentices, shopkeepers, footmen, students, clerks, waiters, journeymen, and other occupations of the young—to be levied by taking out a licence, and withdrawing it in favour of those who attend a given number of musters—all the desirable and expedient indirect compulsion may be brought to bear. The rich would decline the trouble, unless for the sake of the rank of officers. This is well. The habits of the luxurious unfit them necessarily for the camp, and for the hardships of efficacious military effort. They would die of disease in the seasoning. Rheumatism and dysentery make bad fusileers.

Let the opulent be induced to keep aloof from a service which they would injure. Play, or pay. Our army is the worse for being officered by so elevated a

class. The French army has been improved precisely by being vulgarly commanded. Generals have often less work to do; soldiers always: the repugnance of educated natures would be success. The greatest warrior among modern sovereigns was Frederic of Prussia, and the greatest blackguard. The troops of Pompey were gentlemen, and were beaten: Cæsar had the mob, and the victory. Under the later emperors the Roman discipline declined fastest when it was most most genteel to hold a commission. The barbarians supplanted the refined Italians and Greeks. The military virtues are unnatural to the well-born. Rank should be fought for, not sold. Excellence in war deserves the highest recompences of the state; but it is a kind of worth, which sagacity will seek on the lower, not the upper steps of the social pyramid.

Captain Barber seems aware of this; he says, p. 53, "I believe this statement to be correct, that the volunteer corps, which are considered the most genteel, have much worse musters than such as are composed of the ordinary classes."

He strenuously recommends black belts, browned muskets, ordinary hats, and cropped hair, to all volunteers: and he especially insists on the multiplication of the sharp-shooters. Their peculiar efficacy against invaders is justly noticed. Perhaps the privilege of killing game, without the expence of a licence, or the necessity of a qualification, ought to be conceded, as a patriotic encouragement, to every member of a rifle-corps.

ART. XXVII.—*Observations on the Duty on Property.* By the Rev. L. HESLOP, Archdeacon of Bucks. 8vo. pp. 37.

SEVERAL persons in this country are friends of taxation in the abstract, and affect to think every seizure of individual property for public purposes is a meritorious act in the state, and a victory of general over personal interest. If this prin-

ciple were carried to the utmost, nothing would be left in the possession of the subject, but the means of paying for his yearly subsistence; and the whole superfluity of his earnings, and the whole accumulation of his economy, would be

confiscated under the forms of law, and squandered in those speculative armaments and distant expeditions, by which ministers contrive to annihilate the many millions they levy.

To this dangerous sect of tax-admirers belongs the reverend author of the pamphlet before us. He assures us that the property-tax is just, *because* the duty to be paid is in proportion to the property to be protected. It follows that all proportioned taxes, however needless, are just. He also assures us that this tax is politic, *because* the object of our insatiable enemy is not only conquest and dominion, but to plunder and seize the whole property of the kingdom to enrich himself. It follows that all taxes whatever are politic, provided our enemy is as insatiable as our own exchequer. Such is the marvellously admirable and convincing reasoning of this learned archdeacon.

He tells us further, that the exemptions

and abatements under the property-act extend too far; and proposes a number of new rules for eroding and diminishing these deductions. He thinks, and truly, that the occupiers of land are privileged against their share of this tax in an unfair and unwise degree; which facility given to the landed interest is, like the successful opposition to the horse-tax, a natural consequence of the large proportion of land-owners who sit in both houses of parliament. He finally treats of the duty on tythes, which is considerably the most intelligible portion of the book.

If the tythe were every where converted into a modus; and such modus allowed to be redeemed by individual proprietors at their pleasure, after the manner in which the old land-tax was extinguished, the difficulty of ascertaining and assessing duly this vast source of income would be sensibly alleviated.

ART. XXVIII.—*Treatise upon Tythes; containing an Estimate of every tytheable Article in common Cultivation: with the various Modes of compounding for the same.* By the REV. JAMES BEARBLOCK, A. M. 8vo. pp. 73.

MODERATION, as it is called, has hitherto been characteristic of the English clergy: with vast rights over the produce of the soil, they have been content to compound for a moderate portion of their dues, and to accept, instead of kind, which varies in value, a certain yearly allowance less than equivalent. There is much of virtue, something of ignorance, and something of indolence, in this conduct. A grey-coat parson, such is the nick-name given to a lay-proprietor of tythe, usually exacts more than his contiguous ordained brother.

This treatise will operate diffusively to abolish clerical moderation. It will dispel the ignorance, and relieve the indolence, of those who are moderate from helplessness. It teaches, in a simple intelligible form, the art of rendering tythe productive. It provides arithmetical tables for casting up, by the bushel, the value of wheat, rye, and barley, of oats, beans, and pease; for casting up hay by the load, and potatoes by the ton. The art of composition, not for homilies, but for salary, is

instructively inculcated, under its several subdivisions of composition by valuation of crop, by annual agreement, and by permanent modus. Nor is timber forgotten; or the strange exaction on the earnings of industry, to which millers are exposed. This personal tythe, notwithstanding the intimation to the contrary in Burn's Ecclesiastical Law, we apprehend to be no part of the law of England: it is a second assessment of the same corn.

Levitical law, which the clergy call divine right, refuses the tythe on subsidiary crops, and ordains the levy to be triennial.

One good effect may flow from this book: by familiarizing the real value of the tythe, it will facilitate a just commutation. The redemption of the tythe, after the manner in which the old land-tax was redeemed, might easily succeed to a commutation; the property of the church would then be embarked, where it ought to be, on the same security with that of the stock-holder. This would stabilize the funds, and augment the national power of borrowing.

ART. XXIX.—*Thoughts on public Trusts.* 8vo. pp. 203.

THE Memoirs of Planetes are deservedly recollected for an Attic plainness of style, for close specific simple reasoning, for a classical range of idea, and a level-

ling philanthropy of sentiment. These thoughts on public trusts have originated with a pupil of the same school. They are likewise inferences from too exclusive

a consultation of the scanty records of ancient experience: they have a similar neatness of garb, and an analogous more than republican tendency. As in Ogilvie's *Essay on the Right to Property in Land*, so to this author agrarian propositions appear worthy of legitimation. As in Condorcet's *Constitution for France*, so to this author the decision of the multitude in their local assemblages appears more conducive to the national interest than the concentrated wisdom of elected deputies. The analysis of the government of ancient Rome is the text to which he attaches his political homily: in Rome, he manages to find models for the institutions he recommends: there was realized the social paradise he aspires to create anew. France is his bottomless pit, whence every deterring instance is withdrawn.

The first chapter gives, or professes to give, a cursory view of the Roman constitution, from the building of the city to the 385th year of the republic. What do we know of these early times? Nothing trustworthy. Herodotus, the earliest historian of the ancients, did not flourish before the fourth century of Rome, and he unfortunately had not travelled into Italy. At the close of that century Rome was taken by the Gauls, and burnt to ashes. The records, the public monuments, all perished. An anarchy of five years suspended every habit of authority and obedience. Camillus was the true founder of Rome; with him begins its credible history, and all the causes of its greatness.

Festus gives us to understand that the antiquity of the city was computed from the number of nails found in a given wall; and that the driving in of one annually had supplied the place of annals, before the use of letters. Livy expressly testifies that the art of writing was very rare; and that the commentaries of the priests, as well as other public and private documents, had been burnt in the conflagration of the city by the Gauls. No possible source of intelligence could exist concerning the previous period. It was not until a decree of the senate, passed in the year 450, under the consulate of Publius Sulpitius Averro and Publius Sempronius Sophus, that the Romans began to compile trustworthy public records: this decree withdrew from the priesthood, and placed under the civil magistrate, the care of the archives. *Fasti* were at that time forged by one Cneius Flavius, in the

name of Numa, and were then first promulgated and engraved on brass. Plutarch, in his life of Numa, quotes the testimony of the chronologer Clodius, to prove the falsification of these pretended documents; and the judgment of Polybius assents to the same fact. Archives taken from the priesthood, in the year 450, must have been taken from them, because they were imperfectly kept; it is likely that the very lists of consuls, back to the year 388, when the dictatorship of Camillus terminated, were found incomplete. The previous lists of military tribunes, if authentic, ought to pass for a census of the army of Camillus, which resettled Rome; that is, for cotemporary names, rather than for a pedigree of the republican magistracy.

The pretended historical notices of the times before Camillus being thoroughly insupportable, no inferences from experience may be founded on the study of that period.

In the year of Rome 620, Tiberius Gracchus proposed to revive the execution of a law of Licinius, enacted in 385, which was said to have limited the agrarian property of citizens to five hundred acres. This was an attempt to supersede the prescriptive rights of property on a ground of statute law; and may be compared with certain English attempts to confiscate without indemnity those burghage-tenures, which are avowedly venal, in defiance of institution; or to annul sales of adwosons, which ecclesiastical prejudice considers as simoniacal. It was more strictly an attempt to convert a land-tax into a rent-tax, on the ground that the original land-tax had been proportioned to the rental. Confiscations have seldom been scrupled by non-proprietors. Until the commercial forms of property had become numerous; until it was perceived that these forms of property, which are very moveable, immediately fly from the land where they are not superstitiously respected; the doctrine of the inviolability even of property, founded on mere prescription, was little thought of. But the habit of possession, and the threatened interruption of that habit, were felt then, as now. Tiberius Gracchus, instead of being refuted, was resisted in arms; and was murdered by the party, whose possessions he threatened to disturb. After this event, our author thinks the government of Rome too disorderly to furnish precedents for legislation: so that to a narrow period of little more than two

hundred years must be restricted the exemplary portion of the Roman annals.

During these only two pattern-centuries the form of the Roman constitution is quite uncertain. Hear our author.

"Historians seem to have been also inaccurate in stating the manner of appointing senators. Some of them say positively, that when the first hundred were appointed, each of the three tribes chose three, each of the thirty curia chose three, and that Romulus chose one; and when another hundred were added, upon incorporating the Sabines, it is expressly said that they were chosen by the people; yet others say that the kings, and afterwards the consuls and censors, had the power of nominating the senators.

"It is probable that this seeming contradiction was owing to the notoriety of the people's power at the time, which made historians think it necessary to mention it in every case. For the same reason they frequently call a law, the law of a certain consul, yet they do not mean that he enacted it. In like manner, when a king is said to appoint senators, they mean that he presided at the meeting; and suppose it to be understood, that the votes, or approbation of the people, determined the matter, as in the case of enacting laws. That such is their meaning appears more certain when we reflect, that Livy, and other early historians, use, indifferently, both modes of expression. But what is most conclusive, none of the historians have denied the authenticity of those narratives which state, that the people elected the senators, and pointed out the particular manner of electing the first hundred, which they would have done, if they had supposed that those narratives contradicted their own accounts of these transactions.

"We are therefore to suppose, that the Roman historians understood these expressions, that the king, consul, or censor, nominated senators, as implying, that it was done either with the actual votes, or with the concurrence of the people. That the power of the people in that matter was so well known, that the mode of expression could not be misunderstood; as English historians, for the same reason, frequently call an act of parliament, an act of the king or his minister.

"Though the votes of the low ranks were of no use when taken by centuries, yet their presence in the assemblies was necessary, to support their tribunes, who had a legal right to stop public proceedings. It was by that power, and by their forming a legal head to the plebeians, that the tribunes were enabled to force the patricians (after many violent altercations, and being frequently on the brink of civil war), to yield up all the exclusive privileges which they had usurped when the consular office was established, and which they had acquired by the new method of voting; to allow the poorest Roman an equal vote with the richest in enacting laws, and

to be equally eligible to offices, which had been the constant practice in Rome, from the building of the city until the method of taking the votes by centuries was established."

Here is a theory of the Roman constitution, which begins by imputing inaccuracy to the historians. The writer is himself aware that he does not talk from his book. The routine of office among the Romans was this. A public character first solicited to become *quæstor*. In the early ages this was a mere collector of the taxes: in latter times it corresponded with a receiver of the revenue. It was a profitable office, and founded for the holder a permanent prosperity. The lenient *quæstor* became popular, and could pursue a tribuneship, which was conferred by the universal suffrage of the citizens. The strict *quæstor* acquired the support of the government-party, or optimates, and could pursue an edileship, which was for a long period conferred by corporations, called *centuriate assemblies*. The *edile* was expected to bleed freely, and to carry through his office a magnificence proportioned to his supposed profits. The splendid *edile* became *prætor*, a civil magistrate. The respectable *prætor* became *consul*, a military magistrate.

Where lay the nomination of the *quæstors*? Clearly, we apprehend, with the consuls: for Tacitus tells us, that until the year 307 the mere nomination by the consul was a valid election. Where lay the election of the *quæstors* afterwards? Clearly, we apprehend, with the *comitia tributa*. In many of our county elections the poll is taken by hundreds; the residents in each hundred voting at a peculiar booth. If at such elections the majority of each hundred told as a single vote, and the election was decided by the majority of hundreds, this mode of voting would resemble the *comitia tributa*. The tribunes, and latterly the *ediles*, were elected in the same manner.

But the higher offices of the state, those to have served which bestowed for life a seat in the senate, were in the gift of the centuries, or *comitia centuriata*. And what were the centuries? An arrangement of the Roman people depending on the amount of their income-tax. The non-payers formed collectively but a single company, or century. Those whose income was rated at 12½ thousand pence of brass, were divided into thirty centuries; each of which companies decided by an internal majority, like the tribes in the other form of election, concerning any

candidate, or law, and gave in their corporate capacity one vote: so that this class had thirty votes.

Those whose income was rated at 25 thousand pence of brass were divided into twenty centuries; so were those whose income was rated at 50 thousand; and so were those whose income was rated at 75 thousand: these three classes had in all sixty votes.

Those whose income exceeded 100 thousand pence of brass were divided into eighty centuries. Here is a list of only 181 centuries: but mention occurs of 192 centuries having voted: it is probable, therefore, that the equestrian order was separately divided into centuries; and, as round numbers prevail in the whole arrangement, that it was divided into 20 centuries: making in all 200 centuries, beside the class of non-payers, which, in case of equal division, had a casting vote.

As soon as the men of 100 thousand, and the men of 75 thousand, had polled; if they were nearly unanimous, an election was decided. The appeal was made to a lower and a lower class, only in proportion to the dividedness of opinion among the optimates. The Roman constitution, therefore, as far as respected the higher grades, or the election of prætors, consuls, and senators, was a government by property: or rather by those forms of property which contributed to the revenues of the state. He who thinks this government practically good (we think it at every period of the Roman history disorderly and oppressive), ought to advise, in Great Britain, the transfer of the choice of both houses of parliament to the payers of the income-tax; and that the number of votes, or quantity of influence, entrusted to an individual, should be proportioned to the amount of his assessment.

Instead of such very practicable change in our institutions, this writer suggests the following plan of constitution:

"Divide the country into provinces of such extent, that the most populous shall not contain above 1,500,000 souls; and in the least populous, that few of the inhabitants be above forty miles, or a day's journey, from the place of provincial meetings. Each province to be divided into districts of such extent as that there shall be at least four or five districts in the provinces of the least extent; and in the least populous parts, few of the inhabitants should be above fifteen miles from the district meetings, that they may go home in the evening. Lists to be made up of all the men in each province above forty years of age. Every three hundred of these, living

most contiguous to form a ward, and to meet in a church, or some other convenient place, on a certain day annually, to elect two provincial senators, and one warden or judge for the ward. These three officers must be forty years of age, and resident in the ward for which they are elected, or in one that is adjoining. These ward voters also to elect, at the same time, a vicewarden and sixteen jurymen, each forty years old, and resident in the ward.

"The wardens, vicewardens, and jurymen of every twenty contiguous wards in the nation, to elect out of their respective provincial senators, two men to be national senators; these to continue to be also provincial senators.

"The great national officers to be elected by all the senators, wardens, vicewardens, and jurymen of the nation, annually, the votes to be taken in their respective districts. These men to elect a consul, a viceconsul, and also such a number of generals, admirals, superintendants of the revenue, of the navy, of the ordnance, and such other national officers as the senate may judge necessary.

"The senators, wardens, vicewardens, and jurymen of each province, to elect annually one of the senators of the province to be governor; also to elect two judges, a public prosecutor, and colonels and majors of militia for the province.

"The senators, wardens, vicewardens, and jurymen of each district to elect annually one of their senators to be prefect or governor; and also to elect captains, lieutenants, and ensigns of militia for their district.

"In towns of more than one ward, the senators, wardens, vicewardens and jurymen, to elect one of the senators or wardens to be chief magistrate.

"It is usual to choose the generals of brigades from the colonels; but as the merits of colonels of militia cannot be known to all the magistrates of a nation, it seems to be proper, that the magistrates of two or three adjoining provinces should elect the generals of brigade. This method may also be adopted for electing other public officers whose sphere of action is local, and whose conduct can only be known in the neighbourhood, such as superintendants of public stores, of building ships, &c. care being always taken that the number of electors be so great as to prevent them from making it a job.

"As it is necessary that the society shall prevent, with jealous care, any man or set of men, from acquiring absolute power over their persons or property; they should be at all times prepared to defend themselves against internal or external enemies, by being properly organized, and regularly exercised as militia, in some prudent rotation till a certain age.

"When a standing army is judged necessary, the officers may be elected by the same persons who elect the officers of militia.

"Method of conducting public business.

The consul to have a seat in the senate, and, as agent for that supreme council, to have the charge and direction of all national affairs, to correspond with foreign nations, to lay before the senate such schemes as he judges necessary for conducting public business, estimates of expenses, and every other information that is requisite to enable the senate to form just views of the situation of the society, that such schemes may be adopted as are most likely to promote the public welfare. The consul also to correspond with the governors of provinces, with the generals, admirals, and other public officers, and to give such orders as he thinks proper for conducting public business according to the intentions of the senate, but to have no military command.

"The viceconsul to preside in the senate, and in the event of the consul's death, or being incapacitated, to officiate as consul.

"The national senate to meet on a certain day annually, and to have supreme controul over all the current national business, over the military force, over the consul and all national officers; and, when it judges proper, may propose a law or a tax, or to engage in a war; and if no objections are made within a certain time, the laws are enacted, and the war declared in the name of the people; silence being taken for their consent. But if an actual majority of the ward voters, or of the wardens and jurymen, give instructions to their respective senators to vote against any measure, they must vote accordingly: and if a majority of senators are instructed to vote against a measure, it must be given up.

"The senate is not sovereign: it is a select committee, composed of men of the highest rank and of the greatest abilities, chosen by the society to superintend their common concerns. It is but proper, therefore, that the wardens and jurymen, who are of the middle ranks, should have a negative upon laws or engaging in war. And to protect the lower ranks from oppression, it is necessary that the majority of ward voters, which includes every rank, should also have a negative. It is equally proper, that the majority of the ward voters, or the majority of the wardens and jurymen, should have power, at any time, to instruct their respective senators to annul any law enacted by the senate, the evils of which were not foreseen when it was enacted. But instructions from the wardens and jurymen are not to be regarded, when opposed by instructions from the ward voters.

"But it would be extremely imprudent in a society of free men to put themselves in the power of the senate, by making it necessary for all laws to originate in that council. Any individual of the society, therefore, has liberty to propose any law, but no power to call any meeting of the people. But if an actual majority of the ward voters approve of it, they may give instructions to their respective senators; and if a majority of senators are instructed to vote for the law pro-

posed, the senate must enact it. And laws thus enacted, by instructions of a majority of the ward voters, cannot be annulled but by the same sovereign power.

"When instructions are given to enact a law, to annul a law, or against a law proposed, it is evidently necessary, that the vote of each senator, who has received instructions, be counted, whether he is or is not present in the senate."

In the first place, why are men of forty alone to vote? Was the author born in 1765, and willing to level down to himself? The lives of youth have been tyrannically flung away by the rulers of France, in consequence of confining suffrage to those above twenty-five. The conscriptions press precisely on the class so excluded from suffrage. What man ever became excellent as an orator, to whom the senatorial arena was shut until forty? By whom but by young tribunes and representatives have the interests of the people been ardently advocated? The old age of a patriot, or a general, is seldom worth his youth.

In the second place, why should the stability of public laws and institutions be exposed to the custody of any single body of men, whose powers are delegated and revocable? Such republics are overturned, of course, by the generals of their own creating; by their Cromwells and Bonapartes. Some form of hereditary institution, not liable to be cashiered by dispersion, or by the voluntary revocation of power, is the strongest counteracting force to military usurpation. Before this check be withdrawn, a substitute antagonist force ought to be devised.

In the third place, why are the instructions of the people, or of the forty-year-old constituent body, to be held imperative? Wise decision is the object of senatorial deliberation. It is more likely that representatives, who ought to be chosen for their superior political insight, will decide aright, than the less leisurely, less instructed, constituency. The want of independence, not the want of wisdom, is the cause of what of oblique may be remarked in the votes of the parliament of Great Britain. It would be a wiser body, but perhaps a less independent one, if the qualifications of property were withdrawn, which narrow eligibility to those classes whose youth is too opulent to be industrious.

We could make further objections; but, as the speculation is not about to be realized, a complete discussion is needless.

It will be read with amusement, if not with conviction; and will familiarize the art of reasoning about governmental con-

stitutions, if it do not form a sect, like the schemes of Harrington and Hume.

ART. XXX. *Inquiry into the permanent Causes of the Decline and Fall of powerful and wealthy Nations.* By WILLIAM PLAYFAIR. 4to. pp. 300.

A NATION may produce a great crop of military merit at one period, as England did under Edward III.; a great crop of naval merit at another, as under George III. Literary excellence may abound most when public power is on the decline; as was the case of Great Britain, during the reign of James I.; and of France, during the reign of Louis XV. Wealth and the arts may attain their acme, as at Florence and Rome, under Leo X., when morals and liberty are disappearing. National welfare is a combination of various sources of comfort, of strength, and of glory: its decline ought not to be dated by the occasional decay of any one specific form of human competition.

There is something of antagonism between many of the desirable national qualifications. Opulence is naturally hostile to military greatness, by causing a less hardy rearing of the poor, by patronizing finger-work and sedentary manufactures, by accustoming the officer-classes to luxurious and delicate living, and by directing the attention of statesmen to the most orderly provisions for quiet, for security, and for defence. Yet the armies of Titus and of Trajan were formidable, while the wealth of Rome was at its highest pitch.—Poverty is naturally hostile to literature and the fine arts; by uprooting the leisurely classes, who can alone cultivate them, and by intercepting the demand for their productions. Yet Germany, which is less wealthy than Britain, has produced within the last thirty years, a greater crop of literary excellence; and has evolved more enthusiasm for art, if she has not displayed equal accomplishment. Equality is naturally hostile to politeness and refinement, but favourable to liberty and to justice. Commerce always generates morals; both pecuniary probity, and domestic chastity; but it is not so habitually accompanied with courage, with honour, with frankness.

The most essential ingredient of national welfare is power. Without sufficient strength to defend its own independence, a nation cannot but feel that every form of prosperity is precarious. What have availed to Geneva and Switzerland their morals and their liberties?

What to Venice and to Holland their commerce, their wealth, and their public order? What to Portugal and Spain their colonies? What to Italy the arts, or to Germany her learning? All these things are bowled down before the cannon-balls of the conqueror; or suffered to subsist only inasmuch as they can be rendered subservient to his aggrandisement. If therefore national decline is to be measured by any single standard, that standard ought to be military strength. Without a conscious power of self-defence, independently of subsidiary tributes to those royal *condottieri* who undertake warfare so make a profit by their soldiery, to flourish is but to invite partition.

Let us apply the gage, military preponderance, to the chart of Mr. Playfair; we shall find new lines of contour superseding his. The French revolution, which, with him, makes a great rift downwards in his silhouette of the mountain-summit of French super-eminence, will be found to elevate rapidly its pinnacles, and pile a Pelion on Ossa. What can Mr. Playfair mean by making wealth, commercial wealth, the great, the single standard of substantive excellence among nations! On this principle he ought to rank Egypt higher, after it became a Roman province, than while it obeyed the Ptolemaic dynasty. Alexandria derived an increase of demand and of prosperity from annexation to the Roman sway: yet who would place under Hadrian the acme of Egyptian greatness?

If Bonaparte had superseded the dynasty of the Guelphs, and were lording it at Windsor as he does at Shōnbrun, he might leave the present channels of commerce open, and add the opportunity of continental demand; but should we place at such a period the high-water of the tide of English greatness? No. Vile indeed must be the spirit which, for the sake of selling a yard or two more of calico or calamanco, would submit to the dictation of a foreign force, and hold at foreign mercy even an improved prosperity.

Let us then not confound the decline and fall of nations with a diminished demand for long ells or broad cloth, with a

cheapness of coffee, or a cheapness of turnip-seed. Let bankers sigh over the fall of stocks, and nobles over the fall of estates; these things, like the men who vest property in them, may pass away, and the nation remain stronger than ever. It is when recruits throng not to the standards of a country in danger; when pressure is inefficient to man its navies; when citizen-soldiers abound by exempting them from ballot and conscription, that there is cause to tremble.

To prolong the prosperity of the British empire is an important study and pursuit: but the means adapted to preserve its wealth may be adverse to those for preserving its power. Power, like time, is the foundation of longevity; wealth, like space, the foundation of extension. France, depending on men and iron, is likely to outlive; as Britain, depending on men and gold, is likely to outspread, every other nation. In Asia, in America, a British population is domesticating her language, and universalizing her manners: but each of her children will, in turn, lay claim to emancipation, and perhaps not conspire to protract her individuality.

The system of Mr. Playfair may in a great degree be gathered from the following passages:

"We shall see that the first revolutions in the world were effected by the natural strength, energy, and bravery of poor nations triumphing over those that were less hardy, in consequence of the enjoyment of wealth, until the time of the Romans; who, like other nations, first triumphed by means of superior energy and bravery; and afterwards by making war a trade, continued, by having regular standing armies, to conquer the nations who had only temporary levies, or militias, to fight in their defence.

"The triumph of poor nations, over others in many respects their superiors, continued during the middle ages, but the wealth acquired by certain nations then was not wrested from them by war, but by an accidental and unforeseen change in the channel through which it flowed. At the same time that this change took place, without the intervention of force, the art of war changed in favour of wealthy nations, but the changes took place by slow degrees, and the power of nations now may almost be estimated by their disposable revenues.

"This change, however, has by no means secured the prosperity of wealthy nations; it has only prevented poor ones, unable by

means of fair competition, to do, by conquest, what they could not effect by perseverance in arts and industry; for, in other respects, though it makes the prosperity of a nation more dependant on wealth, and more independant of violence; it prevents any nation from preserving its political importance after it loses its riches. It does not, by any means, interrupt that progress by which poor nations gradually rise up and rival richer ones in arts. It has not done away the advantages that arise from superior industry and attention to business, or from the gradual introduction of knowledge amongst the more ignorant, thereby lessening their inferiority, and tending to bring nations to a level; on the contrary, by increasing the advantages, and securing the gradual triumphs gained by arts and industry, from the violence of war, it makes wealth a more desirable object, and the loss of it a greater misfortune. It tends to augment the natural propensity that there is in poor nations to equal richer ones,* although it, at the same time, augments the difficulty of accomplishing their intentions.

"The superior energy of poverty and necessity which leads men, under this pressure, to act incessantly in whatever way they have it in their power to act, and that seems likely to bring them on a level with those that are richer, is then the ground-work of the rise and fall of nations, as well as of individuals. This tendency is sometimes favoured by particular circumstances, and sometimes it is counteracted by them; but its operation is incessant, and it has never yet failed in producing its effect; for the triumph of poverty over wealth, on the great scale as on the small, though very irregular in its pace, has continued without interruption from the earliest records to the present moment.

This speculation is, in our opinion, very inexact. The seats of trade become rich; but poor nations, as such, have no tendency to become seats of trade. The Scotch of late, as the Swiss during the preceding century, furnished to all the great commercial cities a large proportion of the superintending skill: from clerks they have become merchants, and have acquired vast wealth. Yet Switzerland and Scotland are not much enriched by the foreign success of their expatriated children: few bring home the rewards of their toil. The countries being mountainous, and therefore barren; the streams innavigable, and therefore useless; traffic cannot attain there an eminent activity. Geographical adaptation must coincide with that of the people, for any district to become very commercial. The mouths of

* The present inferiority of Poland, Denmark, Sweden, Spain, and Portugal, compared with the rank they held in former times, is easily accounted for by looking at the scale of their revenues.

great rivers form the natural dwelling-place of trade: Alexandria, Thessalonica, Venice, may resume their ancient consequence; but Constantinople, Genoa, Naples, owed to accidental causes their greatness, and are probably in an irrevocable progress toward declension.

The radical cause of the migration of prosperity depends, according to Mr. Playfair, on the altered habits of education, which wealth always introduces.

If this theory were true, there ought to be no national declension any where: because, as all poverty must perpetually operate to generate the habits of frugality, industry and spirit; and as poverty is the perpetual destiny of two-thirds of the community; a great majority of the people must every where be stimulated to preserve sound habits; and the causes of decline could only attack a luxurious fraction of the nation, whose relapse into the lower classes would scarcely be felt.

The power of a nation is as the number of persons trained to arms; and the wealth of a nation is as the number of persons trained to industry. The difficulty consists in domesticating, in naturalizing, in fixing to the soil, the various forms of employment. The artisan must follow his work. When a town is built, and there is no further demand for houses, the builders must gradually disperse, and attach themselves to other masters, in districts not yet overbuilt. When the demand for calicoes abates, the weavers must quit their employers, and seek, under the makers of hempen and linen cloth, for analogous occupation. Our manufactures are limited, not by the possibility of make, but by the possibility of sale. So our commerce: if the continent wanted twice the quantity of sugar, and coffee, and cotton, we could cause them to be grown: a small rise in these articles, if it endures for a year or two, will induce the planters to take the requisite additional grounds into cultivation; but when the average produce comes up to the average consumption, that sort of commerce is full: no more hands can be busied in it with utility. If war raises the freight and insurance in English bottoms, so that the coffee and sugar of the West Indies can be carried more cheaply to Europe in American bottoms; and thus be landed at Hamburg and Petersburg, subject to fewer charges than are incurred at Liverpool and London; the coffee and sugar will find that cheapest road, and draw after them, from

Liverpool and London, the requisite capitals and superintendence.

The principal revolutions of commerce have resulted from the discovery of a cheaper route of transportation. The merchants successively remove their counting-houses, and their capitals, and the dependant labour, to the most convenient sites of emporium. The houses which flourished one war at Ostend, blossomed during the next at Hamburg: a long belligerence may cause them to strike root in Tonningen or Riga, if the old ports cease to be considered as neutral.

A vast portion of the trade of the world consists in *thoroughfare*: in the moving of commodities through a specific country, while on their progress from the place of production to the place of consumption. The increase and accumulation of custom-house duties, and dock-charges; the exorbitance of mercantile profits, rendered general by the profuse luxury, or profuse taxation of the traders; the accident of war, which, in the form of freight, insurance, or convoy-duties, has often successively assessed one particular route of transportation; the new geographical position of the seats of production and consumption; have all a greater or less influence on the trade which consists in transit.

Most of the instances of declension adduced by Mr. Playfair, are more simply resolvable into the discovery of a cheaper route of transportation, than into a supposed effeminacy, and incapacity of exertion, infecting the enriched countries. Babylon and Tyre flourished, while they conveyed the commodities of the luxurious and manufacturing East into the rude and newly-settled countries of Europe. The wars of the Greeks and Persians, by interrupting the intervening protective police, caused this trade to seek the securer, and therefore less expensive, channel through Alexandria. During that interval in which the Syrian isthmus was again secure from the Arabian robbers, Palmyra and Antioch rose into great consequence. Anarchy again drove the trade back to the isthmus of Suez, and through Alexandria to Venice and Barcelona. Something depended on the chief seat of consumption, which at first was *Natalia* and Greece, next Italy, and then Spain and France. The migration of trade was timed by the diminution of security, and executed by the progressive situation of demand.

Demand for foreign produce always &c.

minishes with the cultivation of a country. Many of the arts of manufacture are progressively introduced and exercised at home. Russia, which imports beer, might brew it. Spain, which imports silk stockings, might weave them. England, which imports linen, is learning to buy the flax raw. It is in consequence of the internal progress of industry that the ancient markets fall off. Thus Germany now buys comparatively little of the British manufactures, and that for Poland, Hungary, and the ruder nations behind.

When the Portuguese first explored Hindostan by sea, Portugal became the great transit for every thing oriental. But Portugal was well situate only for the demand of the Spanish market. The Dutch took in hand the same trade: it was a cheaper course for the middle zone of Europe to import up the Rhine, and the contiguous rivers, than from Lisbon. The trade therefore migrated, without any fault of the Portuguese. When the Spaniards first discovered America, they rather attempted plunder than interchange: the public revenues, and the fortunes of officers and governors, were rapidly growing; but they founded no manufactures at home, for the supply of the colonial market, and they did not direct the industry of their colonies to commodities in general use. Silver, indigo, cochineal, which are forbearable articles, were made the objects of importation. The fashion of using segars and chocolate are the only systematically prudent accommodations of the Spaniards to the expedienies of their colonial agriculture. They have used their colonies as taxable provinces, as instruments of revenue to the state, not as means of increasing the forms of European maintenance. They send out people to dwell there, not to thrive there: so that Mexico and Lima are more advanced in the arts of life than Madrid itself. Nor are the Spanish colonies adapted by nature to be countries of great exportation. They are ill-watered: there are few navigable rivers of consequence, down which the produce of the interior can be cheaply brought: hence the necessity of abandoning all but the more expensive productions to the agriculture of districts accessible by water. We rail at Spanish indolence for deriving nothing but dollars and cochineal from Lima; but it is doubtful whether our own smugglers, who profess to undertake the South whale-fishery, will be able to extract, from the coasts of Chili and Peru, any thing but dollars and cochineal.

With Mr. Playfair's view of the causes of the decline of commerce, the grand remedy would be, as he observes, to universalize education; in order that a sufficient stock of skill to conduct the higher departments of commerce, may be constantly originating in those classes, which are reared in penury, with frugal habits, with a desire to draw riches from whatever source; which are not refined into disinterest, philosophized into contentment, and polished into idleness; but which preserve a due portion of the honest-meanness of our nature, and meekly take every advantage which the laws have not branded with criminality. One set of qualities fit a man to acquire wealth; and another set to use it.

We should be very glad to see the benefits of education extended; but we should not rely on parish-schools for preventing the declension of commerce. The education of the Scotch is very general and well-conducted; so is that of the protestant or northern Germans. Both nations rear a large portion of the clerks and secondary agents of the commercial world. Yet it is not to this universality of education that the prosperity of Glasgow or of Hamburg ought to be ascribed. There is already enough of education in the world to supply the requisite number of merchants' clerks: no situation becomes vacant in the commercial line but that many candidates compete for it: situations will not abound the more for the profusion of candidates.

A distinct sort of effort is necessary to prevent commercial vicissitudes and declensions. This consists in opening fresh sources of demand; either by making treaties of commerce with nations hitherto averse from intercourse, as China; or by founding in the unsettled districts of the earth a civilized population, and thus rearing a nation of customers, as in North America. It cannot be too often repeated that the delta of a great river is in every war the most desirable situation to be occupied by Great Britain. To have occupied Trinidad and Bulam was wise: the island of Marayo, or, as some geographers have it, Maragno, at the mouth of the Orellana, would for a like reason be a desirable acquisition. A settlement there would soon fringe with plantations a vast navigable river, and become the medium of exchange for the commodities of innumerable nations. The chance for acquiring New Orleans at the peace of Amiens was shamefully neglected.

The prosperity of the British colonies

can greatly and rapidly be increased by suffering them to trade with one another. Some commodities, now imported by the West Indies through the mother-country, would in this case not come at all to England, but stop in their way from China or Bengal. But the increase of settlers in the West Indies, which would result from permitting a trade with the East, would make up by another sort of consumption for that lost in the form of East India articles. Besides, the eastern tropical agriculture and arts of life would thus become familiar to the western Indies, and be more speedily naturalized there. The charter of the India company not only retards and paralyzes the prosperity of Asia; but of all those portions of our dominion which might profit by its intercourse.

Without acceding to the fundamental principles of Mr. Playfair, we have derived gratification from his book: it collects from various quarters phenomena relative to the history of commerce: it illustrates them by a copious commentary; and impresses them on the recollection by various coloured charts ingeniously devised, in which curved lines describe the fluctuations of prosperity. The title-page announces disquisitions far more comprehensive in topic than are to be

found in the subsequent volume. The causes of the decline and fall of *commercial wealth* are alone discussed: whereas one is led to expect a theory of national power, and an investigation of the causes which have led occasionally, as in Spain, to the rise and the fall of agriculture, or as in Italy to the rise and to the fall of literature and of the arts. The author promises speculations as various as those of Montesquieu; but the fates of jurisprudence, of religion, of military discipline, are all forgotten, over the tariffs of the custom-house. The style is inelegant, unaffected, but redundant; the same ideas repeated recur with little variation of form in five chapters; Adam Smith is a dilute writer, but his expounder chooses to outdo his fault, and runs into a mawkish exuberance. Time was, when literary epitomizers were in fashion; when a Wynne obtained reputation, by stripping Locke of his endless ambiguity and voluminous tautology. Time is, when literary expanders are vogue, and the materials of a pamphlet in order to be rendered saleable, must be dilated into a quarto. Time will tell when acres of barren paper will be willingly exchanged for a small but fertile garden; and when merit will be measured not by the magnitude but by the quality of its efforts.

ART. XXXI.—*Speech of Mr. Deputy BIRCH, in the Court of Common Council, at the Guildhall of the City of London, on Tuesday, April 30, 1805, against the Roman Catholic Petition, now before both Houses of Parliament.* 8vo. pp. 26.

HAD the law about baking, which passed in the thirty-first year of his present Majesty, included a provision to prohibit selling, or exposing to sale, during Lent, or on meagre-days, oyster-patties and baked custards, lest a superstitious consumption of the same should be made by Roman catholics, in preference to the roast beef of Old England; possibly the injustice of such a law might have been detected by the worthy Deputy. Is it less unjust to prevent a Roman catholic from exchanging his bodily or mental gifts for a portion of that income which the nation offers as a bounty to the soldier, or the barrister; than to prevent his exchanging a part of his income for the food which he prefers? Both are impertinent interferences with the mode of subsistence the most agreeable to the individual. Both tend to narrow the public supply of luxurious support.

The haranguing Deputy bawls out, that

“our religion, our laws, our liberties every thing is at stake.”—By *our religion* he can only mean the monopoly enjoyed by his own sect (the Bucerist, no doubt) of holding public offices. By *our laws*, he can only mean two or three laws which must be repealed to grant the prayer of the petition. By *our liberties*, he can only mean our restrictions on liberty: the catholics ask for the removal, for the withdrawal, of prohibitions: our liberties would be increased by granting their request. This last slang phrase is not merely an idle exaggeration, like the two former; but a glaring, inexcusable, dishonouring contempt for truth.

Next comes an abusive picture of catholic intolerance. A member of the church of England reviling catholic intolerance is a little like the Empress of Russia writing a comedy against lewdness, or Frederic of Prussia composing his *Anti-machiavel*. This church has been the

most intolerant of all the protestant churches, and with even-handed injustice has fired from a double battery the bullets of persecution, both at those who believe more, and those who believe fewer, than her thirty-nine articles. Under one sovereign a hundred and thirty catholic priests were put to death; under another, two thousand presbyterian priests had their revenues confiscated. Not one sovereign educated in her faith has yet

terminated a reign of glory; for Elizabeth was a catholic—William, a presbyterian—and the two first Georges, lutherans, when they acceded.

The Deputy concludes his speech by saying, "*We know in our consciences we shall always tolerate them.*"—The Deputy cannot know in his conscience what is historically false in fact. Inspiration itself cannot unrealize truth.

ART. XXXII.—*Suggestions for the Improvement of the Military Force of the British Empire. By the Hon. Brigadier Gen. STEWART, M. P.* 8vo. pp. 95.

THESE suggestions deserve the attention of government: a great revolution is become necessary in our armed establishment: we have not the removable force which the mere protection and preservation of our widely-scattered empire requires. The continent is concreting into larger masses: its enterprises depend on few wills, and Great Britain has been offered by our hereditary foe, like another Poland, to the quarry of partition. Navies are not a sufficient pledge for independence, habits of military service must pervade the mass of our populousness: and armies far more numerous than heretofore must be made a standing disposable force.

This will endanger our liberty. Submit then. Our independence is a higher care. But measures may be taken to render standing armies compatible with free constitutions. The venality of commissions, though in other respects mischievous, has the merit of connecting the army with the property of the country, and thus with the class most interested in the observation of justice, to the security of which liberty is essential. If rights of suffrage were the recompence of long service, there would be a tendency in the soldiery to defend such rights. The patronage of the army could be transferred to committees of the senatorial bodies. A larger proportion of independent rank, of rank resulting from mere seniority of service, might be tolerated; and the old officer, instead of selling his resignation to his successor, might have specific claims on the state.

After all, is it not a prejudice to suspect that large standing armies tend to strengthen the monarchic branch of any constitution? Did the army side with Charles I.? Did the army side with James II.? Did the army side with Louis XVI.? Has the power of Bonaparte been endangered by any disaffection but that of the army? The imperial dynasty

of Rome was often changed by the army. The whig jealousy of a standing army may well have arisen, from a suspicion that the intruded dynasty would be dismissed in its turn, by a powerful native force. Military revolutions always enthrone the best general. If any power in the community can limit the arbitrium of the chieftain of the armed strength of a country, it is that of an hereditary nobility: they alone constitute a force which cannot be cashiered by dispersion. Representatives of the people vanish before military usurpation; not so patrician families: if the House of Commons never repeats the blunder of voting the House of Lords useless, military usurpations are not to be dreaded.

At all internal risks, let us improve our army. A prudent alteration is proposed at page 22:—

"It appears to me advisable to divide enlistments into the regular service into three distinct voluntary periods, which, when united, should complete a species of twenty-four years, or that period of a soldier's life which intervenes between his sixteenth and his forty-first year. I would place the whole of the army, which is now serving, upon the first period. This should be for ten years; and I would in future cause all recruits to be enlisted for that period. I would establish a second period, which should be for eight years, and for which period a soldier may enroll himself previous to the close of his first period. On entering the second period, he should receive a half bounty, and, whilst serving in it, should have an addition to his pay, and bear some distinguishing mark on his dress. Previous to the close of the second period, a soldier should have the option of re-engaging for the third and last period, which I would term the veteran's service, and which ought not to exceed six years. I recommend that this period be likewise accompanied by pay and distinction on dress additional to the preceding. The soldier who shall have completed his third period of uninterrupted ser-

vices (for to this condition alone would I attach the advantage either of period or pension), should become entitled to half-pay for the remainder of his life, according to the rank which he may have held at the time of his discharge, or served under during the greater part of his third period. I would, moreover give every soldier, who is now in the regular army, credit towards his pension for as many years as he may have already served uninterruptedly, and when the twenty-fourth shall be completed, place him on the half-pay list, although he may not have gone through his three periods, according to this regulation.

"For the cavalry and artillery I would prolong the first period by two years, deducting them from the second; the additional time is in the first instance requisite for the instruction which is peculiar to those services.

"I conceive that the whole of these pensions may be borne on the Chelsea funds, but not necessarily the only bounty which issues from that institution, it being understood that extraordinary cases of service, wounds, or loss of health, shall entitle such soldiers as may be duly recommended to the benefit of it, at any period, as is observed at present: my object is to secure to every soldier who can produce a certificate of twenty-four years service, a comfortable pension for the remainder of his life, without his being indebted for it to any thing excepting the liberality of his country, and his own long services. The pension ought to be according to the pay of the third period, and not of the first; thus, for instance, I will suppose the pay of a private soldier in his first period to be fourteen pence per day, in the second to be fifteen pence, and in his veteran period to be sixteen pence per

day. The half-pay will be thus: eight pence for a private, probably eleven pence for a corporal, and fifteen pence for a serjeant, a proportional increase being understood to take place upon the pay of their ranks. When a soldier abroad shall have completed a period, he ought to be found in his passage home, if he will not re-engage."

The recommendation at page thirty-three, of a levy of boys, merits consideration: the military exercises are learnt with advantage early: and might with less encroachment on profitable labour be allotted in volunteer corps to younger lads. An augmentation of one-third in the pay of the middle class of officers is proposed, and the introduction of a new rank of cadet, or sub-ensign, is ingeniously suggested as a form for preparing the advancement of meritorious serjeants, or other non-commissioned officers, into the commanding and liberal grades of the service. A reform in the guards is for obvious reasons advised.

A vast enlargement of the regular force, an annihilation of the subsisting militia, and a modification of the volunteers into a stationary militia, seem to be objects of admitted expediency. The police, however, cannot be intrusted to a stationary militia: volunteers would object, in case of riot, to fire upon neighbours, on account of the permanency of vindictive feelings. The regulars must be at the call of the magistrate.

ART. XXXIII.—Observations and Hints relative to the Volunteer Infantry. Dedicated to the Earl of Moira. By an Officer. 8vo. pp. 47.

THE best defence against invasion is the fleet, which would probably intercept and sink the great mass of any approaching force. The next best impediment is a flying artillery, mounted on high and broad convex wheels, adapted for being driven rapidly along the sands of the shore.

Against a landed enemy, the regulars constitute the most satisfactory resource, and in case of their defeat, the rifle-corps, who would thin the foreign force one by one very rapidly. But militiamen and volunteers can seldom be brought to such a state of discipline, while in their semi-civil capacity, as to be entirely relied on for formal warfare and pitched battles. The great use of such associations is to drill and train men who may afterwards be regularized. The exemption from ballot was a strange inconsistency in the volunteer system, and has gradually stock-ed the corps precisely with those who shun

real service. One proposal of this officer deserves notice.

"If I might venture to suggest any thing, (which I do with great diffidence) that may, in my opinion, contribute to tactical improvement, I would recommend that the mode of formation should be always in three ranks; and that the third rank consist of pikemen, whose pikes, in the act of charging, should range with the bayonets of the line in front. The impulse arising from this method of forming would be irresistible, as the steadiness of the front rank, from a confidence of their being so well supported, would so increase the momentum of the charge, as to beat down all before it. The pike, likewise, as a defensive weapon against cavalry, is so far preferable to the bayonet, as its length would keep the horseman at such a distance that he could make little or no use of his sword."

Much verbiage occurs about sir Robert Wilson's pamphlet and the battle of Zama: and much just praise of the earl of Moira.

ART. XXXIV.—*Trial for a Libel in the Antijacobin Review*. 8vo. pp. 50.

WHETHER the Antijacobin Review continues to be assisted by a quondam co-operator, who has avowedly passed into the service of Bonaparte, we have not the means of ascertaining: its conduct could not be more favourable to French views if it received direct instructions from Talleyrand. Suppose the French were projecting the invasion of Ireland, (and the comments with which they have accompanied the intercepted correspondence from on board the *Aplin* show that they very lately projected it) what could possibly rouse the numerous classes in Ireland to take part with the foreign invader, in the present circumstances of the empire, but such virulent and bigoted abuse of the catholics, and such daringly personal attacks on their leaders, as have lately been hazarded by the Antijacobin Review, and punished in a British court of justice?

The trial in question is here recorded much at length: the obnoxious passage laid in the indictment runs partly thus:

"Nothing affords such strong evidences of popish dissimulation in Ireland, as the exhortations of the Romish clergy, and the loyal addresses of their flocks. They have commonly been found to be sure presages of a deep-laid conspiracy against the Protestant state; and after it has exploded in rebellion, their clergy generally lament, from the altar, the delusions of the people, and their treasonable conduct towards the best of sovereigns,

and the only constitution that affords any degree of rational liberty; though from the nature of their religion they must have known, and might have prevented it. The dreadful rebellion of 1798, accompanied with such instances of popish peridy, must convince the reader, that no reliance is to be placed on the oaths or professions of Irish papists to a protestant state. Doctor Troy must have known all the circumstances which preceded the insurrection in Dublin, on the 23d of July 1803, and yet he did not put government on their guard. The present administration are convinced of his treachery on that occasion, and yet, for many years past he had been treated at the Castle with the utmost respect, and had even received favours for some persons of his own family."

The jury fined the defendant fifty pounds: Mr. Erskine was counsel for the plaintiff.

We trust that the constituted authorities, in transferring to new hands the administration of our affairs, may be considered as having struck the tents of persecution for ever.

Nihilque præsentì patriæ communis statui magis accomodum foret, quam si mutua concordia in civilibus, tolerantia in sacris, postliminio revocaretur, et in commune consuleretur. Alioqui non majorum, non nostrum omnium, non tot regum fides, non legum majestas, non pax communis, non libertas æquabilis, non æquitas, non respublica stabit.

ART. XXXV.—*Hints to the Manufacturers of Great Britain on the Consequences of the Irish Union, and the System since pursued of borrowing in England for the Service of Ireland*. By the Earl of LAUDERDALE. 8vo. pp. 50.

LORD LAUDERDALE is an active if not an efficacious writer. Last year (III. 250) we noticed a considerable volume of his enquiries: we have now to comment on an additional set of speculations.

Party-men should never blow into flame the smoking discontents of ignorant selfishness. By associating their cause with unwise alterations, they create an impediment to their being employed. When Mr. Pitt's Irish propositions were originally started in 1786, a mean jealousy was excited among the English manufacturers, and meetings of delegates were assembled to express the hostility of the trading world against these projected regulations. What was the result? Mr. Pitt acquired the gratitude of the tradesmen by giving way to their clamour: and a liberal measure, sanctioned by the approbation of

Adam Smith, was lost to the nation for ever.

We class these thoughts with that factious hostility. Does it matter whether our manufactures flourish along the Mersey or the Liffy, along the Humber or the Shannon? Does it matter whether our rents are expended in Dublin or in London? Let it suffice that manufactures will always thrive best where our rents are *not* expended; because it is a necessary consequence of the expenditure of the luxurious to enhance the price of labour. In the absence of its absentees, and in the depreciation of its money of exchange, Ireland is finding a vast premium for the promotion of its manufactures and the increase of its exports.

Again; does it matter whether money is borrowed in Dublin or in London, pro-

vided it be borrowed at the lowest rate? Why should not the minister open a loan-office, and pay dividends on stock, not only at Dublin, but in Jamaica, and at Calcutta? Let every man in these places, who chooses a slice of loan at the price of

the London market, be allowed to subscribe there. Subscriptions will not abound, because money is worth more there than in London. In this way a more diffusive stockhold interest could be created.

ART. XXXVI.—*An Inquiry into the Causes and Effects of Emigration from the Highlands and Western Islands of Scotland, with Observations on the Means to be employed for preventing it.* By ALEXANDER IRVINE, Minister of Ranoch. 8vo. pp. 188.

A thousand years ago it was customary among the northern nations of Europe, whenever food became scarce, to decimate the young people, and to compel the emigration of the superfluous mouths. The ancestors of the Swiss were thus driven from the wolds of Westphalia, and fought their way to a territory among the Alps. Taught by observation, and not by book-makers, the people could then perceive that the condition of stayers is bettered by the exportation of the unsettled and unprovided for. The competition for necessities and for labour being thereby diminished, food cheapens and wages rise: and this facilitation of the means of maintenance incites speedily to new marriages, until a fresh glut of population supervenes. The mother, the sister, may be allowed to weep, who takes leave of an embarking colonist: but the magistrate will say farewell with a nod of approbation. He is aware that by thinning the stock of domestic populousness the recompense of domestic industry will be augmented; that marriages will consequently take place at an earlier age; that vicious intercourse and crippling disease will be less frequent, and the orderly comforts more widely diffused. It is not merely irrational, but immoral, to dissuade emigration; let the preacher applaud, let the poet celebrate, the man who first from the shore led an emigrating colony.

Against instigators of emigration our author is ludicrously embittered. One would think he had listened in his rambling years to some foolish scheme of expatriation, had been trying the profits of authorship on the Ohio, or to preach calvinism under the tin steeples of Canada; and having discovered that the sun shines no where so pleasantly as at Ranoch, was returned a weary, tanned, and disappointed wanderer. Why should he else pursue with an hostility so vindictive the oral geographer who happens to recount his experience? We extract:

"The last cause (of emigration) which occurs to me arises from the instigation of in-

terested persons, who promote the ferment of the people, and go about recruiting for the plantations with the usual eloquence of crimps. They generally gain belief from the character they assume, their subject, and the dispositions of those whom they address. Their mountebank elocution is wonderfully popular, because suited to every capacity. Their exaggerations and fictions work like a talisman's wand, or an electric shock. The poor and illiterate portion of the community have taken it for granted that all foreign countries are different from their own, and that every traveller must have strange adventures to tell; this more readily makes them fall a prey to those whose interest it is to deceive them.

"Some instigators have lands in America, but they have no people to cultivate them; they must then try to supply this want by those measures which interest suggests, by large promises of prosperity, and by gay descriptions of the country. They run no risk of detection till they have gained their object, and then, detection is less dangerous. At any rate, they who are willing to be deceived take some time to recover their senses, and when they do recover, they are ashamed to confess their weakness, because it is humiliating.

"There is another species of instigators, whose character is more detestable than those above described; they are those who want long and lucrative leases; but the difficulty is, how to dispose of those who in consequence must be dispossessed. Proprietors, though tempted by large offers, are unwilling to drive poor innocent creatures afloat upon the mercy of the world, unless they choose to do it themselves. If they do, no proprietor is warranted, by his own authority, to detain them against their will.

"It is not difficult, however, to make these peasants the dupes of their own credulity. To this they fall a sacrifice; and when once the assent of one is gained, or one is removed, the whole is unsettled, or more easily wrought upon. The ground is cleared of small tenants, and the tacksman is profited by his success.

"I am told there is another class of prompters or instigators.

"They praise emigration from vanity, to show their superior knowledge or power of oratory. They are in no danger of interruption. They probably have tried emigration themselves without success, and finding wood

water, land and rocks, good and bad in America, as well as at home, they returned; but they must have old saws, and sage sentences, and shrewd nods, to please the rabble, who are determined to be pleased with any thing that is new.

"(If success having soired their temper, actuated by malice, or envy, or some vicious motive, they extol the advantages of America, and excite dissatisfaction, uneasiness, and turbulence. Bridled by the restraints of law, or fear of punishment, they dare not agitate seditions and commotions; they therefore wreak their rancour and spleen upon their innocent country in another way, and represent America as the land of liberty and pleasure. Those who listen to them, and are silly enough to be hoodwinked, may be said to deserve any punishment."

In the next section the author begins to calculate what number of Highlanders emigrate annually. He apprehends they amount to five thousand, which is an insignificant number. He imagines that if these five thousand had staid at home, and their childrens' children, Scotland would have been more populous than at present. The reverse is the case. Dr. Franklin, in his paper on the Increase of Mankind, and Mr. Malthus in his Essay on Population, have completely and irreversibly de-

monstrated, that men multiply every where with a rapidity proportioned to the permanent and habitual demand; and that, where the ways of maintenance are pre-occupied, a further increment does not easily take place; marriage is postponed, promiscuous and barren intercourse sets in, protracted celibacy, with all its concomitant habits, become general, and thus a voluntary accommodation of the number generated and reared to the number in habitual requisition takes place from natural causes. A cramped population always produces the habits of life usual in large cities, which habits keep down an increase that would there be inconvenient. But by exporting the super-numeraries to unsettled districts of the earth, they multiply rapidly, and create a demand among their descendants for the luxuries remembered in their mother-country, and thus furnish employment for an additional resident population there. Scotland will find new resources of domestic maintenance to result from the emigration of her sons. In our third volume (p. 310) this topic has already been discussed at sufficient length.

ART. XXXVII.—*Thoughts on the alarming State of the Circulation, and on the Means of redressing the pecuniary Grievances in Ireland.* By the Earl of LAUDERDALE. 8vo. pp. 122.

ONE of the grievances of Ireland here discussed is a want of small metallic change, in consequence of which paper representatives of minute values have been issued, called *silver-notes*. The wear and tear, and loss of these petty notes, is considerable among the poor, and is become a popular topic of complaint. The only remedy seems to be an increased coinage of pence, shillings, and half-crowns, sufficiently impure to escape melting, or exportation.

Another of the grievances here discussed is the state of the exchange. The Irish treasury draws on London at $11\frac{1}{2}$ above par; whereas the merchants, lord Lauderdale thinks (p. 92), would else draw at $16\frac{1}{2}$ above par. This interference with the natural course of things is a great grievance; commerce cannot speculate rationally or confidently where a minister has the impertinence to fancy he understands the interests of tradesmen better than they do themselves, and has the mischievous power of employing the vast capitals of the state to derange that natural course of things. To whom does it sig-

nify whether the exchange is high or low? If 100*l.* sterling is paid high in Ireland, at $116\frac{1}{2}$ *l.* the moment is favourable for the purchase of linens there; by the advance of one hundred pounds in London, one hundred and sixteen pounds worth of goods can be obtained. Of course the London merchants buy, and the Irish manufacturers are full of work. But the Irish absentee has to buy at a high rate the money he wants to expend in London, or Bath; and this same state of exchange, which benefits the most important branch of commerce, encroaches on the luxury of the non-resident land-owners and placemen. This encroachment is exactly the proper tax on absentees. But government, indifferent to the manufactures, and criminally accommodating to the placemen and noblemen of Ireland, have set about reversing this wholesome state of things; and instead of drawing in pounds sterling on London, and selling their drafts by a broker at the current rate of exchange, have drawn at the specific exchange of $111\frac{1}{4}$ *l.* Thus five per cent. is struck off the profit of the English

buyer of linens, who of course buys less or not at all; and five per cent. is added to the revenue of the non-resident Irish, by which means more persons can afford to quit the country. Thus the prosperity of vast manufacturing districts is nipped in the bud, and agriculture is retarded by offering a premium for the non-residence of proprietors. Such is the mischief of meddling politicians.

A third grievance here discussed is the excessive issue of bank-paper. The remedy is simple. Withdraw the restriction, as it is hypocritically called, on the conversion of notes into cash. The privilege conceded to the banks of England and Ireland, of not paying in specie, diminishes the value of every man's capital throughout both countries, by all the effect of the additional capital thus thrown into circulation. The bank of Ireland ought to have no other limitation imposed on its issues than would result from this simple act of justice. Private banks would perhaps discount somewhat more at six per cent. and the monopoly bank somewhat less at five per cent.; but the sum issued in discounting would not be very different. Discounting can be performed cheaper by great institutions than by individuals, whose capitals have a distinct habitual destination; but it will always be accomplished at one premium or other in the degree in which it is necessary to the wants of commerce. It is a mistake to suppose, that the issue of bank-paper can ever diminish the scarcity of money, as has already been explained (vol. iii. p. 298): it does not create a new property, it only renders a pre-existent fixed property circulable. According to lord Lauderdale (p. 101), the Irish bank-notes are at present really at a discount of ten per cent.: we do not assent to his method of calculation.

In 1796, Mr. Montagu, then chancellor of the exchequer, being called on in the house of commons to defend his conduct relative to recoining the clipped money, said, "It is better to do wrong than to do nothing." This vile deference for the wishes and claims of an agitated vulgar has found successive imitators. We have still ministers of osier, who bend to every wind of popular clamour from whatever quarter it may blow. Unequal to the effort of thinking out what is right, they leave that to the public, and endeavour to obey the average instructions of the louder advisers. This is called governing by public opinion, and has been the characteristic feature of British government these twenty years. It is in fact a sacrifice of ultimate approbation to present applause. It is the art of governing *down* to the people, and of throwing away, at every opportunity, the whole advantage of forwarder information and intellect.

Rather let us consecrate the inverse maxim: "it is better to do nothing than to do wrong:" we have more cause to be afraid of an awake than of an asleep administration. The rage for interference, regulation, and enactment, whether it respects scarcity of corn, or scarcity of money, is sure to increase the evil it professes to remedy. Repeal the impediments on circulation, the restrictions on issuing cash, the arbitration of exchange, the limitations on interest, the untransportableness of specie, deliver us, ministers, from the shackles of your predecessors, and prosperity will soon return.

Of the late publications of lord Lauderdale, this appears to us considerably the best. It is written clearly and well argued. It implies all his usual information, and displays the habitual anxiety of his patriotism.

ART. XXXVIII.—*Characteristic Anecdotes from the History of Russia, with Notes, chronological, biographical, and explanatory; forming a useful Manual of Russian History. Translated from the French of the Counsellor of State, Clausen. By B. LAMBERT. 8vo. pp. 233.*

ON the sources of Russian history we spoke with some attention in our second volume, p. 280. The author of this sketch has recurred to those sources, and has drawn from them an amusing selection of anecdotes, which are well adapted to prepare for recollection, the strange names with which they are associated.

Milton, one of the best secretaries of state known to our history, whose information and intellect chiefly dictated the

admirable diplomatic politics of the protectorate, had the merit of perceiving early the importance of cultivating a political friendship, and a commercial intercourse with Russia. In his brief history of Muscovy, he endeavoured the familiarizing of those leading facts which were best adapted to prepare the statesman and the people for adopting an interest in the transactions, and an accommodation to the manners of the Russians. Since Mi-

ton, Tooke is the most distinguished of our writers who have scattered important information concerning the history of the Russian empire.

It is well to call in the aid of the German labourers in this department of investigation. To Schloetzer, to Storch, distinct praise is due : to the one for his profoundly learned historical researches concerning the national annals ; to the other for his comprehensive and instructing account of the northern metropolis. Nor will this praise be extensive, but not less amusing, work of the state-counsellor Clausen, be without its share of popularity and circulation. By selecting the more peculiar anecdotes of the Russian princes, he plucks, as it were, the flowers of character, and preserves the beauties of history. We cannot better enable the reader to appreciate this performance than by cul-ling, in our turn, half-a-dozen anecdotes from his anthology.

"Precepts of Toleration."

"History, says the celebrated Bolingbroke, is philosophy taught by example. On tracing the annals of all nations, on looking round and reflecting upon the occurrences of every age, we may be led to believe, that so many lessons have been lost to society. The same errors, the same species of frenzy, are renewed without interruption. We find a people in the thirteenth century, who, although deprived of philosophical institutions, preached peace and toleration to their prince, while all Europe armed to embark in the crusades, and while military expeditions were undertaken in France, in the name of God, against the Albigenses, twenty thousand of whom perished, because they professed other dogmas of religion !

"Jaroslav, prince of Novogorod, demanded assistance from the inhabitants of Pleskof against the city of Riga, lately built, which he wished to attack and destroy. Having some alliance with the menaced people, they answered the prince who endeavoured to persuade them to join him :

"Thou art prudent ; thou knowest that all men are brothers ; christians and infidels, we are all of the same family. It is not necessary to make war upon those who do not participate in our creed, nor to assume to ourselves the punishment of their errors ; it is much wiser to live in peace with them. Then they will cherish our mildness and our virtues ; they will be affected by them ; and from the friendship they will conceive, will pass to the love of our religion."

"Noble Freedom appreciated by Iwan."

"Jerome Bowes was sent by Elizabeth, queen of England, in quality of minister to the Tsar of Russia. To conform to the et-

quette of the times, and the prerogatives of his place, he remained covered at the first audience. Some one represented to him the danger of such a conduct, and the evils he might bring on himself by it. "I am not unacquainted with them," said he, "but I am the ambassador of a queen who will revenge any affront offered to her in the person of her minister." The prince, far from being offended at such a declaration, presented him to the assembly, and recommended the boyars to imitate his example. "Behold," said he to them, "a brave man, who has the courage to uphold the honour of his sovereign with dignity. Who among you would do as much for me ?"

"Simplicity of Manners in the Time of Alexis."

"A Russian author relates in his Notices, a work which he compiled abroad, that during the reign of this prince, gold was as scarce as silver was common, and that consequently a large sum could not be carried without inconvenience : it was therefore the custom to pay visits without money to stake at play ; but such was the courtesy and simplicity of manners, that in the respectable houses of Moscow the masters gave the servant bags with thousands of rubles, to distribute to those who played. The company being met, each of them demanded money during the evening of the confidential man, so that, in some measure, they played at the expence of the host ; but the next morning they did not fail to return him the value of what they had taken and lost.

"These societies, continues the same writer, were free from pomp and ceremony ; every one was at his ease, and loss or gain did not dissipate the general good-humour."

"Unexpected Mediation."

"Major-General Golitsin having gained a victory as much by his valour as by his presence of mind and military knowledge, the emperor gave him permission to choose his own reward. He requested the pardon of Repnin, who had been disgraced a short time before. "How !" replied the monarch, "are you ignorant that Repnin is your mortal enemy ?" "I know it," replied Golitsin, "and that is precisely the reason why I supplicate your imperial majesty to grant him his pardon." Peter the Great then caused it to be announced to Repnin, that yielding to the earnest solicitations of Golitsin, he had restored him to his favour ; but thinking it, at the same time, his duty to give an eminent mark of his esteem for such generosity, he conferred the order of St. Andrew on the victor."

"Public Spirit of Peter I."

"After the conquest of Estonia, and the capture of the city of Revel, the emperor ordered the inclosures and fortifications of the port to be repaired, opposite to which he

erected a palace in the Italian taste, and planted a large pleasure garden. The Tzar named this charming spot the valley of Catharine (*Catherinen Thal*) in honour of his wife. He knew that neither himself nor his family could derive much advantage from it, as he was unable to remain long there; but his intention was to provide a place of recreation, where the public might meet. Some years after, when the whole was completed, he returned with the empress to Revel, and went to reside at the castle. Surprised at not seeing any person walking in the park, he asked a sentinel the reason. The sentinel said, "because no one of any description was permitted to come in." "How!" replied the emperor sharply, "what blockhead gave that order?" "Our officers." "What stupidity! did the fools imagine that I had caused these extensive walks to be made for myself!"

"Next morning it was proclaimed through the city by beat of drum, that all the inhabitants were allowed admission into *Catherinen Thal*, and that every one might go there for amusement, the guards being only stationed to prevent tumult, and to protect the trees and other objects from being injured."

"Instance of Courage and Humanity."

"A young officer of the police, who, at the setting in of the winter, was stationed on the quay at the Neva, to prevent any one from attempting the passage of the river till it was sufficiently frozen, discovered a person on the ice who had escaped the notice of the guard on the opposite side. Apprehensive of his dan-

ger, he called to him to return. The other heedless of his intreaties and his threats, kept advancing, until, suddenly, the ice gave way under his feet, and he sunk. The guard called for assistance; but perceiving that none of the spectators attempted to succour the unhappy man, he threw off his coat and plunged in, regardless of his own danger, and by his strength and courage, brought the man to the shore, who, two minutes later, must have lost his life. The emperor Alexander, who was riding, arrived on the spot at this interesting moment. He addressed the officer in the most flattering terms, and, giving him a ring from his finger, promoted him to a station greatly superior to the one he filled."

Not all the anecdotes here related are quite trustworthy: some speeches are ascribed to Peter I. which repose on a better authority than Voltaire and Leveque; and some actions are ascribed to romantic and heroic motives, which may more probably be accounted for on common principles.

This translation is not made directly from the original, but through a French medium: it misbecomes us thus to avoid the approbation of Paris before we import a foreign work: this may be ascribed to a perverse habit in our reviewers, of crying down every thing German, a practice which has much interfered with our national popularity on the continent.

ART. XXXIX.—*The Effects of Civilization on the People in European States.* By CHARLES HALL, M.D. 8vo. pp. 324.

NATURE seems to have intended man for an eternal circle of conditions. From the anarchy of savagism regular causes every where draw him to the cohesion of barbarism. In this state the bonds of religious and political discipline are drawn tighter and tighter, until at length restraint generates industry, domesticity, and the elementary qualities of civilization. During the period of wealth and refinement which succeeds, religious and political coercion relaxes, education is diffused to all, and confined to those exercises, military and civil, which are required by all. With the equality and military habits of savagism soon returns its turbulence and ferocity; warfare levels the cities, and banishes the arts of trade; a community of women supervenes, each of whom lives unmarried, and rears an offspring by various fathers; education is more and more neglected, and the seats of culture resume the rudest condition, in which any part of the old world has yet been observed.

Much of this retrogradation has occurred in France during our own times, and will probably extend alternately to the other European nations.

There are always certain minds in unison with the coming age; an indistinct foresight of what must be, glimmers upon the intelligent; some of whom invite, assist, and welcome the new order of society. Thus Rousseau, among the French, undertook a systematic apology for the savage state, which he represented as the most desirable side of the social wheel: and the great popularity of his work, *Against the Inequality of Conditions*, is a strong proof, how sensibly the French felt they were sliding back to that stage of society, whence their ancestors began to emerge under Charlemagne.

Mr. Hall has undertaken, in English, a similar apology for savagism; and has endeavoured to show, that toiling for wealth is labour in vain; that as much comfort is possessed by the savage as by

the civilized; that happiness is more equally distributed, and less precariously held in the ruder communities; and that it is high time to begin marching back to the manners and morals of the middle ages. It is improbable that his book will be popular, like that of Rousseau; because we have not yet attained the acme or summit of civilization, and are therefore not ready to listen to those who are for leading us down the hill on the other side: at the time, no doubt, will come, when the Halls and the Northmores shall be hailed as the meteorous harbingers of that aerial dawn, which, in some equinox of anarchy, is to supersede the polar summer of our prosperity, and to illumine the numbing level of equality during the wintry midnight of a new dark age.

This treatise is written with talent: of its spirit an idea may be formed by the author's own recapitulation of his argument.

"Having given, under different heads, the effects of civilization on the mass of the people in most European states; it may not be amiss to draw the most material of them more closely together, so as to bring them under one view.

"We have seen that a small number of people in these states have first got possession of the land, the stock on it, and every thing that it produces; and then, by the means of these, have obtained the command of the labour of the people.

"This comparatively small part of the people being thus in possession of those things, and the power connected with them, are naturally desirous of securing those their great advantages over the rest of the people; and to put it out of the reach of those people to recover them.

"The power they are in the possession of furnishes them with the means of securing it, as well as the wealth which is the foundation of it. To avail themselves of this power, the first step is to take the right of making laws, exclusively of the people, but which shall bind the whole people into their own hands, i. e. to assume the legislative power. This they do by means of their wealth.

"Having gained this important point, the next step was to make use of, and exercise this legislative power, by enacting such laws as would effectually secure to them the objects in view, i. e. to enact laws to secure property. The things of which the people are destitute, namely, the land and its produce, being such things as are in a high degree necessary to the comfort and very existence of the people—to enable the rich to retain these, must require strong and severe laws. This we find was done. The laws securing property in most civilized nations are of the most

severe kind; severe in the penalties and punishments inflicted; severe in their long duration; severe by their pain and torture; horrid by the terrors and agonies by which the mind of the unhappy sufferers are agitated and distracted, for many months, under their dreadful sentences.

"These few, i. e. the aristocracy, being possessed of the property of the whole people, and having power of claiming almost the whole labour of them; and having also, by the means above mentioned, secured it firmly to themselves; their next consideration is to make use of and apply this labour in such a manner as that it shall produce such things as will most gratify their desires and inclinations, and administer to their ease and pleasure. This is done by the manufactures of various kinds. These therefore are introduced, and forced on the people by all the means that artifice and power can furnish; notwithstanding the employments are such as include every thing that human nature, till by long habit it is broke to it, feels irksome, nauseous, painful: and notwithstanding they are unwholesome, debasing, and destructive of mind and body, to such employments nineteen-twentieths of the men, their wives and infants, are condemned, during all the years, months, and days of their lives; enjoying a very small part of what their labour yields. These employments, together with their poverty and want, occasion the miseries and mortality before stated.

"Most of the civilized states of Europe, not content with bringing miseries on their own people, extend their baneful influence to nations, inhabitants of the remotest parts of the earth. How many millions of the most harmless and innocent race of people to be found have been by a few avaricious traders reduced to misery and famine! How many from Africa have been brought to a worse condition than our cattle, by other sets of traders!

"The sum therefore of the effects of civilization, in most civilized states, is to enable a few of mankind to attain all possible enjoyments both of mind and body that their nature is susceptible of; but at the expence, and by depriving the bulk of mankind of the necessities and comforts of life, by which a great proportion of them is destroyed, and the remainder reduced both corporally and mentally far below the most savage and barbarous state of man. All these things being brought about in a regular, orderly, silent manner; under specious forms, with the external appearance of liberty, and even of charity; greater deprivations are submitted to by the poor, and more oppression exercised over them, by this cool, deliberate, systematic junction of art and force, than force alone was ever known to accomplish.

"This, as we have said, is the actual state of things in most civilized countries: but I by no means assert that this state was brought about by the express design or the contrivance of any set of people in these communities.

After the assumption of the land in large parcels, and the inequality of other property, which was the consequence of it, took place; it is probable that the power which followed, in those that possessed that property, over the rest of the people, was the spontaneous and almost necessary cause of the present system in most civilized states: but we are not, on that account, to be less anxious for its amendment."

There would be injustice in not giving to the author's remedy the same circulation as to his supposititious disease; for as a printed grievance may turn out an epidemic, the specific should also be within call.

"Having now stated the unhappy situation of the mass of the people in most civilized nations, and also assigned what I apprehend to be the true cause of it, it now remains to propose a remedy for it: but

Hoc opus, hic labor.

"This, however, does not arise from any difficulty in finding an appropriate remedy; for when the true cause of a disease is discovered, we are seldom at a loss for a cure. The difficulty arises from the unwillingness of those who occasion the evil, and who imagine that it is for their interest that it should continue, to permit the remedy to be applied.

"An ancient physician says, that all changes in the constitution, though even from worse to better, ought to be gradual. I believe the same caution will still be more necessary in regard to the political constitution: great disorder and even convulsions are apt to be raised in both constitutions, by a hasty and indiscreet use of powerful remedies. But it has been found by experience that the human constitution will bear, in large quantities, powerful medicines, if administered with skill and caution. The remedy I have to propose in the disease of civilized society is powerful, and a powerful one in this case seems to be required. It is not, however, a dangerous one, and may be safely committed to the hands of such persons as are disinterested and dispassionate. To obtain such persons, they should be taken not from the aggrieved party; for from that quarter they would not probably be cool and temperate; their feelings, from the pressure which they have undergone, would probably urge them on too violently. On the contrary, as neutral persons are hard to be found, they should be taken from the aggrieved, or the aggrieving party; for, though we may be inclined to do justice, we are seldom so hasty and violent in doing it to others, as we are to have it done to ourselves. Such persons might be safely entrusted with the management of the most powerful means. It would be better, therefore, that the redress of the grievances of the poor should originate from the rich themselves.

"The cause of the evil having been demonstrated to be the great inequality of

wealth, the remedy must necessarily be either to remove this inequality, or to counteract and to prevent its effects. As to the first, I would only propose the abolition of the law of primogeniture, which is to be found in most nations, and the annulling of which, in the course of no long time, would, as has been before shown, have greater effects than may be imagined. It is a practice worthy to consider it in a private view, does not conduce to the happiness of the people; a practice that makes beggars frequently of the children but one; and, if the parent has an equal affection for all of them, is scarce a less grievance to him than to the younger children. A possessor of a large estate has this case but one, perhaps, of a large family provided for; and to provide for the others in a way in any degree suitable to the manner in which he has brought them up, or would be expected from him, he is embarrassed all his life—and not one father in ten has the conduct to effect it. A law attended with these circumstances would not, as should seem, have been continued so long had there not been some reason, not avowed for it. A family with a head raised some above the rest gives a miniature of monarchy, and has from that resemblance, and for other reasons, been supposed incalculable support prerogative. Alas! how few institutions in most states have the good of the people in view, either in their origin or continuance!

"As to the other mode; namely, to prevent the effects of wealth. It has been said that the chief effect of the unequal distribution of property is the drawing off the labor of the poor from producing the necessities of life, and employing it in producing the refined manufactures. The obvious remedy, therefore, is the prohibition, by law, of the refined manufactures, or the subjecting them to such heavy taxes as would much less the production of them. The direct operation of this would be the prevention of the effects of the alleged cause: this would be drawing the venom from the jaws of the serpent, and depriving him of the power of destruction: this would prove an effectual cure, and that in a manner safe, peaceable, and constitutional; liable to occasion no disorder in the constitution; no convulsion in the state; and requires nothing to be put in execution, but a real desire in the rich of redressing the grievances of the poor. Neither is it a novel, untried method; the enacting sumptuary laws having been the practice in many states and ages. Here, then, is the cure, not Utopian; but simple in its nature, easy in practice, and certain in effect.

"The advantages of this method are obvious. In the first place, the change may be introduced by as slow degrees as shall be found requisite; so as not to throw artificers out of employ, till labour is found for them in agriculture, and the arts subservient to it; which will soon be the case, as the capital

before employed in the refined manufactures, how less in demand, will of course be transferred to agriculture, &c.

"Another circumstance that renders this mode less exceptionable is, that it will alleviate the miseries, and bring comforts to the poor, without in any proportion diminishing the gratification of the rich man. Will the poor be less warm in a second cloth than he who is in a superfine? Will he sit easier in a velvet than a plain chair? Will he sleep better in a silk than in a linen bed? Will he eat less heartily, his appetite unhurt by exotics, on plain beef and mutton, than he does on high-seasoned dishes, unnaturally provoking it? The truth is, the pleasures which the rich enjoy are by no means equal to the sufferings the poor undergo, in the present system.

"It has been observed, that in every science, the more thoroughly it is understood, the fewer and more simple are its principles and precepts: hence the remedy proposed, being single, and in its nature simple, carries presumption with it that the true cause of the evil in question has been assigned."

The mischievous effect of the privileges of primogeniture, and of the practice of entails, are sufficiently obvious, without the vast scaffolding provided by this author to exhibit them in an unwelcome point of view. The laws which distinguish between real and personal property must first be revised: and as the legacy-taxes on personal property approach nearer to the true value, than those on real property, it is for the interest of the revenue to make the change. The privilege of entail, and that of qualification to sit in parliament, may next be limited to capital vested in the public funds. Hereditary consequence should be confined to those who stake their property in the hands of their country; not to those who guard their acres with an armed peasantry against their due proportion of taxation; who pass corn-bills to indemnify themselves, at the expence of the poor, for pretended land-taxes; who profligately propose the plunder of a tenth of the funds without offering at the same time a tenth of their estates to the country; and who have attached great political and constitutional rights to a form of capital, which the financier only knows by its niggardliness.

As to the second alternative prescribed by Mr. Hall, the enactment of sumptuary laws, we cannot conceive his motive for the proposal. Expence, luxury, extravagance, profusion, these are the virtues of opulence, the grand levelling causes, which restore the expedient balance of property,

and undo the folly of governments in patronizing and promoting inequality. Enact sumptuary laws, and the accumulations of avarice, of rapacity, of monopoly, of violent plunder, will never wander back to the reservoirs whence they were pumped, but endow a pampered greatness with incessant superiority. Rather enact laws to compel the payment of gaming debts, and the contracts of minors, to permit the breach of entails, and the violation of endowments, and to promote the voluntary descent of the children of prodigality into the middle classes of society. Wealth should be the reward of industry and exertion; it should escape from idleness, from negligence, from rashness; and, with it, nobility should expire, which is a privilege too vast and too permanent for the interests of emulation and the proportion of recompense.

We recommend this book to perusal, not to confidence. It is one thing to remove the legal impediments to equality, it is another to enact artificial provisions for introducing it. The boldest inroad on huge possessions, which is likely to be executed, would be a legacy-tax on property descending directly, which should increase with the amount bequeathed, so as to levy on small properties one per cent; on larger, two; on great properties, four; on vast, eight per cent. In this way every generation of the rich would be sensibly impoverished, if the arts of acquisition fall into neglect.

A heavy and proportionate tax on the jointures and settlements of heiresses would diminish the motive for wedding debility and overlooking beauty, which endows a family with the best gift, bodily health and perfection.

Men breed down to a certain pitch of misery; to a lower in the rude than in the luxurious nations. The savage races therefore continue to multiply in a state of privation and difficulty, which would impose celibacy in a civilized community. The lowest classes of civilized life are consequently better off than the community in savage society. Whatever rises above the basest order is clear gain to human happiness: it is so much plenty and enjoyment, which in a savage state would not have existed at all. There all are equal: all are fed, as in a workhouse, with the merest necessities, and with the least possible amusement of labour. With every improvement in civilization, the suffering classes become fewer, the enjoying classes more numerous. Machines are

invented, which dismiss whole villages of the miserable, and maintain the proprietors and scatterers of their productions in comfortable affluence. Not only the intensity of human welfare is greatly increased on the whole by the social arts, but the numbers of those maintained in a given district. Where savagism will feed ten, civilization will feed a hundred. It is a preferable form of national existence, not only because nine-tenths of the community are better provided for, but because nine-tenths of the community are super-added to what would else exist.

Whether civilization is strictly the result, or the cause of the condensation of populousness, has been occasionally disputed. There seems to be a mixture of action and reaction. Multiply, from whatever cause, the people, and new divisions

of labour and arts of life are recurred to, which approximate them to a more refined condition. Thin the population, from whatever cause, and something of the idleness, privation, and rudeness of savagism will return. The North-Americans wilder, as they disperse along the Ohio and the Mississippi; and recivilize, as they collect in the Genessee country, and about the lakes. The expulsion of the Moors rebarbarized Spain; the intrusion of the French would recivilize Egypt.

The style of this work is clear and full, the argument ingenious, but sometimes excursive: there is too much about the detail of agricultural operations for a speculation which discusses other agrarian laws than those of the experienced farmer.

ART. XL.—*Observations on the Poor Laws, and on the Management of the Poor, in Great Britain, arising from a Consideration of the Returns now before Parliament.* By the Right Hon. GEORGE ROSE, M. P. 8vo. pp. 44.

THE last thirty years have produced a marked change in the condition and manners of all ranks of society in Great Britain. There has been a vast increase both of wealth and people; but there has also been a grosser and a growing inequality in the distribution of the wealth and in the comforts of the people. This is chiefly to be ascribed to the perverse legislation which has uniformly distinguished this period. Instead of breaking up, as Adam Smith proposed in 1776, the commercial monopolies and great corporations, which always favour the concentration of jobs, contracts, speculations, and profits in few hands, a corrupt preference has been shown, by our ministers and lawgivers, to the commercial aristocracy. Every thing has been done to sacrifice the numerous to the superior classes of tradesmen. The charter of the India company has been renewed: the bank has been privileged against legitimate demands: the interests of our manufactures, which maintain the poor, have been postponed to those of a colonial agriculture, where an equal circulation of capital maintains but a hundredth part of domestic industry. Taxes on popular consumption have been multiplied beyond example: imposts on the rents of houses, lands, and bonds, and on conveyances and legacies, which justice indicated as the first, were reserved for the last resources. Accordingly the higher orders of the commercial world have thriven; but the middle class has sunken

step by step, until at length it is reduced to recruit the numbers of the poor. One-eighth of the population of the country is maintained by charitable contribution.

The poor rate is now more than treble that of 1776, and more than double that of 1786. Yet, as Mr. Rose too truly observes (p. 4) "I may venture to say, that those who look most narrowly into the present situation of the poor will not think it on the whole advanced in point of comfort beyond what it was thirty years ago."

Dr. Macfarlan's Enquiries concerning the Poor were first published in 1782; they still constitute the best book we possess on the subject. They recommend, with Price and Acland, the institution of benefit-societies: they reprobate the construction of houses of industry as less expedient than domestic relief. Mr. Rose has the high merit of having introduced to parliament that bill for the encouragement of benefit-societies, which repeals the law of settlement in favour of those paupers who are members of such societies. From this pamphlet it may be presumed that he also aspires (p. 33) to accomplish the abolition of work-houses. The proper use of these edifices would be to convert them into hospitories for the aged poor: there must however be receptacles for orphans, and for abandoned persons, who are suddenly thrown on their parishes for a maintenance.

One million and forty thousand persons

In England and Wales are stated to be in the habit of receiving relief. It would be as unsafe as inhuman to turn those people loose upon the chance of voluntary bounty. What is to be done? Surely the wages of labour ought to maintain the workman. Under the present system, the employers of the poor issue less than the average value of maintenance, and, in the form of meal-money and winter allowances, assess the rest of the community to pay their workmen. Encourage the rise of the wages of labour. This will promote the introduction of machinery throughout our manufactures, and render these less likely to migrate into the cheap and populous countries. Our agriculture enjoys a monopoly of the home-market, and can therefore assess the increased wages on the price of produce. This rise of labour may best be promoted by a profuse exportation of the poor. At the first peace, let our ships of war be employed in transporting gratuitously to our several colonies all those who wish to emigrate. The number will be found very considerable of both sexes. The shattered constitutions of a metropolitan poor will best bear removal to the tropical colonies. The hardy mountaineers of Wales and Scotland are fitted to succeed in Canada. The increase of poverty is the signal of nature for dispersion.

If we compare those countries of Europe which are placed under a presbyterian hierarchy, with those which are placed under an episcopal hierarchy, it will appear evident that the instruction, and the morals of the poor, are far better attended to by the presbyterian clergy. They are a remove less above the poor than episcopalian clergymen: they habitually condescend to visit the lowest of their flock, they blush not to diffuse elementary instruction, they willingly share those toils of superintendence and accountability which refinement scorns. Hence the cheaper and superior management of the Scottish poor, which is candidly acknowledged by Mr. Rose.

"It has been much insisted upon, that in other parts of the united kingdom, there are no compulsory rates for the maintenance of the poor.

"This assertion, though very confidently made, and very generally received in England, is however, as far as regards Scotland at least, altogether erroneous. For I am informed, from an authority on which I can confidently rely, that the poor there are supported by collections at the church doors; by certain small fees on marriages, baptisms, and

funerals; and by the interest of sums given or bequeathed for that purpose; and, when the above are not sufficient, by an assessment laid on the parish by authority of the heritors or landholders; and the kirk-session, that is the minister and elders of the parish. The amount of this assessment, upon the whole, is (as in fact it is in England) in proportion to the actual number of poor in the parish at the time. The selection of objects to whose relief this assessment is to be applied, is likewise vested in the kirk-session, whose ordinary functions in this respect may, if there is any reason to suspect abuse, be controlled by a meeting of the heritors. In England, the selection is in the first instance in the overseers, but checked by the vestries, consisting of the inhabitants who pay the rates, with an appeal to magistrates. The imposition therefore and appropriation of this tax, in both parts of Great Britain, being lodged in the hands of the very persons who are to pay it, should give the fairest chance for such imposition and appropriation being limited by the necessity of the case. But the chief distinction between England and Scotland with regard to the poor, arises from the superior management in the latter; where they are as effectually provided for as in the former, though at infinitely less expence; and in some degree at least to early education. There are few workhouses in Scotland, (none except in a few great towns) nor is it usual to send any persons there who can find places of residence for themselves; infinite advantage is likewise derived from the constant and active attention of the clergy, who are invariably resident, and who have no interest to balance against their feelings of humanity. Another essential difference in the management of the poor in the two countries is, that in Scotland there is no power, or at least none that is commonly exercised, of removing paupers from the parish in which they have not acquired a settlement by residence, to the parish where their right of settlement is. The just apportionment of this burden between the parishes may be, though it very seldom is, I understand, a matter of legal discussion; but it does not affect the personal freedom of the pauper, who may reside where he pleases. When disputes arise concerning the settlement of particular paupers, which are not often carried to the extremity of legal proceedings, if the parish where he is resident at the time prevails, the parish found liable might perhaps insist on his coming to reside there; but in practice, I am assured, the managers of the funds for relief of the poor in such parish always prefer paying a compensation to the parish where he resides, from the expence of which the law has relieved it; which saves to themselves, or to the public, the charges of removing him; and if he is able to do a little work in aid of the public fund, it leaves him undisturbed in the exercise of such industry or occupation.

"From the short account here given of the

Scottish laws and practice relative to the support and employment of the poor, it will be seen that, contrary to the supposition, too hastily adopted, of our English writers on the subject, the general principles of the system very nearly resemble those of England; the diligence seems, as before observed, to be in the execution of the powers, which the legislature has provided for attaining its object."

It is rumoured that government was projecting to take the management of the poor into its own hands: we hope that this scheme is not to find warm patrons among the newly-constituted authorities. The rage for governing too much must surely by this time have spent itself, and must begin to look back with melancholy regret on its labour in vain and its toilsome injuries. Elective institutions alone retain their vigour unimpaired: unless the

people appoint the overseers of the poor, there will soon be oversight. It is the elective character of a presbyterian hierarchy which is the cause of its efficacy: were government to appoint by its exclusive will the presbyterian ministers, they would become, as in other establishments, indolent courtiers.

The slow progress of instruction in England is deeply to be lamented. Macfarlan wrote in 1782: yet how many workhouse-bills have been passed since that period: our philosophers think in vain; we are determined to learn only from our own experience.

This pamphlet contains many curious facts, drawn from the reports laid before the house of commons, which are nowhere else so cheaply accessible.

ART. XLI.—*An Essay on the Principle and Origin of Sovereign Power. By a Dignitary of the Church. Translated from the French, with a Preface and Appendix. 8vo. pp. 350.*

THE restoration of absolute monarchy in France operates, as might be expected, on the literature of the country. The cringelings of despotism are looking back to the ancient apologists of arbitrary power, and are republishing the obsolete sophisms of their jesuitic predecessors, in order to stabilitate the practical omnipotence of their emperor by a corresponding theory. Certainly these principles are never so plausible as when urged in behalf of a great sovereign; and never so contagious as when the natural schools of refutation are reduced to the fewest possible number. England and Sweden are the only fragments of the old world which retain a trace of limited government. "It is at no time easy to spread among the people a passion for liberty; that requires principle, self-denial, exertion, disinterest, instruction, humanity, patience, perseverance, justice. But in all evils of the opposite kind the natural inclinations are flattered: to obey accommodates the indolence; to corrupt and be corrupted, the avarice and ambition of men. We are now once more, as were our ancestors, in danger of being entangled by the example of France, in the net of an hypocritical and relentless despotism."

With such feelings, we have already stated them in greater detail (Vol. II. p. 335 to 337), we cannot approve the needless importation of French principles in politics: they are often enounced with

eloquence, and illustrated with felicity; and when they profess to borrow, as in the present instance, the aid of religious doctrines common to both nations, they are but too likely to find, even among respectable persons, a listening and a docile audience.

The first part of this work undertakes a refutation of the hypothesis (so this author calls it) of a state of nature anterior to society.

It is an historical fact, that savages pass many ages in anarchy before they unite under any form of government: while the means of maintenance are easy, while the hunters can find game, and the graziers pasture, this anarchy mostly continues peaceful: it degenerates into hostility when the scramble for food begins. The necessity of concert, for the conduct of efficient hostility, has every where founded the first, rude, occasional, transient government, the elective monarchy of military chiefs. Not theory, but observation, contemplates a state of nature as a state of war.

"Hobbes asserts (continues our author), that the condition of man, in a state of nature, supposes perpetual warfare, because all have a right to all things, since each man endeavours to establish this right in his own individual favour, and claims it as an indisputable privilege. Hobbes subjoins, that man, from the necessity of his nature, is inclined to relinquish this state of misery, in which he cannot comply with the laws of nature; and he

draw this conclusion; that fear induces him to enter into society.

"What is, then, this alleged necessity in the nature of man, which forces him to quit the state of nature? and still farther, what is the state of nature, in which the laws of nature herself have no efficacy? all this appears, say, not only contradictory, but absurd. The French jacobins have reasoned much after. In the midst of anarchy, they have promulgated revolutionary laws. These are, say, the natural laws of anarchy.

The object which Hobbes proposes, is to discover the origin and principle of sovereign authority. Natural laws not operating, says the philosopher, in the state of nature, the fundamental law is, the maintenance of peace. Man cannot accomplish but by delegating his right to a representative body, to a state, or a single person, invested with the sovereign authority. From the moment he does, yields up his rights, the sovereign alone exercises all which man possessed in the state of nature. No authority whatever, can be independent of his. He is the arbiter of right and wrong, and the only competent judge to decide on all religious and political opinions which arise in the state. No recourse can be had, and no reference can be made to any foreign, or other tribunal, not even in matters of religion; because such appeal would produce a rivalry of power, and endanger the maintenance of peace. Since this state of peace is the fundamental law from which all others flow, it would be repugnant to the natural law, that there should subsist in the same society, two authorities independent of each other.

"Hobbes is not aware that the peace enjoyed under the sanction of the laws of society, is necessary for the observance of natural laws, of which it is not the source: as natural, existed, prior to human laws. To suppose that mankind are, originally, in a state of warfare, and that the state of peace obtained by instituting government, is the foundation of natural laws, is, as Montesquieu justly remarks, 'to make virtue and vice depend on laws formed by men, and to subvert, with Spinoza, all religion and all morality.'

"Man is born with evil inclinations which render him hostile to his kind. This is the true position of the case. But, at the same time, he is born in society, and subject to an authority that restrains his passions, and affords to reason time to resume her sway. These are two facts which must not be separated, as Hobbes has actually done, to support his theory. He first produces man existing in a state of war, and then, to secure the state of peace, he makes him stipulate with his fellow-creatures, and agree to form society.

"If the system of Hobbes is radically absurd, it is not because he asserts that men are born naturally hostile to each other; it is be-

cause he supposes that this state of anarchical nature is anterior to the formation of society. When we observe the will of man subjugated by his vicious inclinations, we endeavour to trace the cause of a disorder which is by no means natural, and we discover that in the beginning, he has not passed from a state of anarchy, to a state of society; but from a perfect society, where by means of his innocence, he held communication with his Maker, with celestial beings, with a company analogous to himself, to a state of degradation in which his evil passions would have almost totally extinguished the light of reason, if for the happiness of society to which he has been preserved, God had not added the farther benefit of the authority which regulates it, and which it cannot dispense with; at any period of its formation, or existence."

The argument of Hobbes is here not unfairly stated: but where is the pretended refutation? Hobbes says that man relinquishes the state of anarchy by that necessity of his nature which inclines him to avoid misery. Is this contradictory, or absurd? But the author, having warped the word jacobins into his first paragraph of reply, thinks, like a true follower of Burke and Barruel, that he has won a victory.

The second attempt at answer is given in the language and under the shelter of Montesquieu. But Montesquieu is himself not correct in asserting that Hobbes makes virtue and vice to depend wholly on laws formed by men. Hobbes recognizes, with Ulpian, a rule of right inherent in animal nature. Let us turn to the treatise of commonwealth: the twenty-sixth chapter contains the theory of civil laws: the doctrine there maintained is thus expressed. 'A law that obliges all the subjects without exception, and is not written, nor otherwise published in such places as they may take notice thereof, is a law of nature. For whatsoever men are to take knowledge of for law, not upon other men's words, but every one from his own reason, must be such as is agreeable to the reason of all men; which no law can be, but the law of nature. The laws of nature therefore need not any publishing, nor proclamation, as being contained in this one sentence approved by all the world: *Do not that to another, which thou thinkest unreasonable to be done by another to thyself.*'

This is founding equity on the interests of all, and recognizing a principle independent of accidental enactment: so that neither Montesquieu, nor his copier, can

justify their abusive assertion : and neither of them have offered any argument of objection.

The third attempt at reply is strangely vague. It begins by saying, that man is born with *evil* inclinations, which render him hostile to his kind. To say nothing of the impiety of an hypothesis, which supposes the creation of evil beings ; there is no foundation in experience for supposing that the selfish inclinations, with which a man is born, operate, in the majority of instances, inimically toward other men ; the reverse is notorious : and, with every progress in the social art, the selfish qualities of each are rendered more and more conducive to the welfare of all. To be born in society makes no difference in the original propensity ; but tends to restrain those forms of gratification, which interfere with the interests of others. It is incorrect to say that Hobbes separates these facts, in order to support a theory ; and makes man stipulate with his fellow-creatures, and agree to form society : as our author pretends, by whom Hobbes is here unfairly described as founding the rights of law exclusively on compact. Hobbes differs from other publicists precisely in this, that he considers (c. xvii.) sovereignty by *acquisition* (under which denomination he comprehends violent conquest) as *equally* legitimate and just with sovereignty by *institution* (under which denomination he classes all voluntarily formed government, all association by compact) ; but Locke and Rousseau consider only the latter as tolerable.

To attack this part of the theory of Hobbes was in the advocate of Bonaparte gross imprudence ; but the fact is, he had never read Hobbes at all ; he quotes him at second-hand, and having called him radically absurd, he exhibits, like Caracalla, his British cockle-shells, and claims a triumph as for the conquest of a province.

It is in truth presumption for such a puny arguer to break a spear with Hobbes. Does he know with whom he entered the lists ? With the greatest metaphysician of that country, whose school of metaphysical writers ranks higher than any rival school, ancient or modern. With him, who supplied to Locke the whole mass of truths in ideology, which occasionally adorn the essay on human understanding. With him, who had cautioned the world against those sophisms of Berkeley, that may be considered as a reduction to absurdity of the system of

Locke. With him, whom Hartley could only expand, and Hume only embellish.

Yet his services to the metaphysics ideology fall short of those rendered the metaphysics of jurisprudence. He in this line the rival, perhaps the surpasser of Grotius. His reading, if less comprehensive, is more select and as profound. His illustrations, if few, are far-fetched and fortunate. If he neglects the praise copiousness and maxim-quoting, he atones that of condensation and apposition. His principles, if built less on authority and testimony, repose more on observation and experience ; and, after the competition of a century and half, are requiring among publicists, a legislative rank. His reasoning is of a bolder, clearer, more exhaustive, and more unprejudiced cast than that of Grotius ; and breaks untried ground with the fearlessness of conscious right. Grotius coasts along the known shore, dropping the plumb watching the land-marks : Hobbes starts forth into the ocean, aware of his bearings and confident in his compass.

After quitting Hobbes our author proceeds in like manner to attack Montesquieu and Rousseau : respecting the men we contentedly abandon his preference, to continental estimation or contempt. The appeal to revelation, what revelation has not spoken about is perpetual. The duty of obeying Bonaparte is weakly hinged on prescriptive right. When does prescription begin ? When was it first just to obey Bonaparte ? The principles of the philosopher of Malmesbury alone supply a precise answer : they are every where hostile to anarchy, and friendly to order and to justice.

“ Subjects who revolt against the lawful authority which their fathers have taught them to respect, are guilty of a crime unjustifiable on any grounds whatever. Subjects who acquiesce in usurpation, at the same time that they hold it in abhorrence, become its accomplices and abettors, by their weakness. But the injustice is not equally applicable to the succeeding generations. The son of a rebellious subject is, in infancy and youth, completely subject to the parental authority, and on entering into life, he is, from the habits of education, submissive to the sovereign reigning. As his reason unfolds only gradually, his mind readily receives every impression stamped on it by his tutors. His parents, unquestionably, abuse their authority, and violate the engagements they entered into to direct his affections towards the

that sovereign, when they teach him to be-
lieve that the usurper on the throne, is the
legitimate prince. The heinous crime of de-
throning, thus, resting with the parents, it fol-
lows that the child, necessarily, must regard
the usurper, as the legal king, as he cannot
produce such effect. The parents impose on
their sons, without depraving the minds
of their sons, by arming their prejudices
against the government they themselves have
ruined. The unjust sentiments which
are crime and immorality in the parents,
in the children, but prejudice of education.
They are not incompatible with principles of
reason and justice. Thus, as generations
succeed each other, the ties that attach the
people to the new government, become more
sacred, and consequently, more lawful. All
the authors and victims of the revolution have
appeared; and the people have lost their
old habits, and those of former times, and
contracted new ones favourable to ex-
isting circumstances. Their affections direct
themselves, by a natural bias, towards the
ruler under whose protection they have been
living, and which, by the influence of its laws,
has them a new political existence. This
leads to subordination and justice, operating
the regular and successive action of the
moral and physical causes, that govern the
world, becomes really the order established
by the Almighty; and this is what we would
like to be understood, in saying, that a go-
vernment legalizes itself by prescription."

Many long notes are attached to this
work, some of which, as the note J. con-
tains much theological matter: they
chiefly contain historical anecdotes and
authoritative quotations, and are more a-

musings than the barren speculations of the
text; but are in places inconsistent with it.

The translator has not performed his
task with sufficient knowledge: thus at
page 296 mention is made of Rousseau in
these terms. 'His moral romance, called
Emilia, was condemned in 1762 by the
French parliament.' Here the book on
education, called Emilius, is plainly in-
tended; but the translator had never heard
of this most popular and celebrated book,
and therefore turns the hero into a he-
roine. So again in the preface we read of
Marbly, where Mably is meant; but this
may be an error of the press.

The preface is so long as to form a pro-
minent part of the book: it reviles Bona-
parte with that low virulence which the
late ministries condescended to patronize;
and constitutes an odd introduction for a
systematic homage to his authority. The
translator tells us his author, a grand vic-
ar, has for ever laid to sleep the doctrine
of the majesty of the people: is he ig-
norant that the word majesty signifies
greatness; that it is employed with more
propriety of a people, than of an indivi-
dual; that it was currently applied at
Rome to the people before it was usurped
by the emperors; and that Louis XI. was
the first modern sovereign who was ad-
dressed as his majesty? To talk of the
majesty of the people of San Marino
would be misplaced flattery; but it is a
truism to talk of the majesty of the peo-
ple of Great Britain.

XLII.—*European Commerce; shewing new and secure Channels of Trade with the
Continent of Europe: with a general View of the Trade, Navigation, &c. of Great Bri-
tain and Ireland.* By J. JERSON ODDY, Esq. 4to. pp. 651.

THE most dangerous theoretical error
which prevails with respect to commerce
is this: that a country should endeavour
to sell more than it buys in any other given
country. On the contrary, withersoever
we send goods, it is important thence to
acquire articles of importation. Else the
ships incur a loss of back-freight: and
the exchange between the two countries
tends to a par which is continually oppos-
ing fresh obstacles to our supplying that
market any longer. When the demand
at Petersburg for bills on London tran-
scends the natural supply of the Russian
exporters who have to draw on London,
the bills rise in value, and thus an addi-
tional price must be given in Russia for
all imports, which impedes the progress
of importation. Exportation and impor-
tation are alike profitable. The nearer
they approach equality, the stronger their
tendency to continual increase. A ba-

lance, an equipoise, of trade, is every
where desirable; not the preponderance
of exportation over importation.

The utility of enquiring into the pro-
ductions of different countries is in nothing
more sensible than in the great increase of
commercial intercourse, which usually re-
sults from such enquiry. If we can but
find something to consume, no matter
what, were it a mischievous superfluity,
such as tobacco, we thereby make it the
interest of the people to consume some-
thing of ours in return. The interchange
of the commodities is a profit to both par-
ties; and new means of maintenance are
opened to those who employ themselves
in the transportation of goods. The mo-
vers of wares, sailors, watermen, carriers,
form a most numerous body of men, and
are in rude countries the apostles of civi-
lization, and the teachers and introducers
of new arts. To fetch and carry, be it

but a fir-tree, or a block of stone, becomes a cause of roads, and thence of agriculture; of machinery, and thence of manufacture; of reckoning and intercourse, and thence of letters, figures, languages, and learning. We may blame the child that cried for the moon: but to covet the remote is to scatter benefits at a distance.

Adam Smith defends the opinion that commerce with contiguous countries is most advantageous. The returns, he says, are quicker: and thus an equal capital can put more industry in motion. We doubt the truth of this proposition. The manufacturer sells at the shortest credit, not in the nearest but in the richest country. Where capital is of least value, it is most frequently employed in discounting. Holland and Germany bought at a shorter credit than France: so did Spain. The returns are quickest, where there is most wealth. Not the contiguity, but the opulence of a country determines the rapidity of its returns. But quick returns at a small profit are less advantageous to the trader, than slow returns at a large profit. It is better to return a given capital once a year at twenty per cent. profit, than four times a year at five per cent. profit: three-fourths of the labour of inspection and direction are economized in the slow return. Capital can be coined according to the wants of the trading world: it is not for want of capital, but of demand, that certain branches of industry droop and wither.

We may therefore modify the doctrine of Adam Smith, and lay it down as a maxim, that commerce is most desirable in those countries, where a given capital is returned in a given time with the largest profit. Now this is always the case in the rudest countries. Where the arts of commerce have long prevailed, where the competition of dealers is great, where the number of persons skilled in the objects of interchange is become considerable, the profits lessen. No advantage can there be taken. Every thing has its known value, its fixed price, its habitual quality, its expected time of payment. Commerce is become a machine, which provides every thing, of the same known shape, size, and tale. The exclusion, therefore, which this country is suffering from the tracked and trite markets of the world, is not to be classed among the misfortunes of its commerce. Others will be explored of a more profitable nature: nor would the heavy burdens of taxation, under which our commerce labours, permit us to com-

pete with our ancient advantages in the countries where profits are low. Of these new markets, Russia is one of the most promising; and the volume before us expands in full magnitude its availability.

Mr. Oddy seems to imagine that this constitutes not only a prominent feature, but a prominent merit of literary composition. His information is various and curious; but it is not select. Antiquarian anecdotes of the Anseatic cities might as well have reposed in Anderson's history of commerce, without being repeated here. A few custom-house tariffs and tables of imports and exports were desirable, and would have been instructive; but, whether three or four contiguous sea-ports present similar catalogues, some might have been suppressed. The weights, the measures, the moneys of exchange, are not only to be found in every merchant's assistant or negotiator's magazine; but are here faithfully chronicled, as if they were recorded for the first time. The gazettes are put in contribution, and lists of minute places are given in alphabetic order; but the road-books are unaccountably forgotten: in several places we wished to vain for information concerning the relative distances. Mr. Oddy has made his book as he would have made an invoice, every petty article, which it is justifiable to charge for, is pressed into the list of particulars: the object is to swell the sum total of value. Booksellers now-a-days like this: they will not touch a pamphlet, or an octavo, because it does not pay the advertising: but a huge bale of quartos is a speculation worth opening an account for.

An interesting map of Europe is prefixed to this volume, in which the national boundaries are omitted, but the rivers and canals are all traced, by which means the main courses of produce are visible at a glance, and the natural commercial metropolises present themselves. It appears that Riga is a more adapted emporium for Russian trade than Petersburg; and, as it is more accessible from not being frozen up so soon or so long, it will probably become eventually of more consequence than Petersburg. The very expensive quays and custom-houses made at Petersburg form a motive with the government to force intercourse into that direction: so again at Odessa, which is a still more perverse situation, government having there constructed showy buildings will have them made use of. This is a consideration beneath the enlightened mind of

Alexander. If trade naturally tends to Riga and Oczakow, he would do better to transfer thither at once his patronage, and let the merit of creating a prosperity, which will strike root there, even in despite of his neglect. A valuable account given of the internal communications of Asia, of which we shall borrow a fragment:

* The Wolga has already been described, together with its junction with the Neva, connecting the Baltic and Caspian seas, and so the route to Siberia and China, all of which are united by means of the canal of Peter Volotshok, through which the principal part of the trade of the empire is conveyed.

"The number of barges which passed through the canal in 1776, amounted to 2,537; in 1777, to 2,641; and the average number is generally computed at about 2,550.

"Many of those vessels or barks, (as they are called) bring down from 100 to 400 tons each, and some less more, particularly to Archangel. These barks are perfectly flat-bottomed, and many of a great length: the largest planks are selected for the purpose of building them; the timbers and crooks are generally selected from such trees as have roots of a proper shape. The depth of one of these vessels is seldom more than four feet; some few more: the sides are perpendicular, and not much regard had to shape: they load them to draw from twenty to thirty inches of water, or more; according to the season of the year and to the water they expect to find in their respective navigations. Their rudder is a long tree, like an oar. In case of leakage, instead of a pump, they put up a rough cross bar, from which is slung, by means of a rope, a wooden scoop, with which they throw out the water. These vessels are rudely constructed, purposely for conveying only one cargo; they cost from one hundred to three hundred rubles each; and when they arrive at Archangel, Petersburg, or Riga, and their cargoes are discharged, they are sold or broken up for fire-wood or other purposes, seldom fetching more than from twenty to fifty rubles.

"Although a great part of the products are brought down by water, while the navigation continues open, yet the great preparation for the following year's business is during the previous winter; and great quantities of goods are conveyed by sledge-ways, during this season, not only to Archangel, Petersburg, and Riga, but particularly to those parts which have not the advantage of interior water conveyance. Flax and hemp come to Narva, grain to Revel, flax and grain to Riga, particularly if the prices happen to be high at the time. The produce from all parts of the interior, which have not the advantage of water conveyance, is carried by sledge-ways to the nearest pristan, or place where the barks are built, from whence they are floated down with the current, so soon as the snow and ice

begin to melt: they are previously loaded, to be in readiness to take advantage of the water when it is high. The masts and heavy timber are conveyed out of the forests to the nearest navigable communication, during the winter; when it is that a great interior commerce prevails, particularly in the articles of importation by the last arrived ships, their cargoes being carried by the sledge-roads to the remotest parts of the empire. So general is this sort of communication, that, to and from Mosco, merchandize has been conveyed that distance frequently so low as ten copecks per pood, the ordinary rate being from twenty to thirty-five copecks per pood, which is fifteen shillings the lowest, the highest forty-five shillings per ton, for a distance of between four and five hundred miles; certainly considerably cheaper than freights by sea, for the same distance, without reckoning the insurance, and uncertain conveyance, while the other is certain and expeditious. The cheap rate of land carriage, and still more reasonable rate by water, though more tedious, is a favourable circumstance to forward the external commerce of this empire, as well as that amongst the interior provinces with each other, which is very considerable."

Nor will a short account of the Russian college of commerce be unwelcome to our readers: we have boards of trade, but they realize Adam Smith's idea of a perfect commercial government, and let things alone.

"It is no doubt of importance to every government wishing to promote any particular object, or carry into execution more effectually any particular view, to establish purposely a board, under its immediate protection and sanction (distinct from other establishments), that more minute attention may be given, and more prompt measures adopted.

"On this principle the Russian government have, at Petersburg, established a college of commerce, or, properly speaking, a board of trade, consisting of a certain number of directors, with a president, who take into consideration, and under their direction, every thing relating to the trade of the empire; and to that board applications must at all times be directed. It has the controul of the brokers, brokers, and every department connected with commerce; in matters of dispute, it acts, likewise, in a judicial capacity; and the only appeal from its decision, in case of the dissatisfaction of either party, is to the senate, where two hundred rubles must be deposited: a certificate being produced from the secretary of the senate, that the deposit is made, when the requisite documents are given from the college of commerce, and proceedings commence in the superior court.

"It is through this college, that the English only have the privilege, specially provided for by treaty, to appeal in cases of dispute, or for redress from the Russian subject; and through this channel only it is, that the native subject must apply for redress against

the British merchants; amongst whom, if any disputes or controversies arise, the directors of the college of commerce very wisely order it for arbitration among the British merchants, who are selected for that purpose.

"This is a sort of court of equity in commercial matters,—the decisions are prompt and attended with little expence, as the impartiality of the judges is at least equal to what could be found in the common courts of law: it is attended with advantage. Here it may not be improper to observe, that it is certainly of advantage in commercial matters, that differences should be decided speedily, not only because witnesses are generally ready, and the facts recent, and well remembered, but that it prevents the interruption and suspension of business, which would otherwise be occasioned. Inferior and prompt courts of this sort may be always corrected by the power of appeal, therefore they deserve approbation."

We know not why Mr. Oddy should have preferred to spell *bracker* instead of *broker*, which is our usual form of writing the word. If commerce is thus to naturalize all the synonyms of her native terms, and to incorporate them in the *lingua Franca* of the counting-house, sir Herbert Croft will not be able to confine his supplement for Johnson's dictionary to the reduplication which he has already announced. The progress toward a universal language will be very rapid, when all the words of the earth are acknowledged to be English: but an Englishman will then find it as difficult to learn to speak, as a Chinese to learn to write.

The Holstein canal deserves notice, praise, encouragement: from this description it does not appear that the Sound duties are levied on ships adopting this course.

"The Holstein canal was begun in the year 1777, and was completely finished on the 4th of May, 1785, but opened in 1784. The whole undertaking cost 2,512,432 rix-dollars. There are six sluices, which cost 70,000 rixdollars each.

"This canal on the side of the Baltic commences about three English miles north of Kiel, at a place called Holtenau, where is a sluice, another at Knoop, and a third at Rathmandorff, till it comes to the Flemhude lake, which is the highest point; and from this lake, on the side of Rendsburgh, there are three other sluices, one, at Konigsforde, another at Kluvensiek, and the last at Rendsburgh; these are on what is called the Upper Eyder, and the Lower Eyder is from Rendsburgh to its mouth, running by Tonningen, below which place it falls into the sea, betwixt Eyderstadt and Dithmarschen. The distance is about one hundred English miles, and vessels must either sail or tide it, or both;

whilst from Rendsburgh to Holtenau, near at the mouth of Kiel Bay, upon the Baltic, is only about twenty-five English miles, which can be navigated in all weathers, except during a strong frost, as horses can be had, required, at fixed rates. The vessels are sent through a sluice in little more than eight or ten minutes each, for each of which they pay only four shillings Danish, or about 10 pence English.

"The surface breadth of this canal is one hundred feet, and at the bottom fifty-four Danish measure, and the depth ten feet throughout at the least. Vessels can pass through the sluices one hundred feet length, twenty-six feet in breadth, and a feet four inches draught of water, Danish measure; and which, for the regulation of British merchant and ship-owner, as well as the master, it must be observed, is in proportion of English measure for the vessels:

Length . . .	95 feet, 4 inches,
Breadth . . .	24 — 9
Depth . . .	9 —

"As this canal may in the present state of Europe be greatly frequented, more general and minute particulars are given for the information and use of those who may avail it, and which here follow:

"All ships, to whatever nation they may belong, are allowed to pass through on the same conditions, without any exception.

"No unloading or discharging of any foreign goods and merchandize is permitted at any other place situated on this canal, than at Holtenau and Rendsburgh; but only inland produce, manufactures, and timber, are allowed to be taken in and unloaded at the sluice at Knoop, Grös Konigsforde, and Kluvensiek, and likewise by the bridges at Sucksdorf and Landwehr, and by the Tilekiln at Rade, under the inspection of the officers of customs.

"The masters of all ships and vessels coming out of the Baltic, are to give an immediate notice of their arrival at the custom-house at Holtenau, and to declare their place of destination.

"As soon as a ship or vessel enters the canal, then the master of the same is to make a general statement in the following form:

"I, N. N. master of the ship [brig, bark] called —, bound from — to —, with a cargo of —, [or with ballast] do hereby mention the arrival of the same at the royal custom-house at Holtenau, the

'N. N.'

"The custom-house officer at Holtenau then furnishes the master with a passport, according to the statement made; with which he may continue his voyage to Rendsburgh.

"In case the cargo of a vessel arriving at Holtenau is either discharged in the whole, or in part, then the statement, examination, and payment of duties of such part of the cargo, is to be made according to the royal

prescription, dated the 23d of November, 1778; if not, an exception is made with respect to those transit goods and merchandize which are landed and stored here.

* The duties to be paid on inland produce, manufactures, and goods, loaded within the limits of the canal, and not passing the limits of the Rendsburgh custom-house, are to be paid at Holtzenau, when passing that place.

* The masters of ships and vessels, proceeding from Rendsburgh to Holtzenau, are to make an immediate declaration on their arrival to the custom-house officer at that place, who will then, without any further examination, allow them to continue their voyage, on producing the passport they have received from the custom-house at Rendsburgh; no further statement in writing of the cargo they carry in, will be necessary to be made, as the duties on those ships and merchandize passing through the canal by Rendsburgh have already been paid at the custom-house there.

* In case there should be any goods and merchandize on board of a vessel coming from Rendsburgh, which are to be unloaded at Holtzenau, then the note received from the custom-house at Rendsburgh is to be delivered to that at Holtzenau. The said goods and merchandize may then be discharged and delivered according to the prescription of the act of November, 1778, and the custom-house officer will make out a particular passport for the remainder of the cargo. The same is done for those vessels coming from Rendsburgh to Holtzenau, in order to complete their cargo, with which they are to proceed to other inland places.

* Vessels which only take in ballast at Holtzenau are exempted from making any statement in writing.

* All ships and vessels arriving at Rendsburgh are to deliver as soon as they arrive there, the passports they have received from the custom-house either at Holtzenau or Tonningen to the custom-house at Rendsburgh, where the duties are to be paid on all goods and merchandize passing through the canal.

* The masters of vessels which have taken in their cargoes at any foreign ports, must necessarily be provided with bills of lading and invoices drawn up in a due and regular form, containing the quantity, quality, and value of the goods; which documents, the masters of such vessels are instantly to deliver up to the custom-house, in order to be signed: it is therefore necessary that such documents should be drawn up in as complete and plain a manner as possible, in order to prevent delay, which will otherwise take place. Those ships or vessels which have taken in their cargoes at any Danish port, may be exempted from making up a specified statement of the same, on the master's delivering to the custom-house at Rendsburgh a passport in which the goods and merchandize he has on board of his ship are duly and plainly stated.

* The masters of such ships and vessels as have taken in their cargoes in any foreign port,

and are proceeding therewith to any foreign port, are allowed a premium of four per cent. to be deducted from the amount of the duties they are to pay, which is immediately deducted in the account of the canal duties.

* After the duties and other expences taking place in passing through the canal have been duly paid, a passport is granted to the masters of the vessels for the further continuation of the voyage.

* Although the master of a vessel may have a cargo on board, which he is to discharge at Rendsburgh, in order to remain within the territories of his Danish majesty; or if even he takes in native produce and manufactures in return, yet he is to pay the duties laid upon such foreign or native goods and merchandize, in the act of the 23d of May, 1778.

* The custom-house officers at Tonningen are to proceed in the dispatch of ships and vessels sailing out of the canal, or entering into the same, according to the prescription of those at Holtzenau. Those ships and vessels arriving from Rendsburgh at Holtzenau, without having passed through the canal, or likewise those proceeding from the Elbe river and the North Sea to Rendsburgh, are to prepare themselves with respect to the payment of duties according to the act of the 23d of May, 1778.

* Those regulations are general, and there are no exceptions.

* Payment of lastage in passing through the canal, is not demanded from vessels under the following circumstances:

1. "Those passing through without loading or discharging any goods or merchandize in any part of the canal.
2. "Those small vessels which only trade in the canal, or on the Lower Eyder, from one place to another.
3. "Those ships which do not load or discharge in any place on the banks of the canal, above the fourth part of their burthen.
4. "Those ships which, on account of damage or a leak, received during the voyage, are obliged to discharge the cargo.
5. "The packet boats regularly sailing between Kiel and Copenhagen, if they load or discharge in the canal."

This author is somewhat timid and courtly, in his commentaries. He has occasion to mention the blockade of the Elbe and of the Weser, so ridiculously undertaken in our own wrong; and he mentions it without a word of censure. It obliged English goods to take a circuitous course, which greatly increased their expence to the consumer, and did not the least injury to the enemy. On the whole this work is replete with fact; and gives the newest and most authentic information concerning the state of commerce, in countries where its state has greatly altered of late years; so that it may be con-

dered as the only account extant which approaches authenticity. With the superfluity of detail we are dissatisfied: one forgets the leading facts amid the multiplicity of particulars: one is annoyed, as by a druggist's labels, with lists of what is sold but once in a twelvemonth.

Some theoretical passages occur toward the conclusion of this valuable collection of phenomena, from which the author appears to think it of great consequence that we should grow at home every thing we want. He complains that we do not rear, but import from Spain, the fine curled clothier's wool; that we send to Sweden for pitch and tar, instead of planting the highlands of Scotland; that we import corn, hemp, and various other commodities not incapable of being produced at home. We recommend to the author an attentive perusal of those chapters of the fourth book of Adam Smith which relate to the choice of a market. He has fully and irreversibly proved that it is for the interest of a community, as well as of an individual, to buy where it can buy cheapest, without any attention to the patria of the produce. If corn can be fetched cheaper from Odessa, than it can be grown

in Norfolk, it ought thence to be brought, and so with clothier's wool, with pitch, and with hemp. To purchase of foreigners facilitates sale to foreigners: and by buying naval stores in Russia, instead of producing them, we enable the Russians to buy our manufactures, and thus put into circulation between the two countries a capital which would else lie dormant, we have done better for ourselves than if we had grown at home these stores. The greatest possible circulation is the ultimate end of the wisest commercial lawgiver: this end is best promoted by not growing at home the raw productions of barbaric half-taught industry. The true art of increasing the commerce of Great Britain is to seek for distant wants. Can the produce of the butter-trees of Africa not be rendered a necessary at our breakfasts? Can the candleberry-myrtle not be allowed to furnish a cheaper and more beautiful sort of tapers than those now burnt on our card-tables? But for the duties on exports and imports, a thousand experiments on foreign production would be made, which would gradually expand the gratifications of luxury and the dominions of commerce.

ART. XLIII.—*The Conveniences, Principles and Method of keeping Accounts with Bankers in the Country and in London; with accurate Tables adapted to the calculating of Interest Accounts with Ease and Dispatch; and to the discounting of Bills of Exchange: wherein the Table of Interest for one Day is extended to One Million Pounds, for calculating Interest Accounts on the Principle adopted by the London Bankers. Also, other useful and extensive Tables. To which is added, a concise and practical Treatise on Bills of Exchange and Promissory Notes, including Bankers' Cash, Notes and Checks.* In Two Parts. By WILLIAM LOWRIS, Sheffield. 8vo. pp. 294.

THIS author sets up for an instructor of tradesmen: p. 6 he tells us that on both sides of an account with a banker the interest is generally calculated at five per cent. There are few bankers who allow more than three per cent. for deposits, and many who allow nothing.

His interest-tables are less compendious, but more complete for five per cent. calculations than those already in use; but for interest at every other rate, the old books are seemingly more convenient. Mere inspection is perhaps an insufficient ground of decision.

In 1786 Mr. Thomas Hurry, of Great Yarmouth, published tables of interest for

one day from one pound to five hundred millions; in which the fractions of farthings are made integral in the lender's favour. That book appears to us better adapted than this to abbreviate the labour of a banker's clerk, and to increase the profit of his master.

Now that Great Britain is becoming a lending nation, and advances vast sums to colonial non-residents and to foreigners, it would be a public advantage to tolerate the advance of legal interest from five to six per cent. Pope Clement VI declared the exaction of interest to be heretical: such heresy is useful at least in this world.

ART. XLIV.—*Sketch of the Political State of Europe in February, 1805.* By W. HUNTER, Esq. 8vo. pp. 2q5.

THE state of Europe is so much changed in the short period of one year, that a sketch of its condition in February, 1805,

is of no more value than an old almanac. A vast confederacy was then forming to set limits to French domination: it has

since been dashed to pieces, and France has acquired a transalpine Gaul.

This sketch was intended as a sort of manifesto for that confederacy. Whatever inveighs against the ambitious, encroaching, restless violence of the French sovereign, is in its place. Not so some other passages. The antichristian sect domineers in continental literature; and Bonaparte is there hated for the restoration of catholicism. Instead of sighing over the irreligion and republicanism of the Montesquieus and Rousseaus, this writer should have invoked the reprobation of philosophy against the apostacy of the converted slaves of Napoleon, and their hypocritic adoration of Pius VII. Nor ought the assumption of a new imperial title by Austria to have been blamed. The dissolution of the German empire was at hand; and, without the assumption of a new imperial title, the rank of Austria would then appear to have declined. The flattery bestowed on the king of Sweden is sufficiently in its place: so is the conciliatory language expended on Prussia: but ministers ought to have been

aware, though authors need not, that these two friendships were nearly incompatible. The king of Prussia coveted Stralsund, which we were paying Sweden to fortify and defend. The lesser should have been sacrificed to the greater object; and Sweden neglected for the cabinet of Berlin. Holland ought early in the summer to have been powerfully invaded; as well in order to detain, from the invasion of Austria, the Gallo-Batavian division of the French army, as in order to have a gift, wherewith to allure the co-operation of Prussia. The Russian troops landed at Naples might earlier have been landed at Venice, and offered to the archduke. The confederacy has failed through the improvidence of man.

Of the Russian emperor Alexander more civil things might have been said. By founding such comprehensive institutions of public instruction, by conceding so great a liberty of the press, by limiting so considerably the institutions of vassalage, he has done much already for the civilization of Russia.

ART. XLV.—*Thoughts on the Civil Condition and Relations of the Roman Catholic Clergy, Religion and People of Ireland.* By THEOBALD M'KENNA, Barrister-at-Law. 8vo. pp. 193.

LIFE is frail, and power more so. How seldom the accidents of birth confide inherited authority to the virtuous man! how much more rarely does the wisdom of society correct the lottery of nature! It is, therefore, of high importance, and incumbent duty, to seize, as soon as they occur, the opportunities of political beneficence: they are lent but rarely, and never for long. There are public services, which to postpone is to endanger: of this class is the catholic emancipation; which, opposed, as it always will be, by the personal deference of the sovereign for the church, can only be conceded by his prudence in a time of national calamity, as the price of an union necessary to our safety.

This is a most instructive dissertation concerning the condition of the catholic clergy, and people of Ireland. It describes, in curious detail, their manners, prejudices, and reciprocal relations, and is well adapted to remove the apprehensions of the timorous, concerning the probable effects of withdrawing restriction. This pamphlet, however, seems drawn up for the instruction of a set of men of detail, such as one may suppose the Addington ministry to have been, who could not

ascend to those higher points of view, whence the statesman has to regard. Instead of supporting the catholic cause on the grand principles of justice and policy; and of pointing to the useful glow of allegiance which gratitude will inspire; a vast quantity of parish information is given, to shew that if the catholic priests have farms allowed them, and little salaries from the government, and the opportunity of domestic, instead of continental education, they will become attached to a patronising sovereign, and that they can and will attach to him a numerous ignorant savage multitude, of which they are the expedient instructors. These remarks are well worth the attention of office; as, even after the emancipation of the catholics, some subordinate patronage may be awhile necessary thoroughly to recover affections so harshly spurned aside. A more expedient form of patronage than the regium donum proposed by Mr. M'Kenna, surely, would be a repeal of the act of uniformity; and the consequent permission for catholic patrons to present the livings of their respective parishes to catholic priests. The Gothic king Theodatus said, "God keeps many religions,

why should not we?" The present revenues of the hierarchy are amply sufficient for endowing all the clergy who ought to be paid by the state. The plan here suggested is thus sketched :

"The Catholic hierarchy in Ireland consists of twenty-six prelates, and the warden of Galway, a dignitary enjoying episcopal jurisdiction. A moderate income annexed by government to each of these stations, and to a certain number of dignitaries in each diocese, together with the offices and professorships of the Royal College already founded, would, I think, be found sufficient to induce Roman Catholics, of good condition, to permit their children, when so inclined, to engage in the ministry; and to prevail on persons of pretensions, who have engaged, not to abandon the original sphere of their duties. The advantage must be incalculable, in forming the general character of the order, if you can draw within it, and afterwards retain in the country, men of education and talents; men who are accustomed to be respected, and who have the feelings incidental to that habit; men, whose early or whose long-continued impressions have been liberal.

"The number of Roman Catholic parish priests in Ireland actually exceeds one thousand; it would probably be expedient, (for the reasons and purposes already stated,) to decrease the number by an addition of about one-half.

"The expence of his peculiar worship, to a tolerably substantial farmer or mechanic, in the most opulent and Roman Catholic countries, amounts to about five skillings annually; the common labourer is, in the greater number of places, excused; where he is required to contribute, the accustomed rate is one shilling; this includes the contribution of the entire family, and for this the priest is bound to attend them when sick, even at the most unseasonable hours, and to administer confession when they apply to him. He is also to keep his chapel in order, to celebrate divine service, and preach on Sundays and festivals. In what I have denominated the Northern district, the emoluments of the Catholic parish priest are on an average, as I apprehend, from about thirty to fifty pounds per year; in the other parts of Ireland, these emoluments run from sixty to ninety pounds, varying with the opulence or with the customs of particular districts. In Munster the perquisites are highest, on account of a greater liberality in paying for marriages, which immemorial usage has established; the towns produce from one hundred to one hundred and twenty, or one hundred and thirty pounds per annum; in some very few instances they go so high as two hundred pounds. The bishops receive a small donation from every marriage, and a voluntary assessment of one to three guineas from each parish priest in the diocese. The bishop has always one parish; in some instances, where his receipts

are inadequate to his expences, he holds a second by *commendam*, which he administers by a curate. The bishop usually visits his diocese in each year, and holds assemblies of his clergy, called conferences, for the purposes of communication, discipline and instruction. There is perhaps a single instance of a bishop, whose living exceeds four hundred pounds; in general the income of this class, including the parish, amounts to about that sum in the best circumstanced districts. In other places they receive from three hundred to three hundred and fifty pounds.

"The stipend levied for the parochial clergy of the Catholics thus appears adequate to the comfortable subsistence of a single man; but it is precarious; it is obtained by mean solicitation; it induces habits inconsistent with any degree of firmness or elevation of mind, such as you would desire in the minister and magistrate of morality; such as you would emphatically desire, where a rude and unreflecting people are to be formed to more tractable habits, to be guided and not unfrequently resisted—it is not a necessitous, but a dependant and degraded order.

"The towns are in a good measure to be set apart from the present description. There is a sort of regular assessment in these places, which, with the occasional dues for marriage and christening, and the kind and generous devotion of procuring and requiting prayers for the deceased, renders the condition of the clergy tolerably reputable and commodious. In the North of Ireland, the Roman Catholics are, with inconsiderable exceptions, the poorest of the people; this circumstance accounts for the small recompence of the clerical function in that district, and for the greater difficulty in obtaining it. The main fund in the North arises from a pitiable, and almost ludicrous exhibition at funerals, which indeed daily declines, but which ought altogether to be removed, as an impediment to civilization. I cannot censure the priest, who has no other means of subsistence; but whilst he lives by such means, no respect or credit can be annexed to his character, especially in this age, when we advance so rapidly after our neighbours in the refinements or decencies of life, and when we are so much accustomed to confine our sentiments of respect to those who are placed by their situation above the appearance of necessity. In Connaught there is a very considerable body of Roman Catholic gentlemen, and the lower class are, with few or no exceptions, of the same religion; but the former are above attending minutely to the occasions of the clergy, and the latter are too poor, to be of any assistance—the substantial peasant, who labours and thrives by his industry, is not as yet so common in that district. The gentlemen, if the priest does not render himself objectionable, are ready to give him a liberal and hospitable use of their houses, and are, I believe, accustomed to make presents in kind of the several articles of agricultural produce,

but they are very little formed to the notion of assigning him a pecuniary and independent remuneration.

"In the remainder of the country, the face of society does not vary essentially—the prevalence of agriculture in this tract has formed a very numerous class of substantial and comfortable farmers; they are not prompt in their contributions—they require to be pressed, solicited, nay teased; it is, however, in one shape or other obtained from them; and where the priest has a farm, the working people, by immemorial usage, assign him a day in each season, for the several operations of husbandry; this custom (which once was universal), as well as the donations of produce I have just noticed, have fallen very much into disuse, since the demand for labour has increased, and since the value, both of that and of articles of produce, has been enhanced considerably.

"I would simply propose to introduce into our Roman Catholic ecclesiastical system the principle of fixed property, and the principle of preferment. I would reduce the duties to a certain compass, and allow leisure to fulfil them; some minor objects occur which may be turned to advantage in the correction of our people, and which therefore become momentous.

"I have already noticed the huts or hovels which occasionally appear to be dedicated to the worship of God, according to the forms of the Roman Catholic discipline. Indeed I am given to understand, that in a few instances the service is performed under a ditch, without any other shelter. This humiliation is not disgraceful to the people, it is their misfortune; but certainly there is neither honour nor ornament to the country, nor is it creditable to its gentry, that the worship of the God whom we all adore, upon principles in which we are unanimous, and according to rights not very foreign from those of the predominant or established church, should be, under all the circumstances of ancient and popular following, thus meanly and shamefully conducted. I would abate those nuisances—those monuments of churlish imbecility and faction. I would substitute decent and comfortable edifices—I would do so, in the hope that the people who frequent those places of worship might be induced, by the greater show of neatness and propriety, to attend their parish chapel in better apparel. The inferior Irish require to be led out of the habits of rags and filth into those of a certain elevation of mind and decency of appear-

ance; they require to be initiated in those wants which would prove a spur to their exertions, and give a more laudable direction to their expences.

"The new division of parishes would impose a necessity of building several chapels; where the old ones are in the condition I have described, it would be equally incumbent to replace them. Hitherto this charge has been left to the wealthy Roman Catholics, and those Protestants (I must say they have been many) who saw the propriety of making this provision for the popular worship, and paying this compliment to its followers. Those who act so deserve praise, but I cannot see that the foundation of a national improvement ought to come out of the pockets of particular descriptions. It certainly is a matter of as close interest to a Protestant, as to a Roman Catholic of property, to redeem the people from dissipation and nastiness; it is a matter of nearer interest, when the people to be so redeemed happen to stand to the former in the relation of his neighbour, his tenantry, or dependants.

"When the Roman Catholics of a parish are not able to provide themselves with a moderately neat and decent chapel, the judges of assize might have power to order the work to be done, and to direct the grand jury to assess the expence, like our other local improvements, by presentment. It would add to the merit and utility of the measure, if where there is a Protestant population, the chapel could be placed contiguous to the church, so that the respective congregations, at least at going to and from Divine service, might mix and be blended together."

This is buying the catholic clergy rather dear; yet it is evidently better to hire their allegiance than to set it at defiance. The foundation of schools, the diffusion of the art of reading, is the first and most essential step toward the abolition of fanaticism: surely the catholics could be induced to use a vernacular liturgy, which converts at once every place of worship into a reading-school.

There is a copiousness in Mr. McKenna's mode of writing, which at times fatigues; but his information is complete, his practical good-sense highly worthy of confidence; his sentiments liberal and gentlemanly, and his eloquence polished and splendid.

ART. XLVI.—*Outline of a Plan, for reducing the Poor's Rate, and amending the Condition of the Aged and Unfortunate; including those of the Naval and Military Departments: in a Letter to the Right Honourable GEORGE ROSE, occasioned by his Observations on the Poor Laws, &c. By JOHN BONE. 8vo. pp. 61.*

THIS pamphlet, although addressed to the Right Honourable George Rose, is not a reply to his 'Observations on the

Poor Laws,' or a perpetual commentary. It makes a pretext of that publication, which circulates much, for introducing

analogous topics to public attention. Mr. Bone inclines to the opinion that poor laws might be laid aside, and that a system of benefit-societies might be advantageously substituted. One of his schemes is to found a vast old-man's hospital, in which all those should have a right to spend their age, who would contribute in early life towards its maintenance.

The plan merits diffusion.

"1. That a subscription should be immediately commenced, for the purpose of establishing an asylum, for the aged and infirm of every description.

"2. That the subscription should consist, both of the voluntary subscriptions of the nobility and gentry who might chuse to patronize the institution, and of the contributions of those, of whatever class, who might chuse to provide for themselves in the case of age or infirmity.

"3. That preparation should be made for erecting very extensive premises, as near as convenient to the metropolis, and of sufficient extent, to accommodate all the contributors who may be likely to require it.

"4. That in the erection and contrivance of such premises, particular regard should be paid to their being provided with suitable accommodations and conveniences, to afford every pleasure and comfort that can be necessary to soften the effects of age and misfortune.

"5. That each contributor to the fund should be entitled, in case of necessity, to a distinct and entire set of chambers, for the use of himself and family, which should be as much their own, and for their own use, during the remainder of their lives, as any possession which they might have purchased in any other way elsewhere; subject only to such rules as the good order and tranquillity of the institution might require.

"6. That besides a dwelling, each should be allowed an annuity, with certain indulgences, according to the class in which he shall have contributed, and which should be divided in proportion to the sums paid.

"7. That those not chusing to become residents, should receive their annuities at their own dwellings.

"8. That voluntary subscribers should be privileged to recommend poor persons, whose poverty or misfortunes alone, have disabled them from making any provision for themselves; with limitation, that no person should be recommended who had omitted contributing to the fund, when the means were in his power.

"9. That all regular contributors should be at liberty to send their children to be educated and instructed in all the useful arts.

"10. That books should be opened at the office of the institution, to receive the applications of all persons in want of agents or

servants of any kind, and of all persons wanting places or situations; and that as it would be fair to argue, that those who contributed to the fund, were the most remarkable for the sobriety and prudence of their conduct, their applications should be attended to first.

"11. That rooms should be provided for persons coming to the metropolis, (and not having acquaintances,) where they might continue for short intervals, until they might find employment; in order to preserve them from falling into the hands of the artful and depraved.

"12. That cripples and disabled persons should also be admitted, upon the recommendation of subscribers, and be employed with due regard to their several infirmities.

"13. That poor persons should be allowed, upon moderate terms, to send their children to be nursed and educated, who would otherwise be obliged either to neglect their children, or the means by which they obtain a livelihood.

"14. That a bank should be opened to receive the small savings or earnings of the youth of both sexes, who have no dependence but their labour and economy, and to return them on the day of their marriage, with the interest and premiums proportioned to the amount.

"15. That baths and conveniences should be provided, to which itinerant dealers and wandering people might resort, to wash both themselves and their clothes.

"16. That the peculiar circumstances of marine and military persons, not permitting them to contribute regularly, like the other classes of the community, separate funds should be formed for them, in which they might deposit such sums as they might occasionally spare, and which should be returned to them in annuities, with proportionate premiums, in cases of age or infirmity.

"17. That the surpluses should be so divided as to indemnify those who might subscribe to the fund, without having occasion to apply to it for aid through life.

"18. That the institution should be under the government of a president and twenty-four directors, to be chosen by the subscribers of certain descriptions, from amongst themselves, and that certain great officers of state, and representatives of public bodies for the time being, should be members of the court. The immediate management to be vested in certain subordinate officers, who should be responsible for the good conduct of the institution, and for the due observance of all its rules and regulations."

Instead of building this protestant monastery near the metropolis, where the expence of founding and feeding such an institution is the greatest possible, why not construct it in some romantic situation of the cheapest provinces of the empire? Among the hills of Devonshire, or the

mountains of Wales, structures of this kind would cost one-half less to the patrons and inhabitants; and would, from their effect in the landscape, be more conspicuous and striking trophies of national beneficence. As the Jews had cities of refuge, so we might have cities of charity; in which dwellings for the insane, for the blind, for the crippled, for the aged, for the foundling, for the orphan, for the penitent, might be collected in beautiful arrangement. A metropolis is the very place in which to solicit funds for such establishments; but it is a needless sacrifice of the health of the inmates, and a needless waste of the contributions of the subscribers, there to rear the asylums of helplessness. In some of those sites which traffic cannot pervade, such as Craven hundred, in Yorkshire, a splendid city might thus be created by the concurrence of the eleemosynary virtues. Schools of medicine, and of theology, might, with advantage to the sufferer, be domesticated in the same situations. Every opportunity should be seized of withdrawing the needless population of London, which becomes too vast for the health and the morals of the people.

Another plan of the author is to provide baths for the poor; which, in the summer-season, would no doubt be throngingly frequented: they ought to be floating baths, as nothing but a running stream can adequately supply numerous bathers. The Greeks connected their public baths with the places of military instruction; and the young people, after doing their exercise, went into the water: in this climate, probably, it would be necessary to invert the order of application. It is highly expedient that soldiers should be taught to swim; highly expedient that all those engaged in dirty occupations should be regularly rinsed: utility, health, comfort, would all be consulted by the institution and free use of popular baths. Pliny says that public baths were first introduced at Rome in Pompey's time: but Agrippa was the great purifier of the Romans; for, during his edileship, one hundred and seventy public baths were constructed. Vitruvius describes a bath-house as usually consisting of seven apartments.

There are other benevolent plans in these pages, which merit discussion.

ART. XLVII.—*Observations on Charity Schools, Female Friendly Societies, and other Subjects connected with the Views of the Ladies' Committee.* By CATHERINE CAPPE. 8vo. pp. 177.

Mrs. CAPPE (the widow of the celebrated Newcome Cappe, of York, the eloquence of whose fast-sermon, and the learning of whose scripture criticism, are long to be remembered) has here laid before the Ladies' Committee of the Society for Bettering the Condition of the Poor, a series of observations concerning the education and management of the female poor, which merit a general attention. The best analysis will be a transcription of the table of contents:

"1. An inquiry respecting the manner in which children, who have devolved upon the parish, ought to be disposed of.

"2. On charity schools in general—first principles in their constitution, from which there should be no deviation.

"3. Inquiry, whether female charity schools, of whatever denomination, ought not to be regulated and superintended by ladies? Also, to what extent the hope may be entertained, should the foregoing reasoning be deemed satisfactory, that the various old-established charity schools throughout the kingdom will be new regulated on the general principles recommended by it: also, how far the ladies' committee may have the power of contributing towards this most desirable end?

"4. Inquiry respecting the description of poor girls to whose benefit it would be desirable that our old-established charity schools should principally be appropriated.

"5. Inquiry by what means it would be possible, so to proportion the various classes of private charity schools throughout the kingdom to each other, as that the number of young women educated in them, for servants of different denominations, might be, in some degree, suited to the probable demand for those of each particular description: also, how far the ladies' committee may have it in their power to give assistance towards carrying such a plan into effect.

"6. Objections considered to the admission in any case of the offspring of illicit connexions, or of profligate parents, into private charity schools; whether it would not tend to the encouragement of vice? whether it would not act as a discouragement to virtuous industry?

"7. Examination of the question whether the female children of the honest, virtuous, and industrious poor, may not be better educated, under the parental roof, more happily for themselves, and more acceptably to their parents, than in the best regulated charity school?

"8. Inquiry what would be the best, and most acceptable means of assisting the honest

and industrious poor, in the education of their children?

"9. Examination of the question, ought young females, on leaving a charity school, to be bound apprentice for their labor?

"10. Inquiry in what manner young girls, leaving a charity school, might be eligibly disposed of, if happily, the present method of binding them out apprentices, should be abolished?

"11. Objections considered, against the abolition of apprenticeships, taken from the danger of leaving a young woman to the guidance of her own discretion, at the age of sixteen or seventeen years.

"12. On friendly societies or benefit clubs.

"13. Some account of a female benefit club, instituted at Berwick in Elmet in November, 1778. Errors and omissions pointed out, notwithstanding its present flourishing state.

"14. Observations on the female benefit club instituted at York, August, 1788; its present state; annuity fund superadded in November 1800.

"15. Account of a female benefit club begun at York, January 1, 1801, by the enrolment of two hundred and forty honorary members, and completed by the admission of one hundred and fifty general members, on the 24th of the following June.

"16. Observations on the above institution: necessity of its being established on so large a scale.

"17. Sketch of a female benefit club in the parish of Thornhill, in the West Riding of this county, established on the 1st of September, 1804.

"18. General observations on friendly societies. Principles essential to their answering the ends for which they are instituted, and therefore considered by the author as fundamental in their formation.

"19. On the great importance of the plan of the ladies' committee: obstacles they will have to encounter: considerations on the best means of overcoming them.

"20. Inquiry how far some other parts of the plan of the ladies' committee may be prac-

ticable, and by what means some difficulties, which appear formidable, may at length be overcome."

Of all these very interesting and instructive enquiries the most important, and that which most requires legislative interference, is perhaps the case of female apprentices. They are too commonly the starvelings of parsimony, and the premature victims of a niggardly libertinism. Why tolerate enduring contracts? Why cannot every agreement be made by the year, and for the year? The power is excessive, and it is very frequently abused, which masters have obtained over their apprentices of both sexes. It would abolish a great deal of household strife and cruelty to quash this legitimate despotism. Apprenticeships are, for the most part, fraudulent contracts, in which the master takes advantage of a child's ignorance, and of its parents' impatience of the voracity of adolescence, to purchase three or four years of its labour at one-fourth below the value.

Every part of this book is valuable: the appendix contains useful documents for founding friendly societies of females. The civic duties of women form a new branch of morality, which it is the merit of the present age to have brought into busier practice. The deaconesses of the primitive church did indeed, in many respects, render to the poor services analogous to those conferred by the superintendants of our friendly societies, but there was less of wisdom and discrimination in the end and direction of their efforts. The Fabiola of Saint Jerome, who is said to have founded the first hospital for the sick poor, does not appear to have given personal attention to its management.

ART. XLVIII.—*War in Disguise; or, the Frauds of Neutral Flags.* 8vo. pp. 215.

THIS tract is ascribed to an eminent civilian, who wrote under the patronage of his majesty's late ministers. It has made that sort of impression which usually attends a pamphlet supposed to be official: the merchant buys it, in order to square his precautions accordingly: the placemen all have it at your service: if you meet a clergyman in company, he enquires whether you have read it.

Yes, we have read it, and read it with sorrow. It proposes to this nation to revoke its own concessions, to dissolve into a nest of pirates, and to become the pest

of the seas, as France is of the land. It tends to bring on an immediate rupture with North America, and a fresh combination of the Baltic powers, to cripple our maritime ascendancy. The counsel it offers is doubly pernicious; very impolitic, and somewhat unjust.

The objections ought to pass into circulation; we shall therefore be minute in our criticism.

The author begins by barking at Bonaparte. When an Englishman meddles with conduct which he feels to be unbecoming, he sets about accusing the French of an-

lous oppression; he secretly intends their precedent both for an example, and an extenuation. Among the paragraphs adapted to irritate our anti-gallican passions, others are interspersed, which pretend that war has changed its character, and is become a cause of opulence. This is ignominiously inferred from the notorious circumstance that, during the anti-jacobin war, the West Indian trade of Britain flourished, which arose from the devastation of San Domingo, and some other seats of tropical agriculture; in consequence of which, vast additional lands could be cultivated by it, without overstocking the European market with produce. Produce sold dear, not because there was war, but because there was scarcity. Unless missionaries were sent to make insurrections of slaves in Cuba and Carolina, mere war would not again raise the price of sugar, coffee, and cotton: the seats of culture have shifted, but the production meets the average demand. The argument from revenge, and the argument from cupidity, to begin a war against neutrals, are feeble and paltriness.

Next comes the author's strong-hold: his argument from the pretended principles of international law.

According to the rule between nations, enemy's property found on board neutral vessels is lawful prize. In the *Consolato del Mare*, it is laid down as a rule,—*Se la nave, o navilio, che pigliato sara, fusse di amici, e le mercanzie, che lui portera, saranno d'inimici, lo ammiraglio della nave, o del navilio armato, può forzare e costringere quel patrone di quella nave, o di quel navilio, che lui pigliato avera, che lui, con quella sua nave, gli debba portare quello, che di suoi inimici sara.*—Thus not only enemy's property found on board a neutral is lawful prize; but the neutral is compellable to bring the property to the port indicated by the captor. He is, for this, to be allowed freight. Albericus Gentilis relates a case where the Tuscans took the effects of the Turks, at that time their enemies, on board some English vessels. The case was tried; the Turkish goods were determined to be legal prize; but the captor was ordered to pay the freight to the English: it being a principle that what belongs not to the enemy cannot be acquired by war.

Grotius is not explicit on this subject. He countenances the opinion, that not enemy's property in general, but only instruments of hostility, are seizable in neutral bottoms. The modern doctrine seems

to derive from him, that neutral ships make neutral cargoes, with the exception of what is called contraband of war. His words are: *Quare quod dici solet hostiles censeret res in hostium navibus repertas, non ita accipi debet quasi certa sit juris gentium lex* (lib. iii. c. vi. § 6); where the word *hostium* is plainly a slip of the pen for *amicorum*, the ships and cargoes of enemies being of course confiscable, or condemnable: yet Puffendorf has not detected this error of phrase, but comments the passage as if it were correct.

Bynkershoek disinclines to this doctrine of Grotius, that a neutral vessel neutralizes her cargo, and says expressly:—*Non sum qui videam, cur non liceat capere res hostiles quamvis in navi amica repertas; id enim capio quod hostium est, quodque jure belli victori cedit.* So says also the French naval ordinance of 1681.

The difficulty which Grotius felt in defining what is enemy's property, when found in the ships of neutral countries, can only be eluded by naming certain articles as illegal. Merchants are now so accustomed to provide proofs that the property of a given consignment vests in a neutral house, that it is become the object of a regular per centage, to furnish a vessel's cargo with papers proving it to be American. There is sometimes an honest, there is oftener a mimic, transfer. This is the fraud against which our author inveighs with so much bitterness, which he represents as so useful to our enemies, and so detrimental to us; which he calls a war in disguise, and which he wishes to punish by the indiscriminate seizure and condemnation of all neutral vessels which have taken their cargoes in colonial ports.

The Americans admittedly go to Port au Prince in San Domingo, and receive on board cargoes of coffee, sugar, and cotton, which are, in the ship's papers, specified to belong to American merchants resident in Charlestown. The vessels, on their arrival in America, are often provided with fresh papers, without being unloaded, and come to Europe to deliver such cargoes at Bourdeaux; the fresh papers still specifying the property to be wholly American. So, from the Havannah, dollars, indigo, tobacco, are carried to Salem; there provided with fresh papers, and thence carried to Bilbao or Cadiz. These vessels are known to bring the produce of French planters to French ports, and of Spanish planters to Spanish ports; but if our cruisers seize the vessels, and bring them hither for adjudication, the papers are such

that the court of Admiralty decides for a release.

Why should this trade be interrupted ?

1. It destroys both the French and the Spanish nursery for sailors. While the colonial intercourse was carried on, as in former wars, under hostile flags, protected occasionally by convoys, French sailors and Spanish sailors were employed in every voyage to and fro. Now, all the sailors employed are Americans.

2. It provides a nursery for British sailors. At the breaking out of a war the English government presses from the merchant service the men requisite to man the navy: the merchants immediately raise their wages, and this tempts Danes and Americans to come and assist in navigating the merchantmen. Whatever increases the number of Danish sailors, assists in manning the merchantmen of the Eastern coast; whatever increases the number of American sailors, assists in manning the merchantmen of the Western coast. During the American war there was much fraudulent neutralization, which the Danes covered, and which they repaid by furnishing our merchantmen with sailors: during the present war there is much fraudulent neutralization, which the Americans cover; and which they would repay in like manner, if we were now distressed for sailors.

3. A large share of the profits of this neutral trade centres in Great Britain. The voyages are, almost without exception, insured at Lloyd's; and the property is there so well known to be often enemy's property, that written engagements are exacted of the insurer, that he will not, in case of loss, dispute the neutrality of the property. In this form a percentage of five or six in the hundred, is levied on all the property so brought to Europe. Of the vessels employed a great number have joint owners in Great Britain. When the consignments are really purchased by the American merchant, who, in this case, often buys on half-account with an English house, they come consigned to London, with a liberty in the connected house here to change their destination, for Cadiz, Bourdeaux, Hamburg, according to the prices of each market. The cargoes thus circumstanced leave not only a commission, and various charges to the British merchant, but half the clear gain besides. Every branch of this trade yields a tribute to British prosperity.

But, it is contended, this neutral transportation, on account of the cheap insur-

ance, carries the produce of the French and Spanish West Indies cheaper to Antwerp and Hamburg, than English transportation. The continent buys, consequently, in preference of the French and Spanish settlements; whose agriculture now thrives faster than that of the English islands. The answer is:—Open the ports of the British islands to the same commerce: break up that suicidal monopoly, which retards, in all our islands, the settlement of merchants, the progress of agriculture, the increase of reciprocal consumption, the demand for our manufactures, the variation of productions and occupations, and the growth of every form of prosperity; a monopoly, which ignorance devised, and tyranny perpetuates.

In order to find a pretence for destroying a useful branch of trade, very profitable to this country, and conducted in all the acknowledged forms of licit intercourse, our author is obliged to quit the law of nations, which, as we have shewn, sanctions this trade, and to recur to what may be called British cosmopolitical law; to those public rules which the British courts of justice prescribe for our conduct toward other countries. These rules are versatile as our administrations; for the Crown claims and exercises a dispensing power, (and a most mischievous prerogative it is,) which, with the advice and concurrence of the privy council, can at any time, and frequently does, vary its directions to our admirals and cruizers, concerning the description of vessels liable to seizure. These orders become, in the court of Admiralty, rules of adjudication: indeed they emanate from a power to which an appeal lies from the court of Admiralty: and thus our cosmopolitical law, or rule of intercourse with the rest of the world, escapes the proclamation of parliamentary discussion, and the check of independent tribunals.

It is only in this sort of law, if law it may be called, arbitrary and despotic by its nature, given perhaps by caprice, perhaps by ignorance, never, we trust, by venality—that something like a pretence can be found for invading the security of this neutral American shipping. In the war of 1756, all the neutral ships which took in cargoes in the French colonies were detained, and the cargoes condemned as enemy's property. The fact of receiving a loading in a colonial port which was, during peace, shut to neutral commerce, was held sufficient evidence of the cargo being hostile property. A neutral, it was plausibly

contended, has no right to deliver a belligerent from the pressure of his enemy's hostilities, by trading with his colonies in time of war, in a way that was prohibited in time of peace.

It is admitted, however, even under English cosmopolitical law, that a neutral has a right to carry on his accustomed trade to the utmost extent of which that accustomed trade is capable. Sir W. Scott so argues. Now it is notorious that the French have been progressively relaxing their colonial monopoly ever since 1778, when the disturbances in North America became objects of their patronage. Thus in 1781 we seized and released the *Niger* and *Copenhagen*, neutrals trading to the French West Indies. This relaxation of monopolous policy has been so rapidly and systematically progressive, that, before the antijacobin war, the colonial assembly of Guadaloupe, and soon after Cayenne, the governor of the windward islands, opened indiscriminately the ports of these French colonies to the American commerce. The troubles of St. Domingo induced, less formally perhaps, the same effect. The Americans have ever since enjoyed this branch of traffic: so that, on the principles of English cosmopolitical law, it is a trade they have a pre-emptive right to pursue.

In the treaty made between his Britannic majesty and the emperor of Russia on the 17th June, 1801, the third article declares what property shall be considered as neutral in these words: "That the effects embarked on board neutral ships shall be free, with the exception of contraband of war and of enemy's property; and it is agreed not to comprise, under the denomination of the latter, the merchandise of the produce, growth, or manufacture of the countries at war, which should have been acquired by the subjects of the neutral power, and should be transported for their account, which merchandise cannot in any case be excepted from the freedom granted to the flag of the said power."

Here is a positive convention with Rus-

sia in support of the American practice; now the Americans are entitled by treaty to be put on the footing of the most favoured nation. If, therefore, these concessions do impair the rule of the war 1756, (a rule never acceded to on the continent, for France* protested in 1758 at Petersburg against it) the author is not justified in asserting that this country has never relinquished the principle. A very absurd relinquishment, we grant, because the nature of the rule of the war 1756 required that to load in a colonial port, shut during peace, should in a neutral be sufficient evidence of the shipment of enemy's property. But ministers, during the last thirty years, seem never to have taken the trouble of thinking over the operation of a general principle: and now they propose to break their agreements because they find out they have made them ill.

We trust that the present ministers of his majesty are actuated by principles more liberal, and more consistent, than those which have so often oppressed commerce under their unfortunate predecessors; that they will place public justice and cosmopolitical virtue in the destruction of monopolies; in the repeal of the navigation laws; in the facilitation of commerce to the numerous rather than to the incorporated orders of tradesmen; and that in their future treaties they will propose to abjure, on both sides, the right of capturing merchant ships, and thus reconcile a perpetual commercial peace with military, and even with naval hostility.

The separation of the American half of the English nation from the British empire ought no longer to be viewed with displeasure, but with approbation. It is thus enabled to preserve neutrality during the warfare of the belligerent half; and to lend the convenient aid of its flag and its privileges to conduct a common commerce, which is thus rendered independent of the caprice of cabinets, and the piracy of naval adventurers.

* It was this protest which laid the foundation of the armed neutrality.

CHAPTER IV.

ANCIENT CLASSICS, CLASSICAL ANTIQUITIES, MYTHOLOGY, &c.

CLASSICAL Literature, though much studied in England, and illustrated by a few works of great and acknowledged eminence, yet is not a province in which English editors and writers have often chosen to exercise their talents. Hence our catalogue of domestic publications under this head is as usual scanty, while our metropolis and universities continue to furnish an ample opening for the reception of the never-failing productions of German industry and learning. Among these an edition of the poems, bearing the name of Orpheus, by Herman, is distinguished by erudition, industry, and boldness sometimes approaching to temerity. In our own country, Mr. Walpole has edited some elegant specimens from the fragments of the ancient Greek comic writers. He has also afforded us another proof of his industry, by a volume, consisting partly of translations from the classics, by old and neglected authors, and partly of various copies of verses, the productions of his own pen, both original and translated from various languages. Mr. Good, in his translation of Lucretius, has given a faithful and spirited representation of that great, and almost unrivalled, didactic poet, accompanied with a commentary displaying a cultivated taste, and uncommon variety of learning.

ART. I.—*Orphica, cum Notis H. STEPHANI, A. CHR. ESCHENBACHII, T. M. GESNERI, TH. TYRWHITTI. Recensuit Godofredus Hermannus. Lipsiæ, 1805. 8vo. pp. 1026.*

THE fabrications, which bear the name of Orpheus, collected in this ponderous volume, are in themselves little interesting to the reader of taste, and of little importance to the cause of sound literature. We have, however, been induced to select them from the mass of German publications to which the late, like preceding years, has given birth, by the celebrity of the editor under whose name they appear, and the curious nature and original matter of the ample dissertation which he has appended to them.

The pieces commonly denominated Orphic, and which, as they pass under that title, though they seem to possess no other species of connection, have usually been published in conjunction with each other, are, 1st, a tedious poem of nearly fourteen hundred verses on the subject

of the argonautic expedition: 2ndly, a collection of mystic hymns, perhaps of different ages, and some of them probably of considerable antiquity: and, 3dly, a poem on gems, and their fabulous properties, medical and magical. The last of these poems includes no mention of Orpheus, and no evidence that the writer of it intended to ascribe it to that poet.

Editions of these writings have already appeared in numbers sufficiently adequate to their merit. The first is that of Florence, published by Junta in 1500, a work of great rarity, containing the argonautic and the hymns. These were republished by Aldus, at Venice, in 1517, along with the poem on the loves of Hero and Leander, and with the addition of the lithica. To these succeeded several other editions, none of which it is necessary to mention.

except that of Gesner, comprising the collected works, with the notes of preceding editors, and his own; and those of the lithics and argonautics separately, by Tyrwhitt and Schneider.

The editions of Gesner and Tyrwhitt, with the exception of the Latin versions, are embodied in this publication. Many notes are also added by the present editor, which display his ingenuity, and his very extensive, and commonly accurate, knowledge of the Greek language, not without some infusion of his customary bile. The version of the argonautics, by Cribellus, is retained (as being made from a valuable manuscript, which we suppose is at present either not extant, or not accessible), along with the curious translation of the hymns by Scaliger. The various readings have been collected by the collation of several MSS. (the most valuable are stated to be those of Vossius, Ruhnkensius, and Vienna), and some ancient editions.

These pieces, like most of the other minor Greek poems, have descended to us in a very corrupt state. The editor has, therefore, taken considerable liberties in reforming them by conjectural emendation. "Textum argonauticorum, hymnorum, et lithicorum," says he, "ita ut corrigendus mihi videbatur, refinxi. In argonauticis quidem, corrupto opere, si quid fortasse audacius mutatum videatur, æqui lectores, non modo multitudinem vitiorum et magnitudinem reputabunt, sed illud etiam recordabuntur, haud paullo difficilius esse malum, quam bonum scripturam emendare." Many of his conjectures are certainly ingenious; but we doubt the propriety of inserting them constantly, however violent, into the text. We cannot but prefer the modesty of Tyrwhitt, who has made his notes the vehicles of many most ingenious emendations, but has cautiously abstained from introducing them, however probable, into the text of his author.

On the argonautics and hymns we shall not dwell; as a minute enumeration of the various readings, by which they are justified or defended, would perhaps be tedious to our readers. With respect to the former we shall only observe, that the editor appears to us to have introduced, with much too great frequency, his favourite expletive *ei*, for which, indeed, he seems to have sought a place wherever it was possible that it should exist.

As we are indebted for the best edition of the lithics to a very ingenious and learned scholar of our own country, that

poem is likely to have received in England a greater share of attention than the others by which it is usually accompanied. We shall, therefore, proceed to give a faithful account of the various readings of a considerable portion of the text before us, collated with that of Mr. Tyrwhitt. The only advantage of authority which the present editor appears to have possessed above his learned predecessor, is an inedited exegesis of Tzetzes on the Iliad of Homer, preserved in a public library at Leipsic, containing several verses of the lithics, which are corrupt in the common editions, in a correct state, and confirming the previous conjectures of Tyrwhitt and other critics.

Ver. 5. *νηπιτιοισι* for *νηπιτυβοισι* is adopted from the note of Tyrwhitt.

7. *αγαλλομενης* from the conjecture of the same critic.

11. The order of the words *Κρονιδης τανων* is changed, to remedy the short syllable in *cæsurâ*.

14. For *χαριοντας* is substituted, from the emendation of Ruhnkensius, *χαριοντες*.

17. On account of the preceding *ος κεν*, for *αωγωσι*, is read *αωγη*, by conjecture.

18. *εσελθεμεν*, from Tzetzes.

22. For *αικις*, *αικις*, which form is also substituted in another instance, 140.

28. For *αντικρυς*, *αντικρυ*.

35. For *χυρσειν επι λεχος αιεν*, is read *λεχος αιεν επι χυρσειν*, to give a better support to the short syllable in *cæsurâ*.

39. 'αλ', necessary both to the sense and the metre, is inserted from the conjecture of Tyrwhitt.

42. The final *ν* is added to the word *τισσσι*, to sustain the short syllable. We mention this merely to denote the canon of prosody, which is adopted on this subject by the professor, the application of which occurs in several other instances.

43. In compliance with the epic form, for *αικε δελησι*, T., *αικε εδελησι*, H.

53. For *εκασψ* T., *εκαστην*, H. Neither the common nor the new reading is free from difficulty: *εκασψ* can scarcely be used for *cuiquam*, in which sense alone it affords any meaning; and *εκαστην* is perfectly unnecessary.

57. For *αφικηται*, from the conjecture of Tyrwhitt, *εφικηται*; for *ος τ'*, from the rules of the language, *ος κ'*.

60. For *αιοιδυ*, *αιοιδης*, a plausible conjecture.

62. In a verse indubitably corrupt, the conjecture of Hermann, inserted in his text, is perhaps the best which has been offered. *αλλα σε, πρεσβα δαζμοσυνη*.

67. Difficulties of prosody and grammar are avoided by reading *θεός επωπιζεμεν αιεν εοντας*.

68. For *ανδρων, αγγων*—the conjecture of Ruhnkenius.

70—72. The ingenious conjectures of Tyrwhitt are deservedly adopted, with the addition of a necessary grammatical alteration, *τευξωσι* for *τευξοσι*. We shall not, perhaps, be considered as digressing too far from the subject, if we take this opportunity of mentioning a corrupt reading, which maintains its place in all the recent editions of Homer, *Od. vi. 262, αυταρ επιν πολιοσ επιβησομεν*. This reading is vicious, as giving an intransitive sense to a transitive verb, and as placing a future indicative where an aorist subjunctive is required, in this connection, by the preceding *επην*, though, by the grammatical figure called systole, *επιβησομεν* may indeed be considered as the subjunctive aorist. The valuable Harleian MS., 5674, in this passage reads, without doubt justly, *επιβηρομεν*, which appears also in the Florentine edition of 1488, and the Juntine of 1519, and probably in most MSS., and in most printed editions previous to the publication of Eustathius, in whom the common reading is found. In *Od. K. 334*, the common editions, by the same error, read *επιβησομεν*, the Florentine and Juntine, *επιβηρομεν*.

73. *αμερδεις*, the conjecture of Tyrwhitt, is adopted.

77. *φασσιμβροτε*, the conjecture of Gesner.

78. *δαμαζοιτο*, from Tyrwhitt.

82. For *εμ ιπισχνημαι*, *εμεθεν σευμαι*, the former word from ed. Ald., and cod. Par.; the latter from conjecture, to replace a word not usual in the epic writers. Homer, however, uses *ιπισχομαι* in the same sense. The conjecture we think not necessary, and its admission into the text not warranted; it is, however, in itself not improbable.

84. *διζωμαι*, from the conjecture of Tyrwhitt, whose note has been by some accident omitted.

85. *μεροινησαι*, from Gesner, to preserve the uniformity of the mood.

86. *εξερεινη*, for the same reason.

89. For *ακαπνεντες*, certainly corrupt, *αδμαινοντες* by conjecture, the former word being considered as a gloss for the latter. Yet the authorities adduced in the index of Tyrwhitt, induce us to prefer *αινα ποναντες*, the conjecture of Portus.

90. For *εφ, συν*, to avoid the hiatus, in a situation of the verse in which, however,

in our opinion, it is not wholly inadmissible.

107. *τειος*—80 Musgrave.

108. *ορεξαμενον δε οκουστας*; a good conjecture of Portus, which we wonder that Tyrwhitt did not receive into his text.

110. The editor successfully vindicates the common reading *κην* against the conjecture of Tyrwhitt. This power of *κε*, though not uncommon, has not been much noticed except by modern grammarians.

111. *αντις*, according to the orthography of the epic writers.

113. *οροντες*, from Tyrwhitt.

116. For *πλειω*, is well read *πλειην*.

118. For *αλαληντο, λεληντο*. Though the common reading is doubtful, the conjecture is too hazardous to be inserted in the text.

119. *δεινον*.

120. *λαφυζαι*, from the conjecture of Bernard.

123. *οισσατο*.

130. *αφ* for *αι*.

141. *αδ' αρα*, from Tyrwhitt.

145. *χω μεν εκεσσυτο*, from the same.

147. *λαθεν*, from the conjecture of the editor, the reason for the preference of which to that of Gesner; received by Tyrwhitt, we do not discern. Either of them is admissible, and one of them necessary.

148. *απο*. Tyr. and Musg.

149. *ενιτηζας*. T. and M.

159. *λασαις*, from Ruhnkenius.

172. *αιδει*, by a probable conjecture.

173. *παρα*.

182. *παλαιγενεες*, from Tyrwhitt's conjecture.

183. *φλογας*, from the same.

186. *αυτος*, Gesner.

192. *ανακτιπην*.

195. *οι δ' αρα*, an indubitable emendation.

200. *οτι*, from Aldus.

207. *περιμυκησωνται*. In the preceding line should probably be read *παροπτης* (Il. xvii. 30.), as depending on *επην*.

209. *κυανανγεων*, a conjecture preferable to that of Tyrwhitt.

213. *ερχει* for *ερχε*.

214. *καρποφορον*, Tyr.

217. *υται*, Gesner's conjecture, accommodated to the measure.

218. *Σην*, from Schneider.

226. This verse is silently, but justly, corrected by reading *νω*.

227. *εκ' αραων*. Tyr.

228. *πετρηκεα*.

231. *κην* for *και*.

238. Where a conjecture is necessary,

that of Herinan, *κρρα δοιω*, seems the best.

246. *φερη τε*, the corruption of the passage is certain, and the remedy not improbable.

248. *εφης*, a grammatical correction for *εφους*.

251. *χαιρις*, the certain emendation of Ruhnkenius.

265. *ρεζη*.

267. *ηδε γαρ* — *αγει*. We should prefer *ηδε κεν* — *αγοι*.

268. The emendations of Tyrwhitt are adopted.

273. This verse is well corrected, *αμ-φιστησι ενιπλειςιο*.

274. *κυρος*, from Tyrwhitt.

282. *εακρυσει λιδυ μενος*, from Bernard.

292, 3. From the emendations of Tyrwhitt.

297. The correction of Musgrave is adopted.

300. This verse is well corrected from conjecture, *δι κε* — *φορευσιν*.

301, 2. The punctuation of these verses is altered according to the observations of Tyrwhitt. The latter of them, partly from the conjecture of the editor, and partly from that of Tyrwhitt, is also read thus:

Μαγγισση, τηντ' εζηχ' εφιλατο θυριος Αρης.

303. *κελαση*, a grammatical emendation.

304. *αγανοφρονα*, from Musgrave.

306. *αιρει*, from the same.

309. *παλυνη*, vid. 303.

310. *υπερδυασιο*, from Dinnerus.

313. *σωμα*, from Pierson; *φυλασσει*.

325. The verse is supplied by the insertion of *τοι*.

326. *φθελξαμαι, αν γγ' αιψα*.

331. *γαρ τοι*, from Tyrwhitt.

332. The emendations of Tyrwhitt are adopted.

335. *δειδεμεν*, from the same.

339. *συν* for *νυν*, a necessary emendation.

347. *οτις κ' ακριβο*.

349. *αρτεμεεσσιν*, Ruhnkenius.

350. *Παρις*, Tyr.

We had intended to have continued this collation through the poem; but as the variations are so numerous, and many of them so minute, we feel that it would be abusing the patience of our readers to proceed. The instances which we have already given will be sufficient to furnish a specimen of the edition.

The most important part of this volume

is the annexed dissertation, the purpose of which is to ascertain, by arguments of internal probability (especially such as relate to the prosody), the age of the argonautic poem.

The period when this poem was probably composed, has been, and continues to be, a subject of considerable doubt. It furnishes an instance of literary imposture which, in all ages of the Greek history, appears to have been pretty frequent, and to which the scarcity of books in these ages was calculated to give great facilities. And if the poems of Rowley at one period gained credit in England, and imposed on an enlightened age, it will not excite our surprize if similar adventurers met with similar success in periods when the art of criticism had been less cultivated, especially when they came forward under the sanction of names consecrated by popular superstition or enthusiasm. Onomacritus is perhaps one of the earliest of these falsifiers whose names remain upon record. He is mentioned by Herodotus (vii. 6.) as banished from Athens by Hipparchus, in consequence of having been detected in the act of interpolating some supposed oracles of Musæus. He was afterwards reconciled to the family of the Pisistratidæ, and contributed to encourage the expedition of Xerxes into Greece by illusory predictions, adapted to flatter the vanity of that monarch. To this worthy prototype of such as in subsequent ages have amused themselves, and displayed their ingenuity in a similar way, the argonautics have been by many, with little probability, ascribed. Toup (Em. in Suid. ii. 98.) is inclined to consider them as the work of Cleon, a writer mentioned by the scholiast of Apollonius. Ruhnkenius, whose remarks upon this performance occur at considerable length in his second epistola critica, without assigning an author, affirms its antiquity in decisive terms, as at least not posterior to the age of the Alexandrian poets. Valckenær, by an incidental expression, seems to treat the imposture with contempt, and Schneider regards it as the barbarous and tasteless work of some ignorant Greek in a comparatively recent age.

The want of external testimony leaves the question to be determined by arguments of probability. It does not certainly appear that this work is once quoted by any ancient writer. Ruhnkenius (and who is a more competent authority on such a subject?) allows the fact in general, though he attempts to make a few obscure

exceptions; his authorities, however, which are only two in number, appear to fail him, as one cannot be shown to allude to the work in question, and the antiquity of the other is disputable. If the date, therefore, of this poem is capable of being fixed with any degree of probability, it must be from the internal evidence to be deduced from the investigation of the work itself.

Some German critics, mentioned by Hermann, have attempted to collect that evidence from the geography of the poem: the result is, however, too uncertain to be depended upon. A more probable mode of approximation to the truth, is that adopted by the editor himself, who divides the epic poets into classes, according to the styles of versification prevalent in different ages, by a comparison with which he attempts to assign the place of the author of the *Argonautics*. If the poet himself is of little importance, the observations and researches to which he gives occasion may at least prove valuable.

The classes into which the epic writers may be divided, according to our author, are the following:

I. That of Homer and Hesiod, which he considers as immediately subsequent to the origin of poetry among the Greeks, the distinctive characters of which are, certain liberties practised with respect to the quantity of syllables in the middle of words, the lengthening of short syllables in *cæsura*, the admission of the hiatus, and the use of the digamma.

II. The age of the *Homeridæ*, or rhapsodists, comprizing parts of the *Iliad* and *Odyssey*; most of the *Homeric hymns*; and the shield of *Heracles*, ascribed to Hesiod. These writers, says the editor, retain the power of the *cæsura*; they admit the hiatus, but with much less frequency than was allowed in the *Homeric age*, while they abstain from other licences; they preserve the use of the *Æolic letter*.

III. The age which succeeded the disuse of the digamma, admitting the hiatus only in phrases borrowed from the ancient poets, in which it was often occasioned by the omission of the obsolete letter. The power of the *cæsura* is supposed to be the same as in the preceding age, and to this period is referred the hymn to *Mercury*.

IV. The writers who are comprized within this period extend from *Aratus* to *Manetho*, including the poets of the *Alexandrian school*. Their numbers are sup-

posed to be more polished, and more restricted to rule, than those of the preceding periods; the very knowledge of the digamma, as employed in heroic verse, was obliterated; the licences of the power of the *cæsural pause*, and the hiatus, were admitted only in phrases and hemistichs borrowed from Homer and Hesiod. Yet the digamma in one case (the use of the pronouns *ᾠ* and *ῆ*) uniformly and remarkably preserves its force.

V. The last age is supposed to have declined gradually to negligence and barbarism of numbers, from which it was rescued by *Nonnus*, or some other writer, who established a system of heroic versification, differing in some respects from that of any of his predecessors, and subject to strict laws. The writers of this school employ, with much greater frequency than the preceding poets, the trochaic *cæsura* in the third foot; they scrupulously abstain from the same *cæsura* in the fourth foot, which is indeed little used by the poets of any class; the syllable preceding a mute and liquid is always made long; the hiatus is only admitted in a few forms taken from Homer, and the power of the *cæsura*, in lengthening the short syllable on which it falls, is wholly abrogated.

The following circumstances are assigned, by M. Hermann, as furnishing the chief distinctions in the structure of the epic verse as employed by the poets of different ages and classes; the situation and nature of the *cæsural pause*; the degree of efficacy which that pause is permitted to exert in sustaining a short syllable; the admission or rejection of the hiatus: and the influence of a mute and liquid on a preceding short vowel. The rules laid down on these subjects are applied to the practice of the principal writers of heroic verse, from *Theocritus* till the latest ages of Greek poetry, and many passages of their works examined by a reference to them.

I. In Latin, the principal *cæsural division* of the heroic verse is formed by a long syllable succeeding the second foot. In Homer, the same pause is employed with great frequency: there is, however, another pause, which is used by that poet with almost equal familiarity, formed by a trochaic division of the third foot, as in the second verse of the *Iliad*,

Οὐλομένην, ἣ μυρὶ ———

The use of this *cæsura* seems gradually and almost regularly to have increased in

frequency through the subsequent ages of Greek poetry. In the Alexandrian writers it begins to be predominant; in most of the authors subsequent to the christian æra it abounds; and in Nonnus, and some very late writers, the use of it becomes almost general. The usage of a poet, in this department of versification, may afford some indication (though not to be relied on without other circumstances of confirmation) respecting the age in which he lived. We may here observe that the transition from the ancient to the recent practice does not appear to have been so marked and sudden as M. Hermann seems to imagine, but to have been accomplished by several intervening steps, as may be collected from the writers who flourished between the ages of Homer and Nonnus. The practice of the pseudo Orpheus, in this respect, sufficiently accords with the supposition that he flourished in an age subsequent to the christian æra, but preceding that of Nonnus.

It is remarked by M. Hermann, and apparently with justice, that the heroic poets of all ages seem cautiously to have abstained from a trochaic division of the fourth foot. This remark will admit of some practical application in the division of words. In the 5th verse of the Iliad, Heyne, to preserve the Ionic form of the imperfect, reads *δε τελειετο*; *δ' ετελειετο* is requisite, or at least preferable, for the versification.

II. It is well known to every reader who is in any degree versed in the writings of Homer, that a short syllable in cæsura is frequently made long by the force which that situation of the verse is calculated to throw upon it, though generally perhaps not without some support from the succeeding syllable. And even in Homer, where the necessity of recurrence to this licence could be avoided by the insertion of the paragogic letter, or by any other means, such assistance seems to have been adopted. In subsequent writers the admission of this liberty seems to have been confined to Homeric forms and phrases, and at length to have been totally disused. In estimating the age of an author, this is, therefore, a circumstance which deserves regard. The author of the argonautics adopts the practice of the poets preceding the age of Nonnus.

III. In the present editions of Homer the hiatus appears to recur perpetually. It is, however, commonly remedied by the insertion of the digamma; and in the remaining instances the admission of it

appears to have been, generally at least, regulated by certain rules. One of the places in which it is admissible, though unnoticed by Hermann, seems to have been established by Mr. Wakefield, as succeeding the trochaic cæsura in the third foot. If this remark is well-founded, several verses which M. Hermann is disposed to correct, will not stand in need of the remedy which he offers; for instance, Hymn. in Merc. 446,

τις τεχνη, τις μυστα αμυχανων μελεδωνων,
of which the following correction is proposed,

τις δ' η μυσ' ηδ' εστιν, &c.

As, in the former case, subsequent writers have admitted the hiatus principally in forms borrowed from Homer, the most recent poets have rejected it altogether.

IV. With respect to the influence of a mute and liquid on a preceding vowel, in rendering the syllable long, the practice of the earliest and latest writers seems nearly to have coincided. The versifiers of some of the intervening ages, particularly Quintus Calaber, and others who appear to be nearly his contemporaries, frequently make the vowel, preceding the combination of such letters, short, while Nonnus rigorously adopted the ancient usage. In Orpheus the instances of this licence are remarkably numerous, a circumstance which may have some weight in determining his age.

These observations are greatly dilated by our author, and applied to a vast variety of instances extracted from the works of the poets, and interspersed with various incidental remarks, relative to the versification of the epic writers. The conclusion derived from the whole is, that the author of the argonautics has adopted that style of versification, which was prevalent a few centuries after the christian æra, and which preceded the age of Nonnus.

His diction is the next subject of examination. The following observations are ingenious: "Antiquorum propria sunt in primis hæc duo, simplicitas orationis etiam in summo ornatu; grandis autem, elata, metaphoris splendens dictio, non nisi in re actiosa et plena commotionis animorum, qualis quidem dictio ab epici carminis natura abhorret. Contra, recentem ætatem, corruptumque venustatis sensum, arguit oratio molesta, quæ sita, omnino gravior quam pro rei tractatæ conditione. Multo autem recentioris magisque corruptæ æta-

is indicium ea dictio est, in qua qui est ornatus, vim suam et virtutem nimio usu jam amisisse intelligitur. Cognoscitur hoc ita, si scriptor, præsertim, alienus a vano ornatu, exquisitas verborum formulae ibi adhibet, ubi non voluit ornare orationem; ubi autem grandiore dictione opus est, is abstinet. Ut exemplo rem illustrem, molesta dictione usi sunt Callimachus, Nicander, Lycophron, sed perpetuo, ut pateat gratiam hinc scriptis suis quævisse. Multo post idem fecit Nonnus. Hic, pariter atque illi, habuit imitatorum suos, qui, quæ isti multo usu vulgaris reddiderant, pro vulgatis adsciverunt. Quo fieri non potest quin seniores ætate se esse prodant. Sic igitur etiam Orpheus. Hic minime sæculo præditus ingenio, quum brevitatē et simplicitatem magis necessitate quam consilio consecraretur, multa tamen habet, quæ quia altius assurgere videntur, ita sunt ab hujus oratione aliena, ut manifestum sit, is temporibus scripta esse, quibus jam erant vulgaris.

—p. 772.

The use of the pronoun *ôi*, necessarily occupies a conspicuous place in a dissertation on the language of Orpheus. The metrical power of this word, with its accusative *ê*, is also treated more largely and accurately than we remember to have seen it elsewhere considered. The passages of the ancient writers, which violate the metrical canon on this subject, are copiously investigated, and emendations proposed, of the truth of many of which we entertain no doubt; but our limits will not permit us to enlarge. The grammatical employment of the word *ôi* by our poet is most singular. It seems, on various occasions, to answer to almost every case, person, and number, and frequently to be used as a mere expletive. Its various employments are diligently enumerated by M. Hermann, but he should not have quoted his own corrections as examples of his rules. Vestiges of a similar usage are found in Quintus Calaber, whence it is inferred that the pseudo Orpheus

flourished subsequently to the age of that poet, Quintus being considered as the prototype, as deviating less from ancient and established custom.

On the whole, much learning and ingenuity are manifested in this dissertation; and though none of the arguments separately taken are sufficient to determine the point in question, yet, by a complication of probabilities, M. Hermann seems to have succeeded in evincing the truth of his position, that the unknown author of the argonautics flourished in a late period of Greek poetry, probably subsequent to Quintus Calaber, but almost certainly prior to the age of Nonnus.

Among the addenda to the lithics, are some various readings from Tzetzes, one of which would have deserved insertion in the text, had the editor been earlier acquainted with it; v. 11. *τῶν τε* for *τῶν τε*. M. Hermann, on this occasion, finds reason to condemn his own conjecture, which he has inserted in the text, supplying a proof of the injudiciousness of the hasty reception of an emendation, though not improbable, which the first inspection of a valuable copy may immediately overthrow.

Among the Harleian MSS. is preserved a copy of the argonautics, the collation of which does not appear to have been yet communicated to the public. Though not a MS. of very ancient date, it appears to have been taken from a valuable original, the readings which it supplies being commonly coincident with those of the MSS. of Vossius, Vienna, and Ruhnkenius. It frequently possesses the expletive *ôi* where it is obliterated in the common copies. One reading it furnishes, which, though very obvious, has not appeared in any printed edition till the present, in which it is inserted from the conjecture of Gesner in the index, and which does not seem to exist in any of the collated copies, *ἐνοργάνων* for *ἐνοργάνων*, v. 317, ed. Herm.

ART. II.—*Comicorum Græcorum Fragmenta quædam. Curavit et Notas addidit ROBERTUS WALPOLE, A. B. Trin. Coll. Camb. 8vo. pp. 116.*

THE remains of ancient literature, though comprizing, without doubt, many of the most valuable productions of the best ages of Greece and Rome, yet form but a wreck of the vast collection of their taste and science. The mere catalogue of authors whose names only remain, of works whose titles alone have survived

the injuries of time, which doubtless bear but a small proportion to those of which the very memory has irretrievably perished, would perhaps form a volume of no inconsiderable bulk. To collect an extensive library was indeed a work of royal magnificence; but we may justly be inclined to wonder, considering the disad-

advantages resulting from the difficulty of multiplying copies, and the obstacles and discouragement which this circumstance must have caused to literary exertion, that the formation of large libraries, and much more of those immense repositories of books whose existence is recorded, should have been within the limits of possibility.

The works of the extant writers have, however, preserved to us considerable fragments of many of those which are lost; the collection of which, arranged under their several heads, though a difficult, would be a very meritorious service to the cause of literature. Such a project Bentley is said at one time to have entertained; and a monument of his skill and diligence is extant in the fragments of Callimachus, which he has explored, though not without leaving some gleanings to the care of succeeding critics. In no department, however, have the scattered relics of learning more employed the attention of scholars than in that of the drama. This species of composition among the Greeks is peculiarly interesting: partly from its intrinsic merit, and the specimens which it affords of that Attic elegance which has been the admiration of all ages; and partly because we are able to trace it with greater exactness than most of the other established forms of writing, from its rude origin through its various stages of progress to the ultimate perfection which it acquired. It is computed that in the age of Alexander about three thousand dramatic pieces of various descriptions were extant, of which some kind of memorial remains. It is to be regretted, that of the comic writers, Aristophanes is the only author of whom any entire work is preserved. The fragments however of Menander and Phileton, lamentable relics as they are of departed fame and genius, still amount, with their due proportion of commentary, to a considerable volume. The names of the most eminent comic writers of Greece have been rendered familiar to English readers by Mr. Cumberland, in the interesting sketch of their works which he has given in the *Observer*; and his own masterly translations convey no inadequate representation of the elegance of their remains.

Some of the most interesting fragments of the comedians, selected by the

taste, and illustrated by the learning, of Mr. Walpole, are comprized in the little volume which forms the subject of this article. The authors are Cratinus, Eupolis, Plato, Pherecrates, Alexis, Antiphanes, Anaxandrides, Aristophon, Ehippus, Epicrates, Eubulus, Phœnices, Philetærus, Timocles, Mnesimachus, Xenarchus, Macho, Theophilus, Menander, Philemon, Diphilus. These fragments are elegantly printed, and we believe more correct in their readings than they have hitherto appeared. We wish that to each article Mr. Walpole had annexed the name of the author in whom it is to be found.

Peculiar value will be attached to this volume, in consequence of some emendations which it contains from the masterly hand of professor Porson, some of which we shall transcribe. In a fragment of the *Assentatores* of Eupolis, for *σκαμμα γαρ ειπας ελεγε*, is read, *σκαμμα γαρ ειπ' ασελγες*, an emendation which may be classed with that of Alexander Aetolus, by Casaubon, celebrated by Valckenar (*Dietr.* 279). A humorous fragment of Epicrates (p. 18) has the benefit of the same criticism both in the reading and the metre. P. 99, we have the following note; which contains the first application of the celebrated MS. of Plato, recently brought to this country, to the purposes of criticism, that we remember to have seen; we wish that it might be speedily followed by many similar instances. 'Philetaeri, Venatrice. Quicunque accurate Suidam in vocibus *Φιλεταερος* et *Νικοστρατος* lectitaverit, is liquido dejerare posset ista duo nomina ad unam eandemque personam respicere. Hanc Porsoni conjecturam extra omnem dubitationis aleam ponit scholion quantivis pretii, quod, literis præ vetustate obtutum oculorum pane fugientibus, ex MS. Platonis Dialogorum nobiscum perbenigne communicavit vir eruditissimus, p. 47. For *πορ ταυτα, καν εκατη στη βιωσεται*, the corrupt reading of a verse of Menander, we have the following emendation—*στη βιωῃς ετι*, an improvement on that of Toup, and doubtless the genuine reading.

Translations of many of the fragments from Grotius and Cumberland are added. The whole is creditable to the taste and industry of Mr. Walpole, and we hope that it is the precursor of future exertions.

ART. III.—*Specimens of scarce Translations of the seventeenth Century from the Latin Poets. To which are added miscellaneous Translations from the Greek, Spanish, Italian, &c.* By ROBERT WALPOLE, Esq. B. A. of Trinity College, Cambridge. 12mo. pp. 164.

OUR early English translators have long laboured under the imputation of that servile fidelity, which is true indeed only to the words of the author, while his spirit

is suffered wholly to evaporate, and leaves behind little more than a lifeless form. Yet a few there are, whom even the severest censurer will except from this accusation. It is the object of Mr. Walpole, by the specimens collected in this volume, to give his readers a more favourable idea than is usually formed of several of our early writers, "in this species of composition, with whose productions the general mass of readers is but little acquainted, from the rarity of the books in which they are contained." The best perhaps is that from Gallus by Cotton, but we are doubtful whether any of them merit revival from the oblivion into which they have sunk. They certainly do not in every instance correspond to the former part of the panegyric of Mr. Walpole, that "fidelity has been scarcely ever sacrificed to paraphrase, and in many passages peculiar felicity has been displayed by them." The latter of the following lines is audaciously inserted by Oldham in his translation of the story of Byblis and Caunus.

"Alive I'll press, till breath in pray'rs be lost,
And after come, a kind beseeching ghost."

P. 33.

He thus amplifies three lines of the original:

"Dixit, et (incertæ tanta est discordia
mentis)
Cum pigeat tentasse, libet tentare; modum-
que
Exit, et infelix committit sæpe repelli."

"She spoke: but such is her unsettled mind,
It shifts from thought to thought like veering
wind,

Now to this point, and now to that inclin'd,
What she could wish had unattempted been,
She strait is eager to attempt again;

What she repents, she acts; and now lets
loose

The reins to love, nor any bound allows;
Repulse upon repulse unmov'd she bears,
And still sues on, while she her suit despairs."

P. 35.

We know not what specimen we can select with greater propriety, than part of the story of Lucretia from Ovid, by Creech.

"This art prevail'd; she fear'd an injur'd
name,
And liv'd and suffered to secure her fame.
Why dost thou smile, triumphant ravisher?
This shameful victory shall cost thee dear;
Thy ruin pay for this thy forc'd delight:
How great a price! a kingdom for a night!

"The guilty night was gone;—the day ap-
pears;

She blusht and rose, and double mourning
wears;

As for her only son, she sits in tears,
And for her father and her husband sends.
Each quickly hears the message, and attends.
But when they came and saw her drown'd in
tears,

Amaz'd they ask'd the cause,—What violent
fears,

What real ill did wound her tender mind?
What friend was dead, for whom this grief
design'd?

But she sat silent still, still sadly cried,
And hid her blushing face, and wept and
sigh'd.

Both strive to comfort, both lament her fate,
And fear some deadly ill they know not what:
Thrice she would speak, thrice stopp'd; again
she tries,

To speak her wrong, yet durst not raise her
eyes:

'This too on Tarquin's score,' she cried, 'I
place;

I'll speak, I'll speak, ah me! my own dis-
grace;—'

And what they could her modest words ex-
press;

The last remain'd, her blushes spoke the rest.
Both weep, and both the forc'd offence for-
give:

'In vain you pardon me, I can't receive
The pity you bestow: nor can I live.'
This said, her fatal dagger pierc'd her side,
And at her father's feet she fell and died."

Several French translations from the Latin poets are also contained in this collection.

The second part of this volume is entitled Miscellaneous Translations, containing versions in Greek, Latin, and English, from originals in Spanish, Portuguese, Italian, French, Greek, and Latin. Two Greek poems are original: an epitaph on Mr. Tweddell, who died at Athens; and an ode, honoured with a prize, on the surrender of Malta to the English arms. The former of these poems, as it is short, we may be permitted to transcribe.

"Ευδεις ἐν φθιμένοισι μάτην Σοφίης αἶψ' ἐ-
ρέψας

"Ἀνδρα, καὶ σὰ νέον Μιῦσ' ἐπιλήσας μάτην.
'Αλλὰ μόνον τὸ γὰρ σῶμα τὸ γῆινον αἰμι-
καλύπτει

Τίμωρος ὁδὲ ψυχὴν οὐρανὸς αἰεὶς ἔχει.
'Ἡμιν δ' οἱ σὲ φίλοι φίλον ὡς, κατὰ δάκρυ

χέοντες
Μναμα φιλοφροσύνας χλωρὸν, οὐδ' οὐμθα,
'Ἢδ' ὧ ὅμως καὶ τερπνὸν ἔχειν τοῦτ' ἐστίν,
'Ἀθηνων

'Ὅς σὺ Βρεττανίος ἔων κείσαι ἐν ἀντιόχῳ."

- His Greek compositions prove Mr. Walpole to be well versed in the works of the lyric and dramatic writers. The use of the tenses is not always nicely accurate. The following line contains an Anglicism:

"Cum mortis almus composuit sopor."

The sense requires, though the metre will not admit, composuerit: *ευωχρεῖς* (p. 133) would be more accurately *ευωχρη*. The optative following *πριν* has a different power.

The translations from the Greek are mostly of amatory poems. The following specimen is among the best:

"Fraught with the nectar'd sweets of early spring,
Mark where the Zephyr speeds his destin'd way,

And seeks upborne aloft on balmy wing
Each flower that glitters in the morning's
ray.
Onward he hastes; and views with glad delight,
Where gemm'd with dew the blushing rosea bloom;
There ling'ring checks awhile his eager flight,
And sighing o'er inhales the soft perfume.
Still as he flies, the fragrance which he sips
He breathes around, and scatters through the air,
Till fix'd at length he rests on Julia's lips,
And, mingling with each tender accent there,
Sighs with the sigh which from her bosom flows,
And scents with balmy dew the kisses she bestows."

ART. IV.—*A Compendious Dictionary of the Latin Tongue: for the Use of public Seminaries, and of private Students.* By ALEXANDER ADAM, LL. D. Rector of the High School of Edinburgh. 8vo. pp. 911.

THE writer of this work is well known to the public as the author of several eminently useful performances tending to facilitate the acquisition of classical learning; and in common with his former publications, the present volume bears ample testimony to his accurate erudition. In many respects it certainly possesses a decided advantage above every similar work intended for the use of the English learner. The examples have been selected with great care, and commonly present the most striking passages, or those which most require illustration, in the authors from whom the words are taken.

"In order to connect the knowledge of words and things together, whenever a beautiful moral sentiment occurred, or an allusion is made to a remarkable custom, to an historical fact, or the like, the whole sentence is transcribed, and if difficult, explained. When the example refers to any thing of great importance, it is farther illustrated by quoting similar passages from various authors. On this part of the work the compiler has bestowed the utmost attention, and hopes it will be found useful to readers of every description. Any one, who takes the trouble of examining only a few of the words, on which he has enlarged, and of comparing them with those in Ainsworth, or indeed in any other dictionary the compiler has met with, will perceive the pains he has taken, and how much still remains to be done, to facilitate the perusal of the Latin classic authors."

It is no unimportant advantage, that for the authorities quoted, the best editions, as those of Ernesti, Gesner, Dra-

kenborch, &c. have been commonly consulted. The typography also, an essential circumstance, though till lately much neglected, in a work intended for the use of young persons, has been carefully superintended.

The authorities to which Dr. Adam acknowledges himself principally indebted, are Cooper and Ainsworth, Gesner's edition of the Latin thesaurus of R. Stephanus, Facciolati, the indices of Burman, Ernesti, &c.

It is mentioned that a few names of gems, plants, and insects, which rarely occur, are omitted. This we regret; as they are few, the insertion of them would not have sensibly increased the bulk of the volume.

In one respect this work appears under a disadvantageous form. The former part of it is an abridgment of a larger work; while in the latter part the articles are inserted without curtailment, and consequently appear on a much larger scale. The circumstance is thus accounted for. The author, being prevented from executing the design of publishing his larger work by the high price of printing and paper, resolved in the mean time to publish an abridgment for the use of learners; intermingling, for the service of more advanced students, a fuller explication of such words as appeared most important or difficult; but perceiving as he proceeded, the utility of more copious illustrations, he afterwards introduced them more freely, and in the latter part of the book has

enlarged on every word in proportion, to its importance, on several of them, nearly as much as he proposed in his larger work.

Derivatives, and compound words, except in the case of words compounded with prepositions, are commonly inserted under their respective radicals. We doubt whether this method, though more satisfactory to the advanced student, be so well adapted for the use of the very young scholar, who has difficulties enough to contend with in the acquisition of a complex language. But we suppose that this dic-

tionary is only intended for the use of those who have made some proficiency beyond the elements of the Latin tongue.

We gladly avail ourselves of this opportunity of expressing our sense of the useful and meritorious labours of Dr. Adams in his preceding publications; along with our hope, that the success of the present volume will be such as to justify him in shortly communicating to the public the larger work of which it may be considered as a specimen.

ART. V.—*Greek Exercises, in Syntax, Ellipsis, Dialects, Prosody, and Metaphrasis: to which is prefixed a concise, but comprehensive Syntax. By the Reverend WILLIAM NEILSON.* 8vo. pp. 162.

THE practice of exercises, though familiar in the Latin, and of great importance in the acquisition of any language, has been strangely neglected in the Greek, at least till the publication of Dr. Huntingford's useful work. The motives which have induced the publication of the present volume, after the appearance of that of Dr. Huntingford's, are not explained. Perhaps the latter has not been much used in Ireland. We shall not enter into a comparison of the two works. Each possesses its advantages. That of Mr. Neilson, from the greater minuteness and variety of the rules, and less complexity of the sentences, is perhaps better adapted for the use of *young* scholars. It possesses also some important additions. The following extract from the preface of the author will sufficiently explain his plan; it is only our duty to add that it has been carefully and successfully executed.

"The sentences are all, except in one or two unavoidable instances, in Attic prose; for it is evidently improper to distract the learner's attention from syntax, to poetic licenses, or variety of dialects.

"Each chapter is divided into three parts. The first contains plain sentences, rarely anticipating any subsequent rule; these ought to be all rendered into correct Greek, before the other parts of the chapters are attempted. The second contains more variety of expression, and exemplifies the rules promiscuously, as well as the particular one prefixed to each chapter: this part is from ¶ to the end of the English sentences. Having finished these sentences, in all the chapters on syntax, the student will be able to trans-

late the third part of each chapter, which consists of Latin sentences, with no corresponding Greek.

"As there are many elliptical expressions, which cannot be comprehended under any general rules of syntax, a selection of the most important examples has been made from Bos's excellent work on ellipsis. The scholar is to supply the words omitted; which he will do with ease and pleasure, being enabled, by the translation, to find them, and directed, by the blank spaces in the Greek page, where they ought to be placed. The Latin language was preferred to English, in these, in the sentences to be translated at the end of each chapter, and in the chapter on metaphrasis, as we have no English-Greek lexicon.

"In order to give a knowledge of the different dialects, quotations from Ionic, Doric, and Æolic writers, and Homer, are inserted, which are to be rendered into the common Attic Greek. The student will thus learn every thing of importance in each, with much more ease and pleasure, than by committing a number of rules to memory.

"The lines reduced to prosaic order, and to be returned into metre, are intended to form a taste for the melody of Greek poetry. And, to impress upon the mind the distinction between a poetic and prosaic style, it is recommended to exercise learners in paraphrasing, or imitating in prose, select passages of the Greek poets. This is usually called metaphrasis. A short specimen of it is given in the last chapter. It was thought unnecessary to insert more pieces of this kind, as any poet will furnish sufficient exercises."

The rule prefixed to chap. vii. on the use of the particles *av*, *av*, &c. is not sufficiently accurate and distinct.

ART. VI.—*The Nature of Things: a Didactic Poem. Translated from the Latin of Titus Lucretius Carus, accompanied with the original Text, and illustrated with Notes philological and explanatory. By JOHN MASON GOOD. In Two Volumes. 4to.*

SEVERAL causes seem to have conspired to withdraw from the poem of Lu-

cretius, that degree of popularity and esteem to which it is justly entitled, and

which it has always enjoyed with a few discriminating men of letters. The abstruseness of its subjects; the irreligion and licentiousness which have been attributed, the former perhaps justly, the latter certainly with great injustice, to the tenets of Epicurus; have operated to its prejudice; nor is it every reader on whom the simplicity, and in some passages ruggedness of the style, will not at first operate unfavourably. On the other hand, the skill with which the argument is treated, but more especially the exquisite pictures and descriptions, the frequent strokes of sublimity and pathos with which the subject is varied and adorned, will ever secure for this poet a high degree of estimation with readers of real taste, and justly place him in the foremost rank of Roman genius.

Though the circumstances which have been mentioned have almost necessarily precluded this writer from the enjoyment of extensive popularity, yet many modern writers and readers of taste have been no strangers to his merits, and there are few authors of whom imitations may more frequently be traced in the works of succeeding poets. Thus our own Spenser, a writer indeed intimately conversant with the great performances of antiquity, has almost translated the introduction of the poem in a long passage, which does ample justice to the original. The modern literature of the most polished nations of Europe, and that of our own country in particular, possesses also various translations of this writer, though in few instances capable of affording any adequate representation of his beauties. That of Marchetti perhaps alone presents an exception to this remark. The French, as usual, appear to have naturalized the poet only by means of prose translations; and the versions, whether partial or entire, which our own country has afforded, have in most instances been long and deservedly disregarded.

It has been the fate of this poet to have suffered in the original almost as much from the licentiousness of his editors, as, in modern languages, from the inadequacy of his translations. The publication of a splendid edition of the Latin text in this country by Mr. Wakefield, in which many passages have been restored to a state of integrity, by the aid of manuscripts and old editions, in consequence of which the attention of the public has perhaps been directed in a greater degree to the work of this poet, seemed to offer a favourable

period for a translation, of merit commensurate to the claims of English literature, and the just reputation of the author. This office has been undertaken by Mr. Good; honourably, we think, to himself, and beneficially to the cause of learning.

The elegant poetical talents, and the various learning of Mr. Good, are already well known to the public; and these are qualities which it is requisite for a translation of Lucretius to combine in no ordinary degree.

The preface contains, at considerable length, an account of preceding versions which have come to the knowledge of the translator, as well as of the views with which his own translation was undertaken, and the principles upon which it has been conducted. On this subject the writer may properly speak for himself.

“Contrary to the example afforded by my predecessors, I have preferred blank verse to rhyme; not, however, from any dread of superior labour, but from a persuasion that, in mixed subjects of description and scientific precept, it possesses a decisive advantage over the couplet. It lends more readiness to the topics introduced, it exhibits more dignity from its unshackled freedom, and displays more harmony from its greater variety of cadence. I have also attempted, what ought, indeed, to be the attempt of every translator, to give the manner, as well as the matter, of the original, to catch its characteristic style, and delineate its terms of expression.

“The translation is accompanied with a perpetual commentary, in the form of subjoined notes, and a correct copy of the Latin text. With respect to the propriety or advantage of the latter, I was for some time doubtful. Mr. Wakefield was the first who proposed it to me; the plan was afterwards strenuously advised by many other literary friends of the first eminence, and I at length resolved to adopt it. In the choice of an edition, I found no difficulty: the intrinsic excellence, and pre-eminence of Mr. Wakefield's own, precluding all hesitation upon the subject. I have at present, however, a motive for reprinting this edition, of which, I could not, at first, be aware; for almost all its copies were unfortunately consumed by the fire that, about two years ago, destroyed Mr. Hamilton's printing-offices. To this edition, nevertheless, I have not, in every instance, adhered in my translation; on some few occasions preferring the lection of prior expositors, and in two or three cases suggesting emendations of my own: yet, not choosing to break in upon the integrity of Mr. Wakefield's text, I have merely pointed out, and defended, such variations in the commentary.

"This commentary is composed of notes of different descriptions, which will, in general, be found equally original in their design and materials. It consists of parallel passages, or obvious imitations of Lucretius by other poets, whether Latin, French, Italian, German, Spanish, Portuguese, or English; together with original passages from Greek writers, to which our poet has himself occasionally referred, or from which he has manifestly borrowed. It consists, likewise, of casual observations on the different versions of Lucretius in our own, as well as foreign languages; and comparisons of the doctrines elucidated or animadverted upon in the course of the poem, with others of a similar tendency, which have been advanced or maintained by more modern philosophers. As I chiefly design this publication for the use of the English reader, I have, moreover, been punctilious in subfixing translations of all the passages from foreign writers, whose works I have found it necessary to quote. In cases where we have already adequate translations of such works in our own language, I have readily availed myself of such assistance: but in all other instances, as also where the version in common use is not sufficiently close to the original author to answer the purpose of the quotation, I have taken the liberty of giving a version myself. This, as will be obvious, has largely augmented my labours, but it was a trouble that seemed imperiously demanded."

Mr. Good however has not confined his researches to the writers of ancient or modern Europe: he is an oriental scholar, of no mean accomplishment; and has in various instances rendered the muses of the east, tributary to those of the west. From some instances of coincidence, he is not indeed uninclined to concede some probability to a supposition of the abbé de St. Pierre, which he allows to be only a conjecture, that Lucretius was not ignorant of the poetic books of the Jewish scriptures. Virgil, he observes, was indisputably acquainted with the prophecies of Isaiah. We cannot say that the coincidences which are supposed to exist between some passages of the poet, and the writings of the prophet, appear to us sufficient to establish the fact. Had the literati of Greece and Rome been acquainted with the Jewish scriptures more than by reputation, the references to them, and the mention made of them, would, we conceive, have been more frequent.

The preface is followed by a life of Lucretius. The materials are indeed scanty: they appear however to have been gleaned with great industry by the biographer. Lucretius appears not to have possessed any public station. It is not therefore surprising that the incidents of his life oc-

cupy a small space in the annals of Roman history. How little is indeed known of the lives of Virgil and Horace beyond what is incidentally recorded by themselves, or a few of their contemporaries similar to themselves in taste and pursuits! The name of Lucretius is traced in various periods of Roman history from the expulsion of the Tarquins. But though several persons occur, memorable on different accounts, who bore this name, no documents remain which enable us to trace the line of the poet's descent. His work however forms a nobler and more durable monument to his fame, than any honours of lineage and ancestry by which he may have been distinguished.

Whatever were the parentage of Lucretius, as his talents were eminent, his education appears to have been the most liberal that the age was capable of affording. The polite arts, as well as the severe studies of philosophy, had now made considerable progress in Rome. At no remote period the language, manners, and literature of the Greeks, had been the object of abhorrence or contempt to the stern patriots of the republic; who held no acquisition in estimation but that of military glory, and feared no danger but the introduction of such principles, tastes, and pursuits, as tended, in their opinion, to enervate the martial spirit of their countrymen. The voice of the philosopher was regarded as the song of the syren, charming indeed, but only calculated to lull men into inactivity and effeminacy. Yet when the severe Cato could so far prevail over the inveteracy of his prejudices, as in an advanced period of his life to become a student of the Greek language, it is not suprising that the pursuits of literature, of which Greece was the only accessible source, gradually gained ground, till that native tongue of poetry and science became a necessary part of the education of every Roman youth distinguished by rank, fortune, and promising talents.

It is evident from his writings that Lucretius must have applied himself with great ardour to the acquisition of the Grecian philosophy. His poem displays almost as much learning as genius. The sect under whose banners he enrolled himself, was that of Epicurus; whose philosophy, however imperfect, when compared with that of the moderns, and however chargeable with some great and important errors, was perhaps on the whole the most rational system, at least of

physics, dialectics, and morals, which had then been introduced. The schools of this philosophy were at that time distinguished by some of the most eminent names of which the age could boast.

To explain the principles of this system in the Latin language, in the form of a didactic poem, was an undertaking at once novel and arduous. A didactic poem was perhaps a production hitherto unknown in the Latin tongue; and the prose writers, who had applied themselves to the illustration of philosophy, had altogether failed of success. Cicero treats with contempt, with respect at least to their style and arrangement, the philosophical treatises which had preceded his own writings in that branch of science. Greece indeed abounded with examples of this species of composition, which it would be a vain attempt to number, and comparatively few of which have survived the ravages of time. Some of the elder philosophers, as Empedocles and Parmenides, had also presented their systems under a poetic garb; and in a subsequent age didactic poetry had received from such writers as Nicander and Aratus, a more polished language, and appropriate tone. With respect however to the state of Roman literature, Lucretius might justly indulge the boast:

*‘Juvetque novas decerpere flores,
Insignemque meo capiti petere inde coronam,
Unde prius nulli velarint tempora Musæ.’*

The Latin language was undoubtedly much less tractable than the Greek to the employment either of the poet or philosopher. Cicero frequently complains of the difficulty of conveying philosophical ideas by means of a language not yet disciplined to the admission of terms correspondent to them, and he appears to have been frequently reduced to the necessity of inventing terms for the purpose of expressing his Greek original. Lucretius had a still greater reason to complain of the hardship of accommodating philosophical ideas at once to a language, to which they were hitherto unknown, and to the mechanical structure of verse, and laws of poetical description; a difficulty which he does not fail to point out to the friend to whom his work is inscribed.

*‘Nec me animi fallit, Graiorum obscura re-
perta
Difficile illustrare Latinis versibus esse;
Multa novis verbis præsertim quom sit a-
gendum
Propter egestatem linguæ, et rerum novita-
tem.’*

Another difficulty which Lucretius himself mentions as incident to his work, was the necessity which it imposed on him of combating the popular prejudices of his age, and the imputation of impiety to which it was likely to subject him. Yet we cannot help thinking that this difficulty is overrated by Mr. Good, when he says, ‘it is impossible to conceive that any man could, without personal danger, encounter the animosity of so numerous and powerful a body as those religious orders must have formed, by the propagation of doctrines avowedly subversive of their entire constitution.’ The hold of the pagan system of theology on the minds of men was already much relaxed in the age of Lucretius; men of education, among whom alone his poem was likely to be circulated, were commonly unbelievers in it; and many of the pontiffs who performed in public the solemnities of their religion, in private ridiculed its absurdities without reserve.

Having satisfactorily defended the doctrines of Epicurus, and the philosophic poet his disciple, from the charge of immorality and licentiousness, which has been thrown upon them by the ignorant or the disingenuous, Mr. Good next enters upon a more arduous task, that of clearing the Epicurean system from the imputation of atheism, which has in every age been affixed to it. The undertaking is bold, and ingeniously supported; we cannot say that it appears to us equally successful. Our limits permit us to extract only a small part of Mr. Good's apology.

He first shews, what indeed no one will deny, that Epicurus allowed the existence of intelligent beings superior to man in happiness and dignity of nature. In some passages Mr. Good imagines that he discovers the mention of one supreme intelligence, of incomprehensible majesty, who by his inscrutable decrees governs the universe, and regulates the tenor of events.

“This magnificent and tremendous Being he no where attempts to describe: but, to prove his existence, he adverts, in a variety of places, to those arbitrary and mysterious events which are perpetually recurring through all nature, baffling the expectations of the most prudent, and elevating us to the contemplation of a Divinity, supreme, individual, and omnipotent:

“So, from his awful shades, some POWER
UNSEEN
O’erturns all human greatness; treads to
dust

Rods, ensigns, crowns, the proudest pomps
of state,
And laughs at all the mockery of man.

"The *unseen, incomprehensible, or mysterious* POWER, is a phrase not unfrequently applied to the Divinity in most languages, but in none, perhaps, with so much appropriation as the Latin, in which the term *Vis*, or *POWER*, even without an adjunct, is put in apposition with *Numen*, *MENS DIVINA*, or the *PRESENT GOD*, and often used synonymously for these appellations. Thus the author of the Panegyric to Constantine Augustus: 'O supreme Creator! whose names are as numerous as thou hast willed there should be languages among the nations: whom, for thou authorisest it to be said, *it is impossible for us to know*—dwells not in thee that *CERTAIN POWER*, and *DIVINE MIND*, which is diffused through the whole world?' The writer has selected the very words of Lucretius, *VIS QUEDAM*, but has, at the same time, omitted his truly elegant and appropriate epithet of *abditæ*, *unseen, inscrutable, or mysterious*:—*VIS ABDITA QUEDAM*. Cicero, in his Milonian oration, has a passage still more to the point: 'Nor can any one,' says he, 'think otherwise, unless he disbelieve that there exists a *POWER* or *DIVINE ENERGY*. But there does, there does exist this *POWER*; nor is it possible that a *SOMETHING*, which perceives and actuates, should be present in these bodies, even in the midst of their infirmities, and not be present in so grand, so excellent a movement of nature: unless, indeed, such a *POWER* be to be denied for the sole reason that it is *not seen, or perceived*; as though we were able to behold this mind of ours by which we determine, by which we foresee, by which, at this moment, I myself act, and speak, or could plainly ascertain of what it consists, or where it resides. This, this, then, is the *POWER* that has so often favoured this city with an incredible prosperity and happiness.' Let not, therefore, the theism of Lucretius be suspected, because, in conjunction with his countrymen in general, he represents the great author and arbiter of all things as an *UNSEEN* or *INSCRUTABLE POWER*. Even in the present age of the world, we only know him from his attributes,—from his word and from his works, for no man *hath hitherto seen God, or can see him*. The sacred scriptures are full of the same representation. Thus, Moses, in the very midst of an intercourse with which he was favoured by the Almighty, inquires what is his *name*, that he might inform the Israelites of it. To the same effect, Zophar, in his interview with Job:

"Canst thou by searching find out God?
Canst thou completely find out the Almighty?"

"With which, the following sublime apostrophe of Job himself is in perfect unison:

"O that I knew where I might find him:—
Behold! I go forwards, but he is not there;
And backwards, but I cannot perceive him:

On the left hand I feel for him, but trace him
not,
He enshroudeth the right hand, and I cannot
see him.

"So the devout Asaph:

"In the sea is thy way,
And thy path in the deep waters,
And thy footsteps are not known.

"And hence the Athenians in future ages, erected an altar to this same inscrutable and *MYSTERIOUS POWER*, and inscribed it ΑΤΗΛΕΤΟ ΘΕΟ, "TO THE UNKNOWN GOD." St. Paul remarked the inscription in his visit to this city, and particularly alludes to it in his address to the Athenians: 'whom, therefore,' says he, 'ye ignorantly worship, him declare I unto you.' It was about a century before St. Paul's visit to Athens, that Lucretius was studying in the same seat of philosophy and superstition: and, as there can be little doubt that this altar was at that time in existence, it is no extravagant conjecture that our poet himself had repeatedly noticed it, and had its inscription in his recollection when composing the passage before us."

The passage on which Mr. Good lays this stress, runs thus in the original:

"Usque adeo res humanas vis-abditæ quæ-
dam
Obferit; et pulchros fasces, scevasque se-
cures,
Proculcare, ac ludibrio sibi habere videtur."
V. 1232.

"We imagine that few readers of Lucretius will discover in this description any thing more than the power of chance, to use popular language, or, speaking more strictly, the agency of causes respecting which we possess too little experience to be able to foresee their time and extent of operation.

Mr. Good next represents the atomic philosophy of Epicurus as subordinate to a system of theism, and in support of this supposition quotes a few passages from Diogenes Laertius: We can only observe that in none of these passages, or in the whole circle of the ancient Epicurean doctrine respecting first causes, does there appear to us to be any mention, direct or implied, of intelligence. It is indeed the whole scope of their system of physics, to shew that matter is formed into systems of order by the operation of powers eternally and independantly inherent in itself. In the translation of one of the passages to which we have referred, it must be observed, that the word '*immediate*,' printed in Italics, is inserted, and that the word rendered '*creation*,' implies only origination or birth, or con-

edition, if with some editions, we read
F. 5720H.

The appendix to the life contains a comparison of the Epicurean philosophy, with other ancient systems, and a history of its various revolutions in ancient and modern times.

We now proceed to the translation: and the extracts which we shall give, partly from the more strictly didactic and argumentative, and partly from the descriptive and more ornamented passages of the poem, will enable our readers to form their judgment of its merits.

The invocation to Venus, as the representative of nature, and parent of the Roman race, with which the poem commences, is a passage of celebrated beauty, and is well known to the English reader, by the translations and imitations of it, which are to be found in the works of our own poets.

"PARENT OF ROME! by gods and men be-
lo'd,

BENIGNANT VENUS! thou! the sail-clad Main,
And fruitful Earth, as round the Seasons
roll,

With Life who swellest, for 'by thee all live,
And, living, hail the cheerful light of day:—
Thee, Goddess, at thy glad approach, the
winds,

The tempests fly: dedalian Earth to thee
Pours forth her sweetest flow'rets: Ocean
laughs,

And the blue Heavens in cloudless splendour
deck'd.

For, when the Spring first opes her frolick
eye,

And genial Zephyrs long lock'd up respire,
Thee, Goddess, then, th' aerial birds confess,
To rapture stung through every shiv'ring
plume:

Thee, the wild herds; hence, o'er the joyous
glebe

Bounding at large; or, with undaunted chest,
Stemming the torrent tides. Through all
that lives

So, by thy charms, thy blandishments o'er-
power'd,

Springs the warm wish thy footsteps to pur-
sue:

Till through the seas, the mountains, and the
floods,

The verdant meads, and woodlands fill'd with
song,

Spurr'd by desire each palpitating tribe
Hastes, at thy shrine, to plant the future
race.

Since, then, with universal sway thou
rul'st,

And thou alone; nor aught without thee
springs,

Aught gay or lovely; thee I woo to guide
Aright my flowing song, that aims to paint

ANX. REV. VOL. IV.

TO MEMMIUS' view the ESSENCES OF
THINGS:

MEMMIUS, my friend, by thee, from earliest
youth,

O Goddess! led, and train'd to every grace.
Then, O, vouchsafe thy favour, power di-
vine!

And with immortal eloquence inspire.

Quell, too, the fury of the hostile world,
And lull to peace; that all the strain may
hear.

For peace is thine: on thy soft bosom he,
The warlike field who sways, almighty MARS,
Struck by triumphant Love's eternal wound,
Reclines full frequent: with uplifted gaze

On thee he feeds his longing, ling'ring eyes,
And all his soul hangs quivering from thy
lips.

O! while thine arms in fond embraces clasp
His panting members, sov'reign of the heart!
Ope thy bland voice, and intercede for Rome.
For, while th' unsheathed sword is brandish'd,
vain

And all unequal is the poet's song;
And vain th' attempt to claim his patron's
ear."

If we be not mistaken, this passage will be considered as a favourable specimen of Mr. Good's talents as a translator of Lucretius. The original, as we have before mentioned, has been imitated by Spenser; it was also translated by Dryden.

This introduction, beautiful as it confessedly is, presents, at first view, a kind of incongruity with the object of the work, which is to account for the nature of things by the operation of their own laws, and consequently to disprove the popular system of mythology. A poet is not to be bound by laws so strict; and when he takes advantage of the mythology of his country, as the foundation of some beautiful poetical description, he is not necessarily to be considered as subscribing to the creed which he adopts. The objection has, however, been urged by several writers, and especially by Hume. 'Lucretius,' he says, 'was plainly seduced by the strong appearance of allegory which is observable in the pagan fictions. He first addresses himself to Venus, as to that power, which animates, renews, and beautifies the universe; but is soon betrayed by the mythology into incoherencies, while he prays to that allegorical personage to appease the furies of her lover, Mars; an idea not drawn from allegory, but from the popular religion, and which Lucretius, as an epicurean, could not consistently admit of.' Effectually to defend the poet, some writers have contended that the whole description is allegorical,

and in support of this supposition, the baron des Coutures advances an abstruse philosophical hypothesis, too remote however to permit us to conceive that it entered into the mind of the author. The solution which Mr. Good proposes, though perhaps not necessary, is however much more obvious and probable.

"Now, allowing that the solution of De Coutures is somewhat too recondite, I can by no means perceive the incoherency complained of by Mr. Hume. The character of Mars is, in the present instance, altogether as allegoric as that of Venus; and the fiction of their union as correct and consistent with the true spirit of allegory, as any fiction that was ever invented. Venus is the poetic type of all female grace and excellence: Mars, of all the qualities of the hero: the one the goddess of beauty; the other the genius of war. What is there then incoherent in the loves of such ideal personages; in their mutual embraces; and the triumph of the former over the latter? The same fact is realized every day in the natural world. It is the very type of the connexion between Alexander and Thais, Marc Antony and Cleopatra, our own Edward and Eleonora. That such an allegory was consonant with the mythology of the Grecian people, is creditable to the consistency of that mythology itself. But, surely, Lucretius was not to relinquish a beauty of this description, merely because it coincided with the popular faith of his countrymen, or might even be founded upon it. In my mind, it was an additional motive for his having recourse to it; and nothing can, in a greater degree, demonstrate the delicacy of his taste, or the correctness of his judgment.

"It is true, he is commencing a poetical essay, with the express purpose of confuting the popular mythology of both Greece and Rome. He asserts repeatedly that the whole system is fictitious, and totally unworthy of credit; but he asserts at the same time, that so long as it is regarded as mere fiction, no evil can ensue, and that its beauties are numerous and apposite:

"Call, if thou chuse it, the resounding deep
NEPTUNE, and CERES term the golden
grain,
Be BACCHUS wine, its vulgar source forgot,
And e'en this globe of senseless EARTH de-
fine
PARENT OF GODS: no harm ensues; but
mark,
'Tis fiction all, by vital facts disprov'd."

Few passages have been more frequently or more justly applauded than the fine personification of superstition, which the poet employs in defence of his own philosophy. We are tempted, in this instance, to quote the original:

"Humana ante oculos sede quoniam vincti
ceret
In terris, obpressa gravi sub Religione,
Quæ caput a celi regionibus ostendebat,
Horribili super adspectu mortalibus instans;
Primum Graius homo mortaleis adules
contra
Est oculos ausus, primusque obistere coacti
Quem neque fana deum, nec fulmina, mi-
nimitanti
Murmure, compressit caecum; sed coacti
acrem
Irritat animi virtutem, estringere ut ait
Naturæ primus portarum claustra capiet.
Ergo vivida vis animi pervicit, et extra
Processit longe flammantia membra mundi
Atque omne immensum peragravit motu
animoque:
Unde refert nobis victor quid possit orire,
Quid nequeat; finita potestas denique caeli
Quânam sit ratione, atque alte tremant
hærens.
Quâ re Religio, pedibus subjecta, vicinis
Ob teritur, nos exaquat victoria caelo."

I. 63-82

"Not thus Mankind. Them long the typical
power
Of SUPERSTITION sway'd, uplifted proud
Her head to heaven, and with horrid look
Brooding o'er earth; till he, the man of
Greece,
Auspicious rose, who first the combat dar'd
And broke in twain the monster's iron rod.
No thunder him, no fell revenge pursu'd
Of heaven incens'd, or deities in arms.
Urg'd rather, hence, with more determin'd
soul,
To burst through Nature's portals, from the
crowd
With jealous caution clos'd; the flanking
walks
Of heaven to scale, and dart his dauntless
eye,
Till the vast whole beneath him stood &
play'd.
Hence taught he us, triumphant, what might
spring,
And what forbear: what powers inherent
lurk,
And where their bounds, and issues. And
hence, we,
Triumphant, too, o'er SUPERSTITION lie,
Contain her terrors, and unfold the hea-
vens."

In this passage the picture of Superstition is perhaps scarcely given with accuracy. In the original she is represented, not as lifting her head to heaven, but as residing in the skies enveloped in clouds, and displaying only her head and terrific features to the affrighted multitude beneath. The addition of the following words 'from the crowd with jealous caution closed,' rather tends also, we think, to weaken the effect of the description. For 'pursued' also, perhaps, detained

Would be more accurate. We doubt whether the additional circumstance, 'and broke in twain the monster's iron rod,' be justifiable. In other respects the translation is good.

The following passage contains one of the absurd peculiarities of epicurean doctrine, the declination of atoms. It is very accurately, skilfully, and successfully rendered by Mr. Good.

"This, too, regard intent: that primal seeds,
When down direct their potent path they
urge,
In time uncertain, and uncertain space,
Fall from the right decline—yet so minute
Vex they, no fancy less can e'er conceive.
Without this devious curve primordial seeds
Should drop successive, like the crystal show'r,
Void of all contest, all re-active blow,
Whence nature sole her world of wonders
works.

"Is, then, there be, who deem the seeds of
things
More pond'rous, as their rectilinear course
Speeds through the void, the lighter soon may
reach,
And thus the repercussive war commente,—
Far err they from the truth. For though,
when urg'd
Through the pure air, or clear translucent
wave,
Doubtless, all pond'rous forms more swift
descend;
This, from the variance of resistance sole,
Flows, by such fluids form'd, 'gainst things
unlike,
The grosser quick-o'erpow'ring. But pure
space,
In every part, in every hour the same,
Throughout resists not, the demanded path
Yielding submissive. Hence, in equal time,
Through the blank void, unequal weights
descend

Of every fancied variance: and hence, too,
The grosser ne'er the lighter urg'd below
Can gain, triumphant; or the contest rouse
Whence spring new motions, and all nature
lives.

Hence doubly flows it why the seeds of
things

Should from the right decline; yet, in de-
gree,

The least conceivably, lest we should deem
The line oblique which nature ne'er assumes.

For nought more obvious, as the sight con-
firms,

Than that all weights, their downward course
at will

Steering, obliquely never can descend;
But what keen sight of man can prove pre-
cise

That the swift cadence ne'er declines at all?
Had all one motion uniform, the new

Th' anterior skilful copying, if throughout
Primordial seeds declin'd not, rousing hence
Fresh springs of action, potent to subvert

The bonds of fate, and break the rigid chain
Of cause on cause, eternal,—whence, re-
solve,

Flows through the world this freedom of the
mind?

This power to act, though fate the deed for-
bid,

Urg'd by the will alone? The free-born mind
Acts, or forbears, spontaneous; its own time,

Its place, alike uncertain: these the will,
Doubtless, alone determines, and, at once,

Flies the fleet motion through the assenting
frame.

Dost thou not see, as down the barrier
drops

That reins the racer, instant though he dart,
Not half so instant darts he as his soul

Ambitious covets? Deep through all his
frame

Th' elastic nerves must first the wish con-
vey

Ere yet the consentaneous flight succeed.
Hence, obvious, springs all motion from the

heart,
Rous'd by the mind's resolve, and instant
urg'd

Through every nerve, through every quiv-
ring limb.

A force far different this than e'er prevails
When aught without coerces. Passive, then,

Bends all the frame th' extrinsic power be-
neath,

Borne down reluctant; till th' awakening
will

Unchains each member, and resumes her
right.

For oft, though foreign force, with tyrant
sway,

Rule us, resistless, headlong hurrying down—
Say—lurks no adverse something in the

breast
Proud to withstand? full oft, at whose con-
trol,

Swift flows the nervous tide from limb to
limb,

Bursting each bond—and, oft, as swift, re-
tires?

Hence firm maintain we primal seeds some
cause

Must feel of rising motion unbestow'd
By weight, or blow re-active, whence alone

Upsprings this secret power by man possess:
Nought forming nought, as reason proves

precise.
For weight forbids the credence that alone

Things by re-action move; yet, lest the
mind

Bend to a stern necessity within,
And, like a slave, determine but by force,—

Though urg'd by weight, in time, in place
unfixt,

Each primal atom trivial still declines."

The conclusion of the third book, a-
gainst the fear of death, is one of the
eminently beautiful passages of the
poem; our limits forbid us to extract
the whole.

"But thy dear home shall never greet thee more!

No more the best of wives!—thy babes beloved,
Whose haste half-met thee, emulous to snatch
The dulcet kiss that rous'd thy secret soul,
Again shall never hasten!—nor thine arm,
With deed heroic, guard thy country's weal!—
O mournful, mournful fate!" thy friends exclaim,

"One envious hour of these invaluable joys
Robs thee for ever!"—But they add not here,
"It robs thee, too, of all desire of joy!"
A truth, once utter'd, that the mind would free
From every dread, and trouble. "Thou art safe!

The sleep of death protects thee! and secures
From all the unnumbered woes of mortal life!
While we, alas! the sacred urn around
That holds thine ashes, shall insatiate weep,
Nor time destroy th' eternal grief we feel!"
What then has death, if death be mere repose,
And quiet only in a peaceful grave,
What has it thus to mar this life of man?

"Yet mar it does. E'en o'er the festive board,
The glass while grasping, and, with garlands crown'd,
The thoughtless maniacs oft indignant roar,
"How short the joys of wine!—e'en while we drink

Life ceases, and to-morrow ne'er returns!"
As if, in death, the worst such wretches fear'd
Were thirst unquenched, parching ev'ry nerve,
Or deem'd their passions would pursue them still.

Not anxious, thus, mankind the world resign
At evening hour when soul and body rest;
Nor would they thought that rest were ne'er to end:

Nor thus the day's desire pursues their dreams;
Though then the seeds of sense not wander far
From sensile movements, scarcely, oft, alay'd,
And quick resum'd when starts the soul at morn.

Of much less moment, then, should death be held
Than sleep, if aught can less than that which ne'er

Moment excites whatever; for the crowd
Of sensile seeds are wider here dispers'd;
Nor wakes he e'er to action, and the day,
Whose frame once feels the chilling pause of life.

"Were then the Nature of created things
To rise abrupt, and thus repining man
Address—"O mortal! whence these useless fears?

This weak, superfluous sorrow? why th' approach
Dread'st thou of death? For if the time elapse'd

Have smil'd propitious, and not all its gifts,
As though adventur'd in a leaky vase,
Been idly wasted, profitless, and vain—
Why quit'st thou not, thou fool! the feast of life

Fill'd,—and with mind all panting for repose?
But if thyself have squander'd every boon,
And of the past grown weary—why demand
More days to kill, more blessings to pervert,
Nor rather headlong hasten to thine end?
For nothing further can my powers devise
To please thee;—things for ever succeed
Unchang'd,—and would do, though revolving years

Should spare thy vigour, and thy brittle frame
Live o'er all time: e'en ampler would'st thou then

Mark how unvaried all creation moves.—
Were Nature thus to address us, could we fail
To feel the justice of her keen rebuke?
So true the picture, the advice so sage!

"But to the wretch who moans th' approach of death

With grief unmeasur'd, louder might she raise
Her voice severe—"Vile coward! dry thine eyes—

Hence with thy sniv'ling sorrows, and depart!"

Should he, moro'o'er, have past man's mid-day hour—

"What! thou lament? already who hast reap'd

An ample harvest? By desiring thus
The past once more, the present thou abhor'st,

And life flies on imperfect, unenjoyed,
And death untimely meets thee, ere thy soul,
Cloy'd with the banquet, is prepar'd to rise.
Leave, then, to others bliss thy years should shun;

Come cheerful leave it, since still leave thou must."

Justly I deem might Nature thus reprove:
For, through creation, old to young resigns,
And this from that matures; nor aught ascends

To the dread gulphs, the fancied shades of hell.

The mass material must survive entire
To feed succeeding ages, which, in turn,
Like thee shall flourish, and like thee shall die;

Nor more the present ruins than the past.
Thus things from things ascend; and, life exists

To none a freehold, but a use to all.

"Reflect, more'o'er, how less than nought to us

Weights the long portion of eternal time
Fled ere our birth: so, too, the future weighs
When death dissolves us. What of horror, then,

Dwells there in death? what gloomy, what austere?

Can there be elsewhere slumber half so sound?"

An extract from the fifth book, which forms part of the description of the progress of men towards civilization, must close our specimens of the poetical department of this work.

"Then, too, new cultures tried they, and, with joy,
Mark'd the boon earth, by ceaseless care ca-
ress'd
Each barbarous fruitage sweeten and subdue.
O loftier still, and loftier up the hills,
Prove they the woodlands daily, broad'ning
thus
The cultur'd foreground, that the sight might
trace
Leads, corn-fields; rivers, lakes, and vine-
yards gay,
Or hills and mountains thrown; while
through the dales,
He downs, the slopes, ran lavish and distinct
The purple realm of olives; as with hues
Distinct, though various, still the landscape
swells
There blooms the daisied apple, mid the tufts
Of trees diverse that blend their joyous shades.
"And from the liquid warblings of the
birds
Learn'd they their first rude notes, ere music
yet
To the rapt ear had tun'd the measur'd verse;
And Zephyr, whisp'ring through the hollow
reeds,
Taught the first swains the hollow reeds to
sound:
Hence woke they soon those tender-trem-
bling tones
Which the sweet pipe, when by the fingers
prest,
Pours o'er the hills, the vales, and woodlands
wild,
Hunts of lone shepherds, and the rural gods.
So growing time points, ceaseless, something
new,
And human skill evolves it into day.
"Thus sooth'd they every care with mu-
sic, thus,
Cloud every meal, for rests the bosom then.
And oft they threw them on the velvet grass,
Near gliding streams, by shadowy trees o'er-
arch'd,
And void of costly wealth found still the
means
To gladden life. But chief when genial spring
Led forth her laughing train, and the young
year
Painted the meads with roseate flowers pro-
fuse—
Then mirth, and wit, and wives, and frolic,
chief,
Flow'd from the heart; for then the rustic
muse
Warmest inspir'd them: then lascivious sport
Taught round their heads, their shoulders,
taught to twine
Foliage, and flowers, and garlands richly
dight;
To loose, innum'rous time their limbs to move,
And beat, with sturdy foot, maternal earth;
While many a smile and many a laughter loud,
Told all was new, and wond'rous much
esteem'd.
Thus wakeful liv'd they, cheating of its rest
The drowsy midnight; with the jocund dance

Mixing gay converse, madrigals, and strains
Run o'er the reeds with broad recumbent lip:
As, wakeful still, our revellers through night
Lead on their defter dance to time precise;
Yet cull not costlier sweets, with all their art,
Than the rude offspring earth in woodlands
bore.

"Thus what first strikes us, while ourselves
as yet
Know nought superior, every charm com-
bines,
But when aught else of ampler boast succeeds
We slight the former, every wish transferr'd.
Thus acorns soon disgusted; the coarse couch
Of herbs and leaves was banish'd, and the
hides
Of savage beasts deem'd barbarous, and un-
couth.

Yet the vast envy such these first inspir'd
Their earliest wearer by the faithless crowd
Fell, and the garb, ferocious fought for still,
Rent into tatters, perish'd void of use.

"Then man for skins contended: purple
now
And gold for ever plunge him into war;
Far slend'rer pretext! for, such skins without,
The naked throngs had dreaded every blast:
But us no ills can menace, though depriv'd
Of purple woof brocaded stiff with gold,
While humbler vests still proffer their defence.
Yet vainly, vainly toil earth's restless tribes,
With fruitless cares corroding every hour;
Untaught the lust of wishing where to bound,
And where true pleasure ceases; rend'ring
time
One joyless main, where sail they, void of
helm,
Courting for ever tumults, storms, and strife."

The choice which Mr. Good has made
of blank verse for the translation of Lu-
cretius appears to us very judicious. Se-
veral classical, didactic, and descriptive
poems in our own language, seem almost
to have consecrated this species of verse
to the use of these departments of poetry.
The greater liberty of phraseology, and
simplicity and antique cast of diction, which
it admits, peculiarly adapt it to the cha-
racter of Lucretius, and afford indeed the
only means which the English possesses
of imitating, with success, the nervous
and severe style of the philosophic poet,
which borrows no ornaments, but from
the ideas and sentiments which it conveys,
and the pictures which it represents. Re-
specting the qualifications of Mr. Good as
a translator, little is requisite to be said.
He has not only studied the work of his
author with diligence, but seems to have
availed himself of every source of infor-
mation which now remains for the illus-
tration of the philosophical tenets which
the poet inculcates. With the power of
his own language he is well acquainted,

and can apply its riches with readiness and propriety to the ornament of the subject which he treats. His poetical taste has been highly cultivated by the careful study of the best works in that branch of literature, in a great variety of languages, ancient and modern; and to erudition and taste he adds that scientific knowledge which qualifies him for becoming the interpreter of that poet, whose theme is "the nature of things."

The present version is remarkably close and faithful, being comprized in a number of verses not greatly exceeding those of the original. This advantage is in a great degree owing to the species of verse which has been adopted, nor do we recollect that it has often been purchased by any sacrifice of perspicuity, fidelity, or requisite ornament. A few instances, perhaps, occasionally occur of phraseology either incorrect or unpoetical, but they are far from being numerous. Among these we cannot but object to the use of the word *linger*, for the verb, to long :

"Could tempt them once to linger for a change."—v. 177.

Rory for dewy (v. 479), is scarcely a word of authority; roscid from the Latin adjective, would be better. "Her full-blown lamp," applied to the moon, is an expression not very perspicuous; neither do we well know why the moon is described as rushing "rampant." (v. 772) But enough respecting little blemishes, where excellence is so predominant.

The copious notes by which the translation is accompanied, form a part of the work of too much consequence to be passed over without observation. Besides their merit as illustrative of the author, they comprise a collection of facts, poetical extracts, theories, and arguments, which furnish a highly entertaining miscellany. They are, for the most part, either philological, relative to subjects of taste, and poetical diction and ornament (or as the Germans would say, æsthetic), philosophical, and mythological. One or two specimens it is incumbent on us to produce.

The following note very well illustrates that bold, but not uncommon metaphor, by which the scenes and objects of nature, when presented under their most beautiful and joyful appearances, are said to laugh.

"In the original, '*rident æquora ponti*.' Creech, as I have already noticed, has translated the verb *ridens* by the English term

smile; as have also Evelyn, Dryden, and even Guernier in his prose version. But why this more feeble term should be adopted, instead of the true and forcible synonym, *laugh*, I am at a loss to determine. Even Marchetti, of whom I have not spoken in the preface with more approbation than he merits, has failed in this bold and beautiful figure. These are his words:

"Tu rassereni i giorni foschi? e rendi
Col dolce sguardo il mar chiara e tranquilla."

"Metastasio, however, has compensated for the coldness and injustice of his countryman. He has copied this passage of Lucretius into the version I have just spoken of, and has rendered it complete and spirited:

"A te fioriscono
Gli erbosi prati
E i flutti ridono
Nel mar placati."

"To thee the fields so gay
In sweetest flow'rets blow;
Laugh the hush'd winds, and play
The placid deep below."

"Chaucer has happily imitated the same nervous metaphor, but has applied it to the sun. Cant. Knight's Tale 1495.

"And fierie Phebus rysith up so bright,
That all the orient *laughith* at the sight."

"It is the more extraordinary that Dryden, in his translation of Lucretius, should, like Creech, have employed the tamer epithet of *smile*, because, in his borrowing the above passage from Chaucer, he has very justly retained the more manly expression of both Chaucer and Lucretius. Palancon and Arctie, b. ii.

"The morning lark, the messenger of day,
Saluted, with her song, the morning gray;
And soon the sun arose with beams so bright,
That all th' horizon *laugh'd* to see the joyous sight."

"Thus, too, in the Berrathron of Ossian:
'When thou comest forth in thy mildness,
the gale of the morning is near thy course:
the sun laughs in his blue fields; the grey stream winds in its vale.'

"The same manner, Gesner, in his 'Death of Abel,' b. i. Sey uns gegrußt du liebliche sonne! du giessest farb' und anmuth durch die natur, und jede schönheit lachet verjüngt uns wieder entgegen. 'Welcome once more, thou lovely sun! thou givest colours and graces to all nature; and every beauty *laughs* with renewed youth around us.'

"But the boldest copy I have met with of this image of Lucretius, is by the Spanish poet Lope de Vega, in his *Hermosura de Angélica*, cant. xiii.

"Mueve las hojas de la selva el ripto
Y la risa del agua fugitiva,
Conciertase con ellas de tal modo
Que parece que esta cantando toda."

Now shakes the grove's green foliage to the breeze,
 With laughter shakes the stream's perpetual flight:

In harmony throughout; and earth and seas
 In songs of loud festivity unite.

"These verses have all the force of Oriental poetry, and are, perhaps, only exceeded by the following energetic and parallel passage of the Psalmist:

Let the sea shout, and all its fulness;
 The world, and all its inhabitants;
 Let the floods clap their hands,
 And the mountains unite in extacy,
 At the presence of Jehovah who approacheth."

Of the philosophical notes we have selected the following specimen, though we cannot but regard it as rather fanciful. Mr. Good's admiration of his author (an admiration which in some respects it is difficult to carry too far) has, we think, sometimes seduced him into too high an estimate of his philosophy; and led him to discover in it affinities to modern and accurate science, which exist only in the imagination of the commentator.—The note to which we allude is the following:

"And here, the first thing I shall notice is the position of Lucretius, that the body derives the whole of its elementary heat, now denominated *caloric*, univocally with his own term *calor*, from respirable, or atmospheric air. The cause of animal heat was never fully or scientifically developed, till the celebrated treatise of the late Dr. Crawford appeared on this subject, about fifteen years ago. Prior to this era, it was attempted to be accounted for in various, and indeed contradictory ways: some attributing it to the reciprocal friction of the different particles of blood; others, to their friction against the sides of their vessels: some referring it to the action of the solids of the body against the solids; others, again, to fermentations, supposed to be perpetually occurring through the whole system. But none of these solutions were satisfactory, and every one in turn yielded to the rest. The experiments, however, of Dr. Crawford, but more especially those of Lavoisier, who has perfected this theory, while they confute the conjectures hazarded by every former philosopher from Hippocrates to Cullen, establish, upon the firmest basis, the hypothesis advanced by our poet; and resolve the phenomenon of animal heat into atmospheric air, inhaled in the act of respiration, and chemically decomposed in its passage through the lungs.

"The atmosphere is a vast laboratory, in which innumerable processes of analysis, solution, precipitation, and combination, are incessantly taking place: The air itself is a confused mixture of particles ejected from

animal, vegetable, and mineral substances, and more especially from water, either entire or decomposed, through which the fluids of light, heat, and electricity, as well as an infinitude of other gasses, are continually passing and repassing. Vapour, therefore, of some kind or other, must, at all times, constitute an essential part of atmospheric air, yet the portion it constitutes is but small, seldom, in general, exceeding a hundredth part of the whole: the rest consisting of elementary heat, or caloric, a most active and volatile substance, largely diffused through all nature, of azotic gas, or mephitic, and of a most recondite fluid, which it is the boast of modern chemistry to have discovered characteristically; which, when separated, is found to be three or four times purer than atmospheric air in the gross, and will hence preserve combustion and animal life three or four times as long: This mysterious gas, though suspected by modern chemists, from the era of Van Helmont, was by no means fully traced, or its properties fairly specified, till the experiments of Dr. Priestley gave it 'a local habitation and a name:' for he obtained it from a variety of substances in a pure and uncombined state, and denominated it *dephlogisticated* air; converting, in this appellation, to a system of his own founding, and known by the phrase of the phlogistic system. It soon, however, became a matter of great doubt, among contemporary chemists, whether there were any such thing as phlogiston in nature; and hence Lavoisier banished the name altogether from the French school of chemistry, and re-denominated the newly discovered aura, vital air, or oxygen. Oxygen, in its state of purity, and freed from every other substance, is never volatile, but remains fixed to the body it inhabits; yet, combined with the elementary heat or caloric of the atmosphere, it is volatilized instantaneously, and exhibits itself by a thousand magnificent and stupendous properties. It is this, indeed, that gives life and spirit to the whole atmosphere; for, when once abstracted, atmospheric air becomes totally unfit for the purposes of respiration, vegetation, or combustion. It occupies about a fourth part of the common air of the atmosphere: the remainder of which, as incapable of supporting the phenomena of animal life, is denominated mephitic, or azotic gas; and which, as filling nearly three quarters of the atmosphere, may be well entitled to the appellation of *air* alone.

"Respiration, then, is an action contributing to the renovation of life by the communication of atmospheric air to the precordia: the air so communicated, in a manner to the present moment undetermined, becoming hereby decomposed or separated into four, or perhaps a greater number of simpler gasses, of which each contributes, in a greater or less degree, to the preservation of life and sensation; and especially the caloric, which seems to afford that continual supply of heat that is absolutely necessary, from the freedom with

which every individual member parts with its heat to circunjacent and external substances; and more especially still, the oxygen, which, by Spallanzani and Girtanner, is supposed to stimulate the heart itself into action, and to be the immediate cause of all muscular irritability, and consequently of vitality itself. A small portion, however, of this important gas, we detect returning from the lungs in the act of expiration, combined with a substance generated in the blood; and which, from its resemblance to various properties of charcoal, the French chemists have named carbon; the fluid produced from this union, and discharged in expiration, is denominated carbonic acid gas.

"I pretend not to affirm what was the immediate aura understood by Lucretius as the fourth and most important substance in the composition of the animal spirit; and which, he tells us, was so recondite as to be incapable of being traced otherwise than by its effects. To the oxygenous and the galvanic gas it has an equal and an astonishingly

striking resemblance. If we suppose our poet intended something like the former, although he has not given it its modern name, he has described the very thing itself, endued it with its characteristic properties, asserted its entire supremacy, and established in its immediate seat of empire, the heart and lungs. He has given us, indeed, whether to allow this to be a fact or not, as complete statement of the gasses of which the animal breath or spirit consists, as if he had lived the present day. And what is more extraordinary still, though he enumerates the three substances of heat, air, and vapour, as first rejected in the act of expiration, he makes mention of the return of this fourth, and, in his era, unnamed substance; while, nevertheless, as already observed, he deems it the most powerful agent in the composite spirit inhaled, and the sensorial faculty engendered. The following table of the Epicurean and Lavoisierian analysis of respirable air, will still more clearly point out the resemblance between them:

"Respirable air of Lucretius contains

Calor;

Vapor;

Aër;

Unnamed; but which is of far more importance than all the rest to the renewal and prolongation of animal life, eluding all sensible investigation, and only traced from its effects.

"Respirable air of Lavoisier contains

Caloric;

Vapour,—exhalation from water, and of substances;

Azote, occupying three-fourths of the whole atmosphere; and hence, more properly than any other simple fluid, denominated air.

Oxygen, without which it is impossible for life to subsist: the boast of modern chemistry, and which was totally devoid of name and generic character till the present era."

This comparison is no doubt conducted with ingenuity; this minute parallel with modern chemistry will however, at first view, be deemed by the cautious reader liable to suspicion; and it is necessary to observe that, whatever be the case with respect to the chemical analysis, the analysis of the Lucretian and Epicurean philosophy is not in this instance perfectly accurate: for Lucretius is speaking, not of respirable air, which has sensible weight, but of the soul, which has no sensible weight. His division of substances, moreover, is not calor, vapos, aer, et quarta quædam natura, nominis expers; but tenuis aura, calor, aer, and the unknown cause of sensibility, calor and vapor being in this passage terms perfectly synonymous, as will be evident to any one who peruses the original passage, and as they are interpreted by Lambinus and Wakefield. So also Plutarch, in a passage quoted by Mr. Good, describes the soul, according to the Epicurean doctrine, as *κράμα ἐκ τεσσάρων, ἐκ ποίου πυρρός, ἐκ ποίου αερῶδους, ἐκ ποίου πνευματικῶς, ἐκ τεταρτου τινος ἀνα-*

τομυζατου, ὅ ἐν αὐτῷ αἰσθητικόν. D. plac. phil. iv. 3. Part of this passage is thus strangely rendered by the interpreter, "ex quatuor qualitibus, ignis, ærea, aqua."

Amidst the multifarious mass of materials which constitute the notes of the present volumes, it will not be surprising if a few trifling errors have insinuated themselves, chiefly of such a nature as humana parum cavit natura, and which will be obvious to the author on a re-perusal of his work. Such is the chronological lapse of referring a sentiment in Lucretius to Isidorus, a christian father (1,180), of representing the age of Hippocrates as antecedent, by five centuries, to that of Epicurus (11,196): The epithet of boves Lucæ, applied to elephants, is not derived from Lugano, a town of the Milanese, but from Lucania, a southern province of Italy. It does not appear that Pyrrhus, in whose army the Romans first saw elephants, was ever in the north of Italy. The true explication of *ferro mactæ*, applied to these beasts, is not *ferro*

Fassus, but *ferro male habitæ*, as is justly remarked by Mr. Wakefield. The reference on this subject to that editor must have proceeded from too hasty an inspection of his note.

We take our leave of this translation with much admiration of its general me-

rits, and much respect for the ingenuity, learning, and taste of the translator. He has executed his labour in a manner highly reputable to himself, and filled a place which was vacant in the catalogue of English literature.

ART. VII.—*A Grammar of the Greek Tongue, on a new and improved Plan.* By JOHN JONES, Member of the Philological Society at Manchester. 8vo. pp. 360.

THOUGH the Greek language has been assiduously cultivated in the learned part of Europe for upwards of three centuries, yet such is the copiousness and richness of that tongue, combined with the disadvantages arising from its having ceased to be in oral use, that we have as yet no lexicon or grammar of it which can be deemed complete. To obviate the latter of these deficiencies, or at least to facilitate the acquisition of the Greek language, and to illustrate its rules, by the application of philosophical principles to its grammar, has been the object of Mr. Jones in the work which he has here presented to the public.

"The principles, which distinguish this Grammar, are such as were suggested by a study of the oriental tongues, especially of the Hebrew. The latter language is known by all competent judges to be the mother of the Greek. It cannot therefore be deemed surprising, that the origin of those qualities which characterise the child can be found only in the constitution of the parent. Proceeding on this ground the writer, conformably to the system of the great grammarian of our age, has traced the definitives, the prepositions, and many of the particles, to Hebrew nouns or verbs: and from those roots has deduced a primary signification, into which are resolvable all their figurative or secondary senses, however numerous and complicated.

"By considering the Greek terms, as existing in their primitives, and before they were modified by Greek terminations, the author has, moreover, been able to ascertain the exact meaning of the cases; and the application of their meaning, thus ascertained, to the syntax of the language, forms another peculiar feature in the character of this grammar.

"The Hebrew tongue, on account of its high antiquity, holds forth to the philosophical enquirer into the origin of language, the several steps which the human mind adopted in the formation of speech. Among these steps the following is worthy of notice. Words, denoting active qualities, i. e. those ideas, which the mind acquires by reflecting on its own operations in given circumstances, are no other than the names of the *subject* and *agent* in the same circumstances, combined into one

term; in other verbs are the names of sensible objects with the personal pronouns annexed to them.

"This principle, suggested by the Hebrew, is applied to the Greek: and hence all the variety of terminations belonging to the Greek verb, which, by their vast number load the memory, and retard the efforts of the learner, are reduced to six pronouns. The same principle has enabled the author to resolve the two classes of verbs, in *σ* and in *μ*, into one common form; to account for the origin of the active, passive, and middle voices, and to assign to the two last the cause of their peculiar signification.

"This principle, eminently useful in a grammatical light, is yet more so in another point of view. Terms, denoting active or abstract qualities, as having no prototype corresponding to them in nature, a reference to which might serve to define and perpetuate their signification, are liable to endless fluctuations and misconceptions. But this is not the case with the names of sensible objects. These, continuing much the same in all ages and countries, convey, when impressed on the organs of sense, accurate ideas of themselves; and thus in general render the meaning of their terms correct and invariable, though transfused from one language to another. In order then to fix the primary sense of a verb, it is only necessary to have recourse to the noun whence it is derived; and what cannot be established by this mean, is likely to be effected by recurring to the primitive term, as existing in one of the oriental dialects."

In the execution of this plan Mr. Jones has displayed much learning and ingenuity. It is manifest, however, that in a practical grammar of any language, it is requisite to pay as much attention to its peculiarities and idioms, as to the general philosophical principles on which it is constructed. With much knowledge of abstract principles, and much facility in tracing them, we suspect that Mr. Jones does not combine all that minute accuracy in the historical and idiomatical part of language which its importance merits. P. 3, the contraction *y* of the diphthong *ui*, is of far subsequent date to the formation of the Latin character *y*, and of power widely different. Whenever there is occasion to express the diphthong in Latin, it is re-

presented, not by *y*, but by *yi*, as in the word *Ilithyia*.

P. 12. The Attic form of the second declension extended only to particular words, hence we do not find such forms as *λογος*, *ἱερων*, &c.

P. 126. The word *εσσαω* has no appearance of a primitive form. The genuine root is, doubtless, *σω*; *ἑσσαμην*, with a reduplicated sigma, is for *ἑσαμην*, the regular first aorist middle of *σω*.

P. 127. The rule respecting contraction is too general. "All contraction, whether simple or compounded, is the coalition of two short vowels." The attic contraction *εψα*, for instance, is formed by the coalition of a long vowel with a diphthong.

P. 325. *ὡς ταχὺς μεταβαλὺσθαι*. We imagine that few persons will coincide with Mr. Jones's analysis of this passage, *εβαλὺσθαι μετὰ λαοῦσιν*, or hesitate to concur with that interpretation of Mr. Porson, which our author condemns as manifestly erroneous, insaniam sanitate puniti.

Mr. J. appears to us, in some instances, to rely on the hypothetical principles which he advances, with rather more confidence than is warranted by their evidence, and to be sometimes unduly influenced in his analysis of the Greek language by his partiality for oriental literature.

By the extract which we have given from the preface, our readers will perceive that he has adopted the system of Lennep and Schreidius, who consider the verbs as formed through all their inflections by the combination of a radical term with the various pronouns. This scheme, to a certain extent, is indeed not improbable, and it is countenanced by the oriental tongues. It however accounts only for the persons, not for the tenses or moods, and it is exceedingly difficult, if not impossible, to trace it through the various

changes of the Greek verb. It is also to be observed, that some languages, the German for instance, and our own, possess varieties of termination indicative of the person, while the addition of the pronoun is still requisite.

Mr. Jones seems also to consider the noun too exclusively as the primitive part of speech. Hence in the chapter, entitled nouns converted into verbs, it is requisite sometimes to change the order of his derivation, *Εἰμω*, *imago*, is evidently formed from *εἰμι*, *similis sum*, not the verb from the substantive.

But it is on the subject of etymology that Mr. Jones appears to us to expose himself most to objection. He has adopted without reserve the hypothesis, in our opinion by no means fully established, of the derivation of the Greek from the Hebrew language, and accordingly never seems to be at a loss for the radical of any term. But who can rest with any confidence on such derivations as the following! *ὕπερ* from *וְיָנֵא* a wing, *ἀμφι*, from *אֶבֶן* a round stone. There are indeed principles by which any language may be derived from any other, but we much doubt whether the clear instances of coincidence between the Greek and Hebrew may exceed an hundred, if they even equal that number. Some very just remarks on a similar subject may be seen in one of the appendices to the new edition of Bruce's *Travels*, Vol. II. No. 11. p. 467.

Impartiality has compelled us to make a few deductions on the ground of inaccuracy, which the author himself indeed candidly acknowledges, from the general merit of this volume. We cannot take our leave of it without remarking that it exhibits many proofs of ingenuity and extensive research, of a mind acute and vigorous, and habitually, and often successfully, employed in philosophical investigations.

Acc. VII. — *The Tomb of Alexander — A Dissertation on the Sarcophagus brought from Alexandria, and now in the British Museum.* By EDWARD DANIEL CLARKE, LL.D. Fellow of Jesus College, Cambridge. 4to. pp. 161.

THE fond regard with which mankind have ever viewed the relics of departed greatness needs not to be enlarged on here. Alexander himself viewed the tomb of Cyrus with singular respect: he bestowed a crown and placed his signet on it; and showed it similar honours to those which Augustus afterward bestowed on his. Yet surely, in these times, when the revolutions of states have been more frequent

than in former ages, and when traditions have been less coherently preserved, the authenticity of such a relic should be ascertained with mathematical exactness before it is admitted. So lately as the middle of the last century but one, the discovery of the supposed tomb of Moses, by some goat-herds, in the valley of Mount Nebo, filled the face of Europe with amazement, till a learned Rabbini proved

the sepulchre in question to have contained the body of a Moses long subsequent to him who was interred there by the ministry of angels.

Dr. Clarke and his friends have taken no ordinary pains to prove the curious chest, which is now at the British Museum, to be the actual depository of the Macedonian hero; and they have brought together a body of materials, which certainly does credit to their learning: they have arranged their evidence to the very best advantage; they have both studied and enlarged on every point that could bear, however remotely, on the question; and they have added to it all the embellishments with which the arts of printing and engraving could assist them. How far these exertions have been successful remains to be enquired. Even failure in this instance is entitled to respect.

In the introduction, among many observations on the portrait of Alexander, Dr. Clarke endeavours to prove, that in the various homage that was paid to him he was worshipped as an *Egyptian God*: and the type of his apotheosis, he observes, the Ammonian horn, appears, in almost every instance, where his portrait is represented, particularly on the medals of Ptolemy. And this typical representation he considers to be further confirmed by the collateral evidence of the hieroglyphic characters inscribed on the sarcophagus in question: a consideration which to us seems premature; because it is necessary that its connection with Alexander's body should be first established.

The chest at the Museum, it appears, at an early period after the invasion of Egypt, was shown to Denon and Dolomieu in the mosque of St. Athanasius, at Alexandria, where it had been preserved for centuries within a small enclosure, which few but Mahometans were allowed to enter. From the account which the former gave however, they do not seem to have been aware that it was the reputed tomb; they only considered it as one of the best spoils of antiquity that Egypt could be plundered of, and as exhibiting a finer and more numerous assemblage of hieroglyphic figures than any monument in their possession. The enthusiasm with which it is mentioned by Denon seems misinterpreted by Dr. Clarke, who thinks it curious to observe with what caution the traveller has touched upon the subject. His words, he says, 'like the hierogly-

phics which so much engaged his attention, contain a meaning beyond their common acceptance, reserved, doubtless, for the initiated. The tomb is no longer a theme of triumph to his countrymen. Enough has been said to convince them of its importance; and the rest may be reserved till the moment arrives, when, according to their moderate expectations, the invasion and conquest of this country shall have restored the precious relic to their hands.' But we have been assured, and that upon the best authority, that the French savans were unable to trace the most vague tradition in the country, as to the history of this sarcophagus, though repeated efforts were made of the best informed persons; and although the most cunning of the natives are always ready to invent any story which may humour the fancy of a credulous traveller, not one even dropped a hint of Alexander's tomb. Dr. Clarke asserts too, that when taken from the little chapel in which it had been kept, it was borne away amid the howling and lamentation of its worshippers; that it excited insurrection among the people; and that after its removal the most cautious measures were used to conceal it from observation. But if we may be allowed to judge from Dr. Wittman's words, there certainly were travellers who, previous to its removal aboard the French vessel in the harbour, saw it lying quietly with other antique remains at the Rosetta gate of Alexandria. When it was removed on board the vessel to be conveyed to England, the natives, we believe, merely showed it that homage which they are accustomed to pay the finer monuments of their country, inscribed with hieroglyphic characters; they touched it with their hands, and kissed it.

After the assertions we have mentioned Dr. Clarke becomes a prophet, and foretells the vicissitudes that would have marked its history had it been removed to France.

"Other vicissitudes awaited this remarkable monument. A British army came to give life and liberty to the oppressed inhabitants of Egypt; and the tomb of the greatest conqueror the world ever knew devolved, by right of conquest, to their victorious arms. Had it been conveyed to the metropolis of France, instead of the silence which is now so cautiously observed respecting it, Europe would have been told; that an hieroglyphic inscription having recorded the actions of a Ptolemy,* the Alexandrian sarcophagus, in

* "Inscription on the Rosetta stone, in honour of Ptolemy Epiphanes, written in the hieroglyphic character subsequent to the time of Alexander the Great."

the same language, might also relate the expeditions, the conquests, and the glories of Alexander. A prodigious temple would have been erected in the midst of Paris; where, to complete the mockery of Buonaparte's imitation of the son of Philip, the same tomb that had once inclosed the body of that hero would have been reserved for the bones of his mimic."

Having introduced a narrative of the means by which it was found and recovered from the French, he endeavours to show that the uniform tradition of the inhabitants of the country, supported by historical evidence, clearly proves this interesting monument to be the tomb of Alexander the Great. But at the very outset of these observations a remark occurs, in which we cannot persuade ourselves to acquiesce. It will be necessary, we are told, to examine with particular attention the account given of the deification of Alexander, and the means used to preserve his body; as the notion of a gold and glass coffin has involved the history of his interment in some error, by being confounded with the *SARCOPHAGUS* which Ptolemy, according to the custom both of Greeks and Egyptians, prepared for its reception. But this is a most gratuitous admission. It is a fact given to us upon the authority of no one writer of antiquity. *Tomb*, the word used by Diodorus Siculus means a sacred inclosure, and applies more to the immediate building that contained the body, than to any sarcophagus or outer chest. *Conditorium*, the term Suetonius uses, though not equally extensive, cannot be translated a sarcophagus, and it is also the expression used by Pliny. But let us here, once for all, canvass the meaning of the sentence in Diodorus Siculus that is alluded to. It simply states, that the sacred repository prepared for Alexander's corpse, both in magnitude and workmanship (*κατα το μέγεθος καὶ κατὰ τὴν κατασκευὴν*) was worthy the greatness and the glory of Alexander. And will any one support the idea, for a single moment, that Diodorus Siculus had nothing more in view

than this (in comparison with his description) poor sarcophagus: *ten feet in length, five feet and a half in width, and four feet high*? But Dr. Clarke builds much upon these words, as may be shewn from various parts of his book, but particularly in the instances we here quote. The first is in the abbé Winkelman's description of the *breccia* of Egypt.

"Le vert est la couleur dominante de cette pierre; couleur dans laquelle on remarque des degrés et des nuances infimes; de sorte que je suis persuadé que JAMAIS PEINTRE NI TEINTURIER N'EN A PRODUIT DE PAREILLES: le mélange de ces couleurs DOIT PAROÎTRE MEILLEUX (*agreeing exactly with the words of Diodorus respecting the tomb*) aux yeux des observateurs attentifs des productions de la nature."

Again, in p. 43.

"We have thus a proof that the stone used in this sarcophagus was of a rarity and price equal to that of the most precious materials of ancient art.* The expence of working it could be undertaken only by sovereigns, who might procure, among the renowned artists of those times, talents and perseverance adequate to the achievement of such a surprising work. In these days, the substance itself, and the process by which it was wrought, being unknown, a notion of supernatural agency is excited in unenlightened minds;† while the refined part of mankind express their astonishment. If, at any period of the history of the ancient world, a work of the nature particularly corresponded with the genius of the age and the wishes of the people, it must have been at that important crisis, when the body of the deified Alexander was received by Ptolemy, to be enshrined as the son of Ammon, by the priests of Egypt. That the construction of the tomb would demand every thing admirable in materials and in workmanship cannot be disputed; but upon this subject we have sufficient proof from the testimony of ancient historians. Diodorus, whose description of the funeral pomp seems to convey an adequate idea of the magnificence with which it was celebrated, represents it,‡ in magnitude and workmanship, worthy the greatness and glory of Alexander."

* "Instances have occurred in our own times of sovereigns who appropriated to their own use extraordinary products of the mineral kingdom. The late empress of Russia collected that beautiful substance called the Amazonian stone, or green Siberian feldspar; which, since her death, has found its way into the other cabinets of Europe."

† "The inhabitants both of Greece and Egypt attribute the prodigious works they behold to the agency of supernatural beings. More enlightened nations affect to ridicule the simplicity of their minds; yet it may be true that the combined talents of all the artists in Europe, stimulated by the patronage of all its sovereigns, could not equal the tomb of Alexander."

‡ *Κατὰ μέγεθος αὖν τεύμενος κατὰ τὴν μέγεθος καὶ κατὰ τὴν κατασκευὴν τῆς Ἀλεξάνδρου δόξης ἀξίων.* "Quapropter delubrum, cum magnitudine, tum structura, majestate et gloria Alexandri dignum, illi fecit." Lib. xviii. c. 28.

Even in the discovery of this curious tomb (if a square chest can be entitled to the appellation) there is an air of mystery and reserve that is inexplicable. Nor after all is it quite clear that he was told even at Cairo, where he affirms that he first heard of it, that it was the tomb of Alexander. His words are these :

"In the course of my enquiries respecting the Rosetta stone, which I was very anxious to have included among the articles to be surrendered, and of which, at that time, we had obtained but a faint and imperfect history, it was made known to me, that another stone, of much larger dimensions, was in the possession of the French, guarded with the greatest secrecy, and concerning which they entertained the most lively apprehensions : deeming it even of more importance than the stone found at Rosetta. The persons who gave me this information, and whose names it certainly would not be prudent to make known, while there is even a chance of their receiving another visit from the French, further added, that this stone, which they described to be of an astonishing size, and a beautiful green colour, was somewhere concealed in Alexandria.

"With this intelligence I set out from Cairo for the British camp, at that time stationed on the heights they had retained after the action of the 21st of March, 1801 ; and took the earliest opportunity of seeing the commander in chief. The distance was great, and the capitulation daily expected to take place. It is to the situation of Alexandria and Cairo with respect to each other, that the want of precision must be attributed which appears in the account given of this monument in the latter city."

In page 44, Dr. Clarke opens the series of testimonies which respect the actual tomb, with the death of Alexander in the 323d year previous to the christian era. But lest the reader should forget the sarcophagus at the Museum, it is introduced again. And in a few sentences he traverses the principal countries of the habitable globe, among whose rites of sepulture sarcophagi appear to have been used ; but in none does he pay any attention to chronology. This mode of interment, he says, belonged to persons of the highest rank, and as an illustration gives this note :

"So Joseph died . . . ; and they embalmed him, and he was put in a coffin in Egypt." Gen. chap. l. ver. 26.

Now this ought certainly to have been a key to Dr. Clarke, and to have informed him that the few sarcophagi, which it is at this day in the power of Egypt to produce, can only be ascribed to the earliest

ages of its history. The *onus probandi* is still his own : and we will venture to assert, that he is incapable of bringing forward one single proof that such sarcophagi as those which are now preserved at the British Museum were used in Egypt for sepulchral purposes in the days of Alexander. The practice had gone by even when Herodotus wrote, or he would never have told us that the Egyptians were accustomed to inclose their dead in wooden cases, and that they deposited them regularly in an upright posture. How inconsistent Dr. Clarke is with himself, we shall show in one single instance. He here acknowledges, that Joseph was put into a coffin of like form, and that similar sarcophagi are found in other countries, but in p. 75, he says,

"Let it also be remarked, that the Alexandrian sarcophagus bids defiance to the arts, at any other period than that of Ptolemy, and in any other country than that of Egypt."

After various remarks on the deification of Alexander, Dr. Clarke appears to take it for granted, that nothing Greek could possibly be expected to distinguish the place of his deposit. For that with the Egyptians, under such circumstances, it could not pretend to be the tomb of Alexander. 'For if the tomb of an Egyptian god should exhibit the letters of the Greek alphabet, instead of an inscription, ΕΝΤΕΡΟΙΣ ΓΡΑΜΜΑΣΙΝ, it would thereby contradict all our knowledge of history and of ancient Egypt.' But there is one fact, and it is a fact recorded by Pausanias, that militates very forcibly against these remarks. It is a fact too, which Dr. Clarke in the testimonies, and Mr. Henley in the additional remarks, have kept entirely from the reader's view. It is that Alexander was buried, not according to the funeral rites of Egypt, but *κατὰ τὰν Μαικεδονικὴν, with Grecian rites*. Why was the following passage omitted in the testimonies ?—καὶ Μακεδόνων τοὺς ταχέως τὸν Ἀλεξάνδρον νεκρὸν ἐς Αἴγυπτον ἀνέπεισεν αὐτὸν παραδιδόναι, καὶ τὸν μὲν ΝΟΜΟ ΤΩΝ ΜΑΚΕΔΟΝΩΝ ἐθαπτεν ἐν Μελφί. Yet, says Dr. Clarke, p. 49, 'We have sufficient proof of the indispensable necessity of hieroglyphic characters.'

But once more we resume the testimonies. The funeral procession, conducted from Babylon by Perdiccas, was met on the confines of Syria by Ptolemy ; its destination was changed ; till a sumptuous shrine could be prepared for its reception, it was conveyed to Memphis ; and, ulti-

mately, brought to Alexandria. Ptolemy Lagos, by whom the shrine had been prepared, placed it in a coffin of gold, in which condition it appears to have remained rather more than two hundred and fifty years, when the gold coffin was exchanged for a glass one by Ptolemy Cybiolactes. That there was an outer coffin of marble, as Dr. Clarke asserts, (p. 55) we have no authority for saying or supposing.

The imperial visits which the tomb, from time to time, received, enable us to trace its history for about three centuries more with tolerable certainty; the first upon record was Caesar's, and the interest it excited in his mind was well described by Lucan. But Dr. Clarke's mention of the circumstance is slight. He has not quoted a single line from the poet. That was reserved for Mr. Henley, who has quoted him in a mutilated form. The three first of the following lines are *totally omitted* in p. 98. Caesar, we are told,

" — Nulla capitur dulcedine rerum,
Non auro, cultuque Deum, non magnibus urbis,
Effossam tuniulis, *cupide descendit* in antrum.
Filic Pellaei proles vetana Philippi
Felix praece jacet : " —

LUCAN, Lib. 10.

The idea of a subterranean vault also was given two books before in the line

" Cum tibi sacro MACEDON servetur
in anro."

And if we compare these (in the former of which the sepulchres of the Ptolemies are afterward included) with the following note in page 54, we shall probably see the reason both of the omission and the mutilation.

" An account of extraordinary subterranean excavations, westward of Alexandria, may be expected from the French, in whose hands I saw very accurate and beautiful drawings of them. They were regarded by some as the sepulchres of the Ptolemies."

They who regarded these excavations as the sepulchres of the Ptolemies never could have looked for Alexander's tomb in the mosque of St. Athanasius. The authorities which Dr. Clarke has himself brought together, prove Alexander and the Ptolemies to have been interred in the same depositary.

" * At that time the whole of the Peribolus, called Σαῦρα by Strabo, bore the name of the tomb of Alexander."

† " Dio Cassius, lib. lxxv. c. 17. A most extraordinary error appears in Suidas, where this act is attributed to Severus the Sophist (see Lexicon, vol. iii. p. 294. Σοφιστής). His commentator, in noticing the mistake, justifies the author, by observing that the name of the Sophist has been inserted in a part of the text belonging to Severus the emperor."

‡ " Herodian Hist. lib. iv. edit. Histor. Rom. Script. H. Steph. 1568."

About thirty years before the birth of Christ, Augustus visited the tomb. He saw, says Diodorus Siculus, the body of Alexander, and touched it; so that a part of the nose, as they relate, was broken off. Stetotinius, moreover, relates the veneration with which he viewed the sepulchre. When the body was taken from it (Dr. Clarke says from the sarcophagus, such is his translation of *prolatum e pectore*) he placed a golden crown and scattered flowers upon it. And when the priests asked him if he would not also see the bodies of the Ptolemies, and the shrine of Apis, his reply was, that he came to see a king, not the bodies of the common dead; and that in respect to Apis, he had been accustomed to worship gods, not oxen.

Rather more than two hundred and thirty years had elapsed from the visit of Augustus, when Septimius Severus came to Alexandria. Though in the interval Caligula had obtained the breast-plate, and wore it in his pantomimic triumphs.

" Severus, whose thirst of knowledge, and enterprising curiosity, caused him to penetrate into all parts of the country, and to visit whatever might illustrate the policy and literature of Egypt, collected, according to Dio Cassius, the sacred volumes, containing the writings of the priests and the explanation of their hieroglyphics; and having deposited them in the tomb of Alexander, * caused the monument to be shut; that the people might not, through their influence, be excited to sedition; and that for the future no person should have access to the shrine." †

Lastly, among the classical authorities, comes the visit of Caracalla.

" Caracalla, whose fondness for the name and ensigns of Alexander is still preserved on the medals of that emperor, made his veneration for him, and his desire to consult a God so much revered by the inhabitants, the pretext for his visit to Alexandria. Herodian relates, ‡ that the magnificent preparations to receive him were greater than for any former emperor. They met him with the liveliest demonstrations of joy, sparing neither expence nor toil to render his reception splendid and honourable. As soon as he arrived within the city, he entered the temple, immolating victims, and heaping incense upon the altars. He then visited the

monument (Μνημεῖον) of Alexander, and placed upon the tomb (τῷ Σοφῷ) a purple vest, together with splendid rings set with the most brilliant gems, a rich girdle, and various other costly offerings.* The Alexandrians, duped by his hypocrisy, and believing the shrine which his father had closed would be again open to their adoration, as well as protected by their emperor, gave way to the most extravagant joy, and passed whole nights and days in festivity; not knowing, says the historian,† the vindictive machinations of the king."

The venerable records from which evidence is thus far obtained, now fail us. The time was approaching when a revolution, producing a total change of religious sentiments in Alexandria, materially affected the safety of the tomb. In consequence of the insults which Theophilus, who then filled the archiepiscopal throne, offered to the pagan temples, the greatest disorder took place in the city. An appeal was made to Theodosius to decide the quarrel between the heathens and the christians, and the consequence was an imperial mandate in the year 389 for the destruction of the idols of Alexandria. The idols themselves, says Dr. Clarke, were speedily demolished; and, doubtless, the body of Alexander was not spared when the statue of Serapis was destroyed. But if the statue of Serapis was destroyed, what reason have we to suppose that the tomb of ALEXANDER would be suffered to remain? Indeed we have something more than an inference to produce that it must have been destroyed; for eight years after, when Chrysostom reproved the people of Antioch for wearing the image of the son of Ammon, he triumphantly exclaimed, "Where is now the tomb of Alexander? show me!" the words are remarkable.—Που γὰρ εἶπε μὴ τὸ ΣΗΜΑ Ἀλεξάνδρου; δείξον μοι.

This passage, with the words that

follow, are supposed by Dr. Clarke only to contrast the *fallen dignity* of the tomb with the veneration paid to the sepulchres of the martyrs; but with us, if they mean any thing, they imply that the tomb of Alexander was in the time of Chrysostom no longer to be seen.

Other annals, we are next told, not less respectable, nor less entitled to attention, preserve the memory of Alexander's tomb. These are the oriental historians. But Dr. Clarke has not found a single original writer from whom he could even glean a solitary sentence. The Arabian, the Persian, and the Turkish writers, who have recorded the conquests and the actions of Alexander, are carefully enumerated; but Dr. Clarke has very wisely given us no history of their contents. For they say nothing of the tomb. He only observes at the close,

"The Arabians had a peculiar claim to the knowledge of Alexander. It is recorded by Arrian,‡ that he had endeavoured to hold the third place in the list of their gods; and among the surprising revolutions of empire and opinion, they were ultimately destined to become the guardians of his tomb."

The invasion of the Saracens, and the conquest of Alexandria, in the year 640, forms the next object of attention.

"With the entrance of the Arabs we look once more to the tomb of Alexander; and we find that almost one of their first measures, upon gaining possession of the city, connects itself with the sarcophagus. The peribolus which inclosed this monument, together with the tombs of the Ptolemies, had been converted, at the downfall of paganism, to a christian church, bearing the name of St. Athanasius. The same building, at the conquest of the Arabs, once more changed its nature, and became a mosque; but the name of the saint to which it was dedicated by the christians was still annexed to it by the mahometans, and it was called the mosque of St. Athanasius.§ By this fortunate circumstance

* Ὡς δὲ εἰσῆλθεν εἰς τὴν πόλιν σὺν παντὶ τῷ στρατῷ, πρῶτον εἰς τὸν νεὺν ἀνελθὼν, πολλὰς ἐκατόμβας κατέβησε, λεβάνῃ τε τοὺς βωμούς ἐσώρευσεν. ἐκέλευεν δ' ἔλθαι εἰς τὸ Ἀλεξάνδρου ΜΝΗΜΑ, τὴν τε χλαμύδα τὴν ἔσπερον ἀλουργή, δακτυλίους τε οὓς εἶχε λίθων τιμιῶν, ἡστέγρας τε καὶ εἰς πολυτελεῖς ἔφερε, περιελθὼν αὐτοῦ, ἐπέθηκε τῇ ἐκείνου ΣΟΦΩΙ. "Sed ubi in urbem jam pervenit, primò quidem templum ingressus est, in illisque victimis immolatis, ac thure cumulatè altaribus, ad Alexandri Monumentum se contulit, paludamentisque purpureis, et claris speciosisque gemmis anulos conspicuos, balteumque et si qua alia gestabat elegantiora, dempta sibi, tum illis imposuit tumulo. Herodiani Hist. lib. iv. Ibid."

† "Ibid."

‡ Οὐκ οὐκ ἀπεχρὸν καὶ αὐτὸν τρίτον ἀννομεσθῆναι πρὸς Ἀράβων θεόν. "Quapropter non indignum censebat ac, qui pro tertio Deo apud Arabas haberetur. Arrian. Gronovii. L. Bat. 1704. lib. vii. p. 300."

§ "The mosque of St. Sophia, in Constantinople, is another instance of the same kind; and other christian churches in Turkey preserve their original name, though converted to mosques."

we are enabled to keep our view faithfully directed, in all the periods of its history, to the particular building in which the body of Alexander was placed; and, having found the tomb stationed exactly as historians have described it, meet with an ultimate consummation of the evidence in the tradition and records of the Arabs; who, while they prostrated themselves to do it homage, declared it to be the tomb of Alexander, the founder of the city of Alexandria."

But where are the authorities for all these strong assertions? Let the reader only turn to the view of the great court of the mosque that is copied from Denon, and he will see in one moment that the arabesque colonnade that surrounds it is of a period very long subsequent indeed to the conquest of Alexandria in 640. We doubt if it has stood four hundred years.

Benjamin of Tudela, a Jewish traveller of the twelfth century, is the next testimony that is brought; and he, it appears, saw a large sarcophagus upon the margin of the sea. It was engraved with the figures of animals and hieroglyphic characters; and was conjectured to have contained the body of some king before the deluge. Its breadth was six, and its length fifteen spans; and Dr. Clarke, without entering into any inquiry as to the nature of the span, though at the same time aware of the general coincidence of the sarcophagus with that at the Museum, conjectures it to have been one of the tombs of the Ptolemies removed from the SOMA to the sea-shore, and neglected among the ruins.

Then we have the authority of Leo Africanus, who visited Alexandria in 1491, and whose text is literally translated in these words.

"Neither ought it to be omitted, that in the midst of the ruins of Alexandria, there still remains a small edifice, built like a chapel, worthy of notice on account of a remarkable tomb, held in high honour by the mahometans; in which sepulchre, they assert, is preserved the body of Alexander the Great, an eminent prophet and king, as they read in their koran. An immense crowd of strangers comes thither, even from distant countries, for the sake of worshipping and doing homage to the tomb; on which, likewise, they frequently bestow considerable donations."

Marmol the Spaniard gives a similar account; but almost in the very words of Leo: and immediately afterwards we have an extract from the *Dictionnaire Originale* of D'Herbelot, who mentions,

from a Persian writer of the sixteenth century, a fact which even Dr. Clarke's ingenuity cannot reconcile with his other testimonies. For it is there asserted, that the coffin of gold was *exchanged by Alexander's MOTHER* for one made of *Egyptian marble*; and this even in the life-time of Ptolemy Lagus, who had built the shrine. But, on this incoherent evidence, Dr. Clarke does not condescend to offer a single observation.

Sandys, who went to Egypt in 1611, mentions the tomb as reported to be in the possession of the musselmen, but in such a way that he has been shrewdly conjectured to have borrowed his remarks from Leo. Their coincidence indeed is great; for they both speak of *Alexander's body* being preserved there: but, in Dr. Clarke's mind, this part of their evidence is immaterial. He takes what concerns the *tomb*, but leaves the *body*; having considered that *that* was probably demolished with the idols in 389: yet surely their testimonies must be as good upon one fact as upon the other. All this only serves to show that Dr. Clarke must himself have found insuperable difficulties in the compilation of his Memoir.

The principal of the modern travellers are next cited. They form a sort of chronological cavalcade; and follow each other for no better purpose than to swell the pomp of seeming 'testimony': for though the quotations from the different voyages, during a course of seventy years, from Pococke to Denon, occupy just twelve quarto pages, yet not one affords a single *iota*, either of evidence or conjecture, that the sarcophagus which forms the subject of the dissertation, and which was seen and minutely described by several of them, had any relation to the tomb of Alexander. The greater part of these travellers, with one or two more who have been omitted, expressly tell us that, though they made every inquiry possible about the real tomb, not even the wreck of a tradition could be discovered in the country that might relate to it. Yet does Dr. Clarke assert, at the close of his introduction, in the words of Gibbon, that "*The guardians of the most holy relics would rejoice if they were able to produce such a chain of evidence as may be alleged upon this occasion*;" a sentence which strongly reminds us of what we once heard in the court of chancery. A counsel had addressed the lord chancellor on the subject of a legacy for an hour and ten minutes, without making out even

the shadow of a case. On the side of the question he supported, he had six or seven juratory affidavits: and, in the warmth of winding up his speech, he said, "in short, my lord, I feel myself supported by such a cloud of witnesses, that I am sure your lordship will be convinced I set as confident as if I had Moses and his prophets to support me."

Throughout the work we cannot but observe that Dr. Clarke shifts his ground so frequently. When it suits his purpose, the sarcophagus may be as old as the time of Joseph. (See p. 47, note t.) Then it bids defiance to the arts at any other period than that of Ptolemy (p. 75.); and, in the very next page, after mentioning the gold coffin, he speaks of the sarcophagus as being *afterwards* constructed: and in a fourth place (p. 81.), it is referred to Olympias, Alexander's mother. All these little incoherencies may pass very well with superficial readers; but never can be expected to elude the discrimination of scholars. His testimonies, in this point of view, are too frequently deficient.

The ruins of Sais, which form so long and so irrelative a digression, never were either lost or doubted; so that the disco-

very of them ranks with that of the Vienna manuscript in the first number of the appendix, which, as it had been printed more than once, Dr. Clarke needed not to have gone so far to find.

Mr. Henley's Remarks on the Sarcophagus, in a great measure, contain a repetition of the facts we have already noticed. Still, however, they are curious, and are intitled to the reader's attention.

Professor Hailstone's letter is very minute in regard to the composition of the stone of which the sarcophagus is formed. We can only say that, if it had been shorter, it would have pleased us more.

These are the 'testimonies,' on the strength of the weakness of which we are called to decide. The sarcophagus which forms the subject of the work we readily admire; its beauty and its workmanship are exquisite; and we must own we should be better pleased could we subscribe to Dr. Clarke's hypothesis: but that, upon the evidence which he has brought together, it is impossible to do. The words of Chrysostom are as applicable at the present day, as when they were first spoken to the men of Antioch.

ART. IX.—*A Description of Latium; or, la Campagna di Roma.* 4to. pp. 268.

EVERY scholar and reader of taste must have experienced the great additional pleasure which is, in many instances, communicated to the perusal of the ancient writers, by an accurate knowledge of the historical facts to which they allude, and particularly of the objects of nature which they describe. Without this the impression made by many of their finest passages is vague, unsatisfactory, and feeble. The works of Virgil and Horace are early put into our hands; they are employed to form and refine our taste, and repeated study has rendered us familiar with their contents. But we deprive ourselves of one great source of satisfaction in reading their poems, if we have not familiarized ourselves, in imagination at least, with the scenes to which they perpetually refer, from which their works receive their colouring, and without some knowledge of which many passages are indeed scarcely intelligible.

No spot on the face of the earth can be more interesting from ancient recollections and associations than the immediate environs of Rome. Some trace of those pleasing fables, or those splendid histories, our acquaintance with which is coincident with the first exercises of the mind, is im-

pressed on almost every object. Rome still retains her empire. Her sovereigns indeed no longer sway the sceptre of the world; her pontiffs no longer give law to sovereigns themselves; but she is still the centre to which a great part of the history of mankind tends, her name is repeated with enthusiasm in every quarter of the globe, and the most distant traveller who arrives on that classic ground, treads the seven hills with the feelings of a citizen, and views the majestic ruins, the monuments of ancient fame, with mingled feelings of awe and delight.

The author of the work before us, whom we understand to be Miss Knight, author of *Dinarbas* and *Marcus Flaminius*, justly remarks, that however satisfactory and complete may be the accounts given by different authors of the city of Rome, and its more immediate environs, little has been said on a subject scarcely less interesting in any point of view, and undoubtedly in a peculiar manner grateful to the classical scholar, no less than to the painter and antiquary.

"The Campagna di Roma, or ancient Latium, comprises cities, towns, and villages, which date their existence from the earliest periods of history: many of them may yet

boast, in addition to the charms of situation, objects highly deserving the observation of travellers, although many of our own nation, who visit Italy with a desire of treading that earth which their early studies have taught them to love and respect, either from want of time, or from not being sufficiently apprised of the scenes still worthy their attention, leave the country without having seen more than two or three of the little towns at a short distance from the capital; and perhaps, having passed only a few hours in each, have not had an opportunity of viewing even these with advantage."

The object, therefore, of the present work, is to give an account of the present appearance of the Campagna, of its ancient state so far as it is deducible from the remaining monuments of its former greatness, compared with the descriptions of the Latin writers; interspersed with many anecdotes of history connected with the subject, chiefly relative to the ancient and middle ages.

The topographical part of the work is preceded by an introduction, containing a description of the situation and climate of the Campagna; an account, so far as can be collected from the dark and uncertain traditions which have descended to us, of the original inhabitants and early colonists of Latium; and the cities, roads, and villas, of the ancients. The following is the description of the rural amusements of the present Romans, during their annual absence from the capital in the season of autumn, and especially in the month of October.

"Most of the nobility, and indeed all who are in easy circumstances, either possess or hire houses for this month, at one or other of the little towns within ten or twenty miles of the capital. This is called going into *villeggiatura*; and it forms one of the principal pleasures of their existence. They esteem it not only necessary for their health, but essential to their making a respectable appearance in society; and individuals who have not the advantage of possessing a *casino*, hire lodgings in convents or private houses, for as much of the month of October as their finances will allow.

"Ecclesiastics, lawyers, physicians, and others who dress as *abati*, in black, with short mantles over their shoulders, for the rest of the year, wear coloured coats during this month; and even cardinals change their usual habit for a purple frock. Towards the end of September every Roman appears with a countenance enlivened by the expectation of an agreeable *villeggiatura*, except the few whom business or want of money detains in the metropolis; and these endeavour to console themselves, by wearing the habit of *vil-*

leggianti, and walking in the beautiful villas and vineyards which surround the city.

"None, however, anticipate with so much ardour, or enjoy with so much avidity, the pleasures of the month of October, as the scholars, and we may add the masters, of the different colleges and seminaries in which Rome abounds. Each of these houses has a *casino* at or near one of the *castelli*, as the little towns are usually denominated. On the happy day appointed for the change of habitation, a long train of coaches conveys the youthful *villeggianti* to the scene of delight, where, under the eye of their preceptor, they join in all the amusements which the country affords. Their studies are not, however, totally neglected; for, besides the lessons they receive on mineralogy and botany during their excursions, it is remarked, that some of their best exercises are composed spontaneously at these seasons of recreation.

"The time of *villeggiatura* is indeed short, but that very reason contributes to render it more delightful. The mornings are usually employed in walks or friendly visits; in the evening, those who have carriages take an airing; and afterwards, all assemble at one or other of the houses, where conversation and music for the young, and cards for the elder, engage their attention. On these occasions the nobility sometimes mix with those of an inferior class, particularly where balls or concerts are given. Races, and other amusements appropriate to the country, form also a part of their pleasures."

Deviating slightly in one or two instances from the order observed by the author, we shall proceed to give an analysis of the contents of this work under six principal heads.

1. The Appian way, and the adjoining objects. This celebrated road, one of the most remarkable monuments of Roman grandeur, in a species of public works in the construction of which they excelled all nations ancient or modern, extends from Rome towards the south. One of the first objects which occurs, is the small temple of Fortuna Muliebris, at the distance of four miles from Rome; said to have been erected in honour of Veturia the mother of Coriolanus, and the Roman matrons who accompanied her, when by her entreaties she prevailed on her son to desist from the enterprise which he had undertaken at the head of the Volscian armies, against his native city. It is now in ruins, but considerable fragments of it remain. At the seventh mile, the Claudian aqueduct crosses the way. In a vineyard at Castel Gandolfo, is an ancient tomb, which tradition assigns to Tullia, the daughter of Cicero.

The Alban lake is situated a little to the

left of the Appian road. Its modern name is Lago di Castello. The Emissario, if its antiquity is sufficiently ascertained, must be one of the most remarkable objects which have been saved from the ravages of time. It is said to have been erected three hundred and ninety-seven years before the Christian era, and is still in perfect preservation.

"This truly interesting monument of antiquity was constructed, as is well known, during the celebrated siege of Veii, for the emission of the superfluous waters of this lake which had risen to an astonishing height, when the country was afflicted with an uncommon want of rain, which occasioned a failure of almost all the lesser streams. The oracle of Delphos and those of Etruria having also declared that Veii could not be taken till the waters of the lake were carried off into the fields, and then confined into rivulets; the work was soon terminated, and Veii was taken.

"This 'Emissario' presents an arch of considerable height, seven feet in diameter, composed of large square stones. It forms the entrance of a channel which conveys the water under the hill on which Castel Gandolfo stands, about three hundred feet above the level of the lake.

"This channel is a mile and a half in length, and terminates in the fields near Albano, where is a mill for grinding corn, and the water afterwards runs into the Tiber, at a place called 'Aque Salvie.' There are sometimes five feet of water, and at others only two: by placing a lighted taper on a board, and letting it swim through the arch, the eye can follow the stream to a very considerable distance, and the board floats along the channel till it makes its appearance at the mill."

The present town of Albano, situated near the lake, derives its name, though its site is different, from the ancient city of Alba, a name closely connected with the origin of Rome:

'Albanique patres, atque altæ moenia Romæ.'

Among the numerous villas erected in the neighbourhood of Albano by the Romans, the most conspicuous was that of Pompey, of which considerable vestiges are still in being. "The remains of antiquity near Albano in all directions are very numerous. In a vineyard about a mile distant from the northern gate are vestiges of walls, which appear to have been built during the time of the republic, or during the reign of the first Cæsars. Six rooms with beautiful mosaic pavements were discovered here some years ago."

The small town of Palazzolo, on the east of the lake, and at the foot of the

Alban mountain, is supposed to present the site of the ancient Alba Longa. It is marked by some insignificant ruins.

Laricia, on the Appian road, about a mile from Albano, is the Aricia of antiquity, the seat of an Italian fable, beautifully described by Virgil, *Æn.* vii. 701—782.

"Ibat et Hippolyti proles pulcherrima bello
Virbius, insignem quem mater Aricia mi-
sit," &c.

This town appears to be distinguished by the beauty of its situation; and contains a fine modern palace, possessed by the family of Chigi.

The small lake of Nemi, about four miles in circumference, succeeds that of Albano at a short distance, lying also on the left of the Appian way. Gensano, said to be corrupted from Cyathianum, preserves the memory of the worship of Diana, celebrated in this territory, which was peculiarly consecrated to that goddess.

"In the principal street, which is not inconsiderable, is annually performed an exercise entitled *il Saraceno*. This takes place on the anniversary of their tutelar saint, and follows a race of Barbary horses, which is previously exhibited in the avenue before the palace. A long space of ground is enclosed by pales, ornamented with branches of trees; at one extremity is a figure representing a Moor in armour, with a sprig of laurel in his hand, and a silver star on his forehead. The magistrates place themselves on a scaffold erected for the purpose, and adorned with crimson damask fringed with gold. They sit as judges of the game.

"Young men on horseback, attended each by a running footman holding their lance, enter the lists, and, after making their obeisance to the magistrates and spectators, run full speed at the Saracen's head; and he whose lance strikes the star, or comes nearest to it, gains the prize, which is a silver knife, fork, and spoon, tied with red ribbands. This game was introduced by the Saracens, and is practised in other parts of Italy: it gives some idea of the warlike amusements of the Arabs, as described in the history of Granada, and other works translated from their language; but the traces of their magnificence and chivalry are still more visible in the Sicilian festivals."

The name of Nemi has descended from Nemus Aricinum; a grove of great celebrity, dedicated to Diana; in a situation of singular beauty. Naval combats were exhibited by the emperor Claudius on the lake; at the bottom of which, in the fifteenth century, a Roman vessel was dis-

boast, in addition to the charms of situation, objects highly deserving the observation of travellers, although many of our own nation; who visit Italy with a desire of treading that earth which their early studies have taught them to love and respect, either from want of time, or from not being sufficiently apprised of the scenes still worthy their attention, leave the country without having seen more than two or three of the little towns at a short distance from the capital; and perhaps, having passed only a few hours in each, have not had an opportunity of viewing even these with advantage."

The object, therefore, of the present work, is to give an account of the present appearance of the Campagna, of its ancient state so far as it is deducible from the remaining monuments of its former greatness, compared with the descriptions of the Latin writers; interspersed with many anecdotes of history connected with the subject, chiefly relative to the ancient and middle ages.

The topographical part of the work is preceded by an introduction, containing a description of the situation and climate of the Campagna; an account, so far as can be collected from the dark and uncertain traditions which have descended to us, of the original inhabitants and early colonists of Latium; and the cities, roads, and villas, of the ancients. The following is the description of the rural amusements of the present Romans, during their annual absence from the capital in the season of autumn, and especially in the month of October.

"Most of the nobility, and indeed all who are in easy circumstances, either possess or hire houses for this month, at one or other of the little towns within ten or twenty miles of the capital. This is called going into *villeggiatura*; and it forms one of the principal pleasures of their existence. They esteem it not only necessary for their health, but essential to their making a respectable appearance in society; and individuals who have not the advantage of possessing a *casino*, hire lodgings in convents or private houses, for as much of the month of October as their finances will allow.

"Ecclesiastics, lawyers, physicians, and others who dress as *abati*, in black, with short mantles over their shoulders, for the rest of the year, wear coloured coats during this month; and even cardinals change their usual habit for a purple frock. Towards the end of September every Roman appears with a countenance enlivened by the expectation of an agreeable *villeggiatura*, except the few whom business or want of money detains in the metropolis; and these endeavour to console themselves, by wearing the habit of *vil-*

leggianti, and walking in the beautiful villas and vineyards which surround the city.

"None, however, anticipate with so much ardour, or enjoy with so much avidity, the pleasures of the month of October, as the scholars, and we may add the masters, of the different colleges and seminaries in which Rome abounds. Each of these houses has a *casino* at or near one of the *cascetti*, as the little towns are usually denominated. On a happy day appointed for the change of habitation, a long train of coaches conveys the youthful *villeggianti* to the scene of delight where, under the eye of their preceptors, they join in all the amusements which the country affords. Their studies are not, however, totally neglected; for, besides the lessons they receive on mineralogy and botany during their excursions, it is remarked, that some of their best exercises are composed spontaneously at these seasons of recreation.

"The time of *villeggiatura* is indeed short, but that very reason contributes to render it more delightful. The mornings are usually employed in walks or friendly visits; in the evening, those who have carriages take airing; and afterwards, all assemble at one of the houses, where conversation and music for the young, and cards for the elderly engage their attention. On these occasions the nobility sometimes mix with those of inferior class, particularly where balls or concerts are given. Races, and other amusements appropriate to the country, form also part of their pleasures."

Deviating slightly in one or two instances from the order observed by the author, we shall proceed to give an analysis of the contents of this work under six principal heads.

1. The Appian way, and the adjoining objects. This celebrated road, one of the most remarkable monuments of Roman grandeur, in a species of public works the construction of which they excelled all nations ancient or modern, extends from Rome towards the south. One of the first objects which occurs, is the small temple of Fortuna Muliebris, at the distance of four miles from Rome; said to have been erected in honour of Veturia the mother of Coriolanus, and the Roman matrons who accompanied her, when her entreaties she prevailed on her son to desist from the enterprize which he had undertaken at the head of the Volscian armies, against his native city. It is now in ruins, but considerable fragments remain. At the seventh mile, the Claudian aqueduct crosses the way. In a vineyard at Castel Gandolfo, is an ancient tomb, which tradition assigns to Tullia the daughter of Cicero.

The Alban lake is situated a little

left of the Appian road. Its modern name is Lago di Castello. The Emissario, if its antiquity is sufficiently ascertained, must be one of the most remarkable objects which have been saved from the ravages of time. It is said to have been erected three hundred and ninety-seven years before the Christian era, and is still in perfect preservation.

"This truly interesting monument of antiquity was constructed, as is well known, during the celebrated siege of Veii, for the emission of the superfluous waters of this lake which had risen to an astonishing height, when the country was afflicted with an uncommon want of rain, which occasioned a failure of almost all the lesser streams. The oracle of Delphos and those of Etruria having also declared that Veii could not be taken till the waters of the lake were carried off into the fields, and then confined into rivulets; the work was soon terminated, and Veii was taken.

"This 'Emissario' presents an arch of considerable height, seven feet in diameter, composed of large square stones. It forms the entrance of a channel which conveys the water under the hill on which Castel Gandolfo stands, about three hundred feet above the level of the lake.

"This channel is a mile and a half in length, and terminates in the fields near Albano, where is a mill for grinding corn, and the water afterwards runs into the Tiber, at a place called 'Aque Salvie.' There are sometimes five feet of water, and at others only two: by placing a lighted taper on a board, and letting it swim through the arch, the eye can follow the stream to a very considerable distance, and the board floats along the channel till it makes its appearance at the mill."

The present town of Albano, situated near the lake, derives its name, though its site is different, from the ancient city of Alba, a name closely connected with the origin of Rome:

Albanique patres, atque altæ moenia Romæ.

Among the numerous villas erected in the neighbourhood of Albano by the Romans, the most conspicuous was that of Pompey, of which considerable vestiges are still in being. "The remains of antiquity near Albano in all directions are very numerous. In a vineyard about a mile distant from the northern gate are the remains of walls, which appear to have been built during the time of the republic, or during the reign of the first Cæsars. In the ruins of a room with beautiful mosaic pavement were discovered here some years

ago, a small altar, supposed to present the site of the ancient Alba Longa. It is marked by some insignificant ruins.

Laricia, on the Appian road, about a mile from Albano, is the Aricia of antiquity, the seat of an Italian fable, beautifully described by Virgil, *Æn.* vii. 761—782.

"Ibat et Hippolyti proles pulcherrima bello
Virbius, insignem quem mater Aricia mi-
sit," &c.

This town appears to be distinguished by the beauty of its situation; and contains a fine modern palace, possessed by the family of Chigi.

The small lake of Nemi, about four miles in circumference, succeeds that of Albano at a short distance, lying also on the left of the Appian way. Gensano, said to be corrupted from Cyndianum, preserves the memory of the worship of Diana, celebrated in this territory, which was peculiarly consecrated to that goddess.

"In the principal street, which is not inconsiderable, is annually performed an exercise entitled *il Saraceno*. This takes place on the anniversary of their tutelary saint, and follows a race of Barbary horses, which is previously exhibited in the avenue before the palace. A long space of ground is enclosed by pales, ornamented with branches of trees; at one extremity is a figure representing a Moor in armour, with a spray of laurel in his hand, and a silver star on his forehead. The magistrates place themselves on a scaffold erected for the purpose, and adorned with crimson damask fringed with gold. They sit as judges of the game.

"Young men on horseback, attended each by a running footman holding their lance, enter the lists, and, after making their obeisance to the magistrates and spectators, run full speed at the Saracen's head; and he whose lance strikes the star, or comes nearest to it, gains the prize, which is a silver knife, fork, and spoon, tied with red ribbands. This game was introduced by the Saracens, and is practised in other parts of Italy: it gives some idea of the warlike amusements of the Arabs, as described in the history of Granada, and other works translated from their language; but the traces of their magnificence and chivalry are still more visible in the Sicilian festivals."

The name of Nemi has descended from Nemus Aricinum, a grove of great celebrity, dedicated to Diana, in a situation of singular beauty. Naval exercises were exhibited by the emperor Claudius at the lake of Nemi.

A small town of Palestrina, on the

covered. The fountain of Egeria remains under the name Fonte Gerulo.

Ardea, the capital of Turnus, is on the right of the Appian road, not far distant from the sea. It is frequently mentioned in Roman history; but appears in the flourishing ages of the republic to have been deserted, and is now very thinly inhabited, on account of the insalubrity of the air.

Civita Lavinia is the ancient Lanuvium, of which Milo was dictator. "The town is very interesting, every thing bearing marks of the most remote antiquity. Many beautiful fragments of ornamental sculpture in stone and marble, lie scattered about in the streets; and in most of the walls are stuck pieces of cornices or columns."

Velitræ is the last-mentioned town in this route, lying on the modern road to Naples, twenty-six miles distant from Rome. It is celebrated for the birth, or at least the education, of Augustus; but appears to be more distinguished by its modern palaces, than its remains of ancient edifices. The Pontine marshes are in its vicinity.

2. Towns and objects on the coast. At the mouth of the Tiber are situated Porto and Ostia; the former on its right, the latter on its left bank. These places retain some traces, though not very considerable, of their former maritime importance. The remains of the ancient Claudian port are visible under water on a calm day. The magnitude of this work may be estimated from the descriptions of Juvenal and Suetonius.

Torre di San Lorenzo, about seven miles to the south of Ostia, is conjectured to represent Laurentum, the city of Latinus. Of the villa of the younger Pliny, situated near this town, it does not appear that any remains are extant. Heyne, in his third *Excursus* on the seventh book of the *Æneid*, controverts the claims of San Lorenzo to the honours of ancient Laurentum; he concurs with Cluverius and Fabretti in fixing it at Torre di Paterno. Lavinium, the first seat of the supposed monarchy of Æneas in Italy, is supposed to have stood on a little eminence at the source of the river Numicus; about three miles from the sea.

The vicinity of Antium is still interesting. The ancient name is preserved in the present Porto d'Anzo; while the adjacent maritime town of Nettuno gives testimony to the temple and worship of the deity of the sea, by which this place

was celebrated. Antium was the capital of the Volscians, and was not reduced, till after many contests, under the power of Rome. Under the empire it was distinguished by the splendour of its buildings. Among its public edifices, the temples of Neptune, Æsculapius, and Fortune, were eminent. To the latter Horace alludes in the well-known ode which he addresses to the mutable goddess:

"O Diva, gratum quæ regis Antium!"

Some of the master-pieces of sculpture, particularly the Belvedere Apollo, were discovered among the ruins of this city.

Monte Circello, a bold eminence, projecting into the sea, and connected with the continent by a low and narrow neck of land, is the ancient *Æea*, or island of Circe. It is not improbable that, in remote ages, it may have been actually separated from the shore. Classic superstition points out the tomb of Elpenor with as much exactness, as in Palestine religious superstition assigns the situation of every remarkable event connected with the origin of Christianity.

3. Tusculum, with the surrounding country. No name can be dearer than this, to the admirers of ancient genius and learning. It was to this favourite retreat that Cicero withdrew from the business and turbulence of Rome, to enjoy the elegant pursuits and calm satisfactions of literature and philosophy, in secret study, or in the society of friends of taste and attainments similar to his own. From some remains of antiquity which have been there discovered, it is conjectured, though rather precariously, that the monastery of Grotta Ferrata presents the exact site of Cicero's villa. The modern name of Tusculum is Frascati. The ancient city was on an eminence, at the foot of which the present town is built. The nominal cardinal of York is bishop of this diocese, in which he usually resides.

Lucullus possessed a splendid villa in the vicinity of Tusculum. "Considerable vestiges of porticos, grottos, and other buildings, in which inscriptions with the name of Lucullus have been found, occur frequently between Marino and Monte Porzio, above Frascati; but it is impossible to distinguish how much of these buildings belonged to Lucullus, or to discover how many other dwellings were erected on the ruins of his villas, or near them, during the course of so many centuries."

The monastery of Grotta Ferrata is remarkable for the use of the Greek ritual.

"The service is performed in Greek; and the Missal and book of Psalms, printed in that language with accents, are read and sung by the monks according to the modern pronunciation. They are chiefly Calabrians of respectable families; their hospitality is great; and on the 8th of September, the day of the Madonna, when a fair is held under the elms before the abbey, they entertain some of the first nobility of Rome with great propriety. In the court of the monastery are then erected shops and booths, where linen, shoes, fans, and trinkets are sold: little arbours are formed of branches of trees (in which art the people of Frascati excel), and others, of a larger dimension, for dinner-parties in the meadow: horses, oxen, and indeed cattle of all descriptions, are brought hither to be sold; and the meadow is filled with company of all ranks, whose various dresses, with the picturesque appearance of the place in general, compose a scene of the most agreeable and cheerful nature. Music is always introduced on these occasions, and at night the lamps, placed on the different tables where the people are assembled in convivial parties, sparkle between the trees, and give an appearance of festivity which is truly delightful. Between ten and eleven in the morning of the great day (for most of the people assemble on the eve), high-mass is sung in Latin, as well as Greek, by the regular father abbot of the monastery with a mitre and crosier, which he has the right of wearing on this occasion; his dress, and those of the other officiating priests, are magnificent. The abbey is in the diocese of cardinal York, as bishop of Frascati."

4. The description of the Alban mountain we present entire.

"MONTE CAVO, MONS ALBANUS.

"Ascending from this place to the summit of *Monte Cavo*, anciently *Mons Albanus*, at the distance of little more than a mile, the traveller follows a most difficult path over rocks, whence the views are surprisingly extensive and beautiful; the lake of Albano appearing at his feet. Above *La Rocca* are the ruins of some Gothic buildings, and the peasants suppose them to have been once a fortress; which is highly probable, from the many advantages of the situation. The road now opens into a large plain nearly enclosed by a circular chain of mountains, amongst which the most remarkable is Mount *Algidum*. This place bears the name of the plains of *Hannibal*, as it is imagined to be the spot whence that general pointed out to his army the city of Rome, and promised to his officers, for the ensuing evening, a supper in the Capitol: others place it lower.

"From this plain we ascend a most enchanting road shaded by a variety of trees,

and particularly by oaks and laurels. It leads winding up to the summit of the mountain. This road is of the time of the republic, and near the summit is in perfect preservation: it commences round that part of the hill nearest Albano, and is composed of large flat stones, supported on each side by a pavement about a foot higher: it is broad enough for the passage of a modern carriage: in many parts of it are seen engraved the two letters V. and N., which antiquaries interpret *Viu Numinis* (the road of the deity).

"Hither the Roman conquerors used to come a few days after their triumph, to offer up a sacrifice of thanks in the temple of Jupiter *Latialis*; and those who, after having gained a victory, could not obtain from the senate the decree which entitled them to the honour of a triumph, often made one at their own expence in this place, followed by their army, with a pomp equal to that of Rome.

"This temple of Jupiter was the object of general veneration: in the first times of the republic the different states of Latium sent annually hither deputies to renew their league of amity, and offer up a sacrifice to Jupiter. On a stated day they met in this place, and each deputy partook of the victim. The Romans considered it as the chief object of their devotion after the Capitol: and prodigies supposed to happen here were expiated with the most rigorous superstition. That singular appearances should strengthen their belief in such wonders is not astonishing, when we consider the volcanic nature of this celebrated mountain. The Alban lake was the crater of a volcano; and the accounts given by Livy, and other historians, of its having rained stones, and other similar phenomena, on Mount Albano, are as easy to be explained by naturalists, as the death of *Acis* and other mythological events, the scene of which was the neighbourhood of Mount *Etna*.

"Arriving at the summit of *Monte Cavo*, it is impossible not to experience sensations at once awful and delightful; the recollection of the important events which led the masters of the world to offer up at this place their homage to the Deity, is assisted by the great quantity of laurels still growing here.

"It is a small plain belonging to an order of friars called *Passionisti*, who subsist well on the charity of the circumjacent towns and villages. Their dress is black, with a large red cross on their breast, and they are under the protection of cardinal York, who assisted them in building a new church in the year 1784. Their convent is a building of considerable size, and opposite to it is a stone table shaded by two fine chesnut-trees; this is supposed to have been the place of the altar of Jupiter, as it is in the centre of the plain, and great part of a circular wall of some extent is yet visible, and was, no doubt, that of the ancient temple. On the ground were seen several fragments of cornices of good sculpture; and, when we were on the hill,

the masons were employed in making a shell for holy water out of part of an antique altar.

"There are two moments in which this spot is more peculiarly interesting. One, on a clear day, when the eye can enjoy the most extensive and the sublimest view that is known in the papal dominions. It takes in a vast tract of country, and a large portion of the Mediterranean, with the various objects which render this scene one of the noblest in the world. It almost extends to the Adriatic, and comprehends part of the Neapolitan territory, with a long chain of the Appenines.

"The other moment, though not so beautiful, has in it something extraordinary and awful that is truly deserving of observation. It is, however, frequently a great disappointment to many travellers. A mist covers the whole of the prospect below, and the circular plain alone is visible to the person who has ascended the hill in search of the view. It has then the appearance of an island in the midst of an immense lake, or of an edifice seated on the clouds. This mist scarcely ever extends its influence to a great distance. It appears, when seen from Albano, or any other town on the borders of the lake, in the form of a cloud which cuts across the upper part of the mountain, and is an indication of future rain. This gives rise to the expression, '*Monte cavo ha il capello—piovera*':—'The mountain has put on his hat—it will rain:' an expression which, probably, comes from the ancient Romans, as there is a mountain in France corruptedly called *Mont Piliu*, from *Mons Pileatus*, the Roman name given to it on account of its frequently appearing with this cloud across or above the summit.

"An excursion to Monte Cavo is not only pleasing to the painter and antiquary, but affords specimens of many curious volcanic productions to the mineralogist.

"The *ferie Latine* were annual meetings of the states of Latium with the Romans, Hernici, and Volscians, established by Tarquin the Proud, who was desirous, by this arrangement, to make himself master of these several nations, and was too good a politician not to understand the use of festivals and banquets.

"Forty-seven cities partook of this feast, and each contributed its portion, by sending lambs, cheeses, milk, or other provisions. The common victim was an ox, a portion of which was given to the deputy of each town, the Romans presiding at the sacrifice.

"Only two communities of the Volscians, the Antiaties and the Echetraai, consented to join this assembly.

"The name of *ferie*, which properly implies holidays, has remained to public meetings of a different nature, called by the Italians *fiera*, and by us *fairs*.

"As there was not space sufficient for so numerous a company on the summit of Mount Albano, it is probable these *ferie* were held in the spacious plain above described, under

the name of the *fields of Hannibal*; although the bull might be sacrificed at the temple of Jupiter Latiaris, and the forty-seven deputies might partake of it there. The plain is about three miles in circumference, and produces excellent pasturage; the mountains encircling it are covered with trees, and the oaks are some of the finest in this country.

"On the side of the Alban mountain stood a temple of *Juno Moneta*, erected by Caius Cicerius, in consequence of a vow he made in Corsica, where he gained a considerable victory in the year of Rome 578, destroying 7000 of the enemy, and taking 1700 prisoners. This temple was completed in 583, and was afterwards supposed miraculously to turn from the east to the north. It was not large, but appears to have been held in great veneration."

5. Præneste. This town, now called Palestrina, is distinguished by its antiquity, and by various circumstances of its history. The salubrity of its air, and the beauty of its situation, rendered it a favourite residence of the wealthy Romans. One of its most remarkable edifices was the temple of the goddess Fortuna, said to have occupied nearly the whole of the ground on which the present town of Palestrina stands, erected by Sylla on the scene of his greatest victory, in honour of the goddess by whose protection and regard he considered himself as peculiarly distinguished. The finest building of the modern city, is the castle or palace of its prince.

"The chief object of curiosity is the palace of the prince, in the highest part of the city, to which there is an ascent by an excellent coach-road to the right, by the Capucia convent, without entering the narrow street. Before it is a level space of considerable length, which formed the highest platform of the temple of Fortune.

"Two flights of steps lead to an amphitheatre, or semicircular staircase, in excellent preservation, which is the same that led to the sanctuary of the temple, on the foundation of which the palace is built: in the middle of the semicircle is a well; each step is about a foot and a half high (like the ancient steps of the capitol which led to the church of Ara Cœli, at Rome). Another short flight conducts to the hall of entrance, where are seen four elegant bronze cannons, a double staircase, and a recess, closed by iron grates, which contains the celebrated antique pavement, of which Pliny speaks in the following terms:

"The fine mosaic of small stones, placed by Sylla as a pavement in the temple of Fortune at Præneste, was the first thing of the kind seen in Italy.

"There does not seem to be the smallest room to doubt of this being the genuine mo-

hair he mentions: it is in excellent preservation, and appears to be about twenty feet by sixteen. It was found in the same cellar of the seminary, where is still the altar of Fortune, and may be considered as one of the most interesting relics of antiquity.

"Towards the upper part of it are mountains, with negro savages hunting wild beasts; animals of different sorts, with their names in Greek written below them—such as rhinoceros, crocodile, and lynx. Lower down are seen houses of various forms, temples, vessels of different constructions, particularly a gallery of 32 oars, manned with armed blacks, and commanded by a white man; a tent with soldiers, a palm-tree, flowers, a collation in an arbour, an altar of Anubis; in short, almost every circumstance imaginable in life. The scene apparently lies in Egypt. The figures are well drawn, the light and shadows happily disposed, and the colouring harmonious. The stones which compose this very curious pavement are remarkably small, which renders the effect peculiarly pleasing from the neatness of its appearance."

"This immense and magnificent building has not been inhabited for many years, and indeed it is much too large for the present modes of life. The length of it is 572 feet."

The towns of Gabii, Pedum, and Scaptia, with others in the vicinity of Præneste, do not appear to be much distinguished by any traces of ancient splendour.

6. Tibur, now called Tivoli, is well known as one of the most delightful situations in the environs of Rome, celebrated by its ancient poets, and the chosen resort of many of its most eminent citizens. In no place are the remains of ancient villas so numerous. One of its most beautiful objects is the celebrated cascade.

"From this place there is a steep descent to a grotto near the great cascade, the beauty of which baffles all description. It is called *La Grotta di Nettuno*. On the way are to be seen different petrefactions.

"Besides the great cascade, which is near the sybil's temple, there are smaller ones called *la cascettella grande*, and *le cascatelle piccole*; the last are near the villa of Mænas, and the other is at the extremity of the valley, and, at a certain hour, forms a beautiful rainbow: near it is a natural grotto, in which are three compartments; a little garden before it leads down to the cascatella. The light spray of the water, which the inhabitants call *the dust of the cascades*, keeps up a de-

lightful coolness in the valley; and is very beneficial to the variety of flowers and shrubs which grow wild on the banks of the Tevere; the majestic and interesting ruins, the various trees, and verdure of the grass, the murmur of the waters, and the sublimity of the sheltering hills, give a mingled sensation of awe and delight, which it is impossible to describe."

Among the villas of distinguished Romans are enumerated those of Centronius, Piso, Cassius, Adrian, the Cæsonian family, Mænas, Varus, Ventidius Bassus, Munatius Plancus, Rubellius, Horace, and Catullus. Tibur also afforded a retreat to two royal captives, Syphax and Zenobia. Of the villa of Adrian, a building of great extent and sumptuous magnificence, considerable ruins are still remaining.

Near Vicovaro, at the distance of six miles from Tivoli, is San Cosimato, "a large convent of reformed Franciscans, in the most romantic situation imaginable, and highly celebrated for the beauty of its prospects." It stands on the banks of the Tevere, the ancient Anio. "On the opposite side is a steep ascent to a wood which covers the summit of a hill: the friars rarely venture to walk in it, as they know it is infested by wolves of an enormous size, descended no doubt from those described by Horace; and as they are not allowed to divert their fears by musing on the attractions of a Lalage, they prudently confine themselves to the safer bank of the Tevere, and count their beads to the hoarse murmur of its waves, in one of the wildest spots that is to be seen in this part of Italy."

This volume is very creditable to the taste and diligence of the author, and will be found useful in imparting to the classical scholar distinct and accurate ideas of the natural features and the antiquities of a country rendered interesting to him by its connection with the objects of his studies. The orthography of the word *Filostratus* leads us to suspect an Italian origin for some of the information conveyed. The materials have, however, been well employed, and evidently directed by personal observation. The work is illustrated by twenty etchings, delineating the most remarkable objects which it describes.

ART. X.—*The Periplus of the Erythrean Sea. Part the Second: containing an Account of the Navigation of the Ancients, from the Gulph of Elana, in the Red Sea, to the Island of Ceylon. With Dissertations.* By WILLIAM VINCENT, D. D. 4to. pp. 650.

WE are happy to congratulate the public and the author on the appearance

of the second and concluding volume of this valuable and laborious work.

Arabia and India are the subjects of the third and fourth books. The unknown author of the *Periplus of the Erythrean Sea*, printed among the minor Greek geographers, furnishes the text, which is illustrated by a great variety of geographical and commercial information, collected by the learned author from numerous sources both ancient and modern.

"The commerce of the ancients between Egypt and the coast of Africa, with all that concerns their discoveries to the south, has been traced in the preceding pages; and we now return again to Egypt, in order to take a fresh departure, and prosecute our inquiries till we reach their final boundary on the east. The present book will comprize all that concerns the commerce of Arabia, both in the interior, and on the coast.

"The *Periplus* is still to form the basis of our investigation; but as the object proposed is to give a general account of the communication with the east, no apology is requisite for detaining the reader from the immediate contemplation of the work itself. A variety of scattered materials, all centring at the same point, are to be collected, before a comprehensive view can be presented, or an accurate judgment formed; and if this task can be executed with the fidelity and attention which the nature of the subject requires, the general result will be preferable to the detail of a single voyage, in the same proportion as a whole is superior to its parts.

"The commencement, then, of this second voyage is again from Berenikè, and from this port there were two routes practised in the age of the author; one, down the gulph to Mooza and Okèlis direct, and the other, first up to Myos Hormus, and then across the gulph by the promontory Pharos, or Cape Mahomed, to Leukè Komè in Arabia. This latter route is the immediate object of our consideration."

The first position discussed is that of Leukè Komè, or the white village. Leukè Komè was one of the marts established by the ancients for the trade of the Red Sea. The following is the account given of it by the ancient geographer. "It was the point of communication with Petra, the capital of the country, the residence of Malichas the king of the Nabatæans. Leukè Komè itself had the rank of a mart with respect to the small vessels which obtained their cargoes in Arabia; for which reason there was a garrison placed in it, under the command of a centurion, both for the purpose of protection, and in order to collect a duty of twenty-five in the hundred."

Such is the account given of the state of commerce in this place under the Ro-

mans. At an earlier period, when the communication with Egypt was in the hands of the Arabians themselves, Dr. Vincent conceives it to have been much more flourishing; as Petra, the inland capital, was the centre of a trade, branching in every direction, to Egypt, Palestine, and Syria, through Arsinoë, Gaza, Tyre, Jerusalem, and Damascus, Arabia being at a very early age the common channel of oriental commerce.

Petra the metropolis, of which Leukè Komè was the port, appears to have been the point to which all the Arabian traffic tended. To this mart is to be referred all that we hear of the commerce of the Ishmaelites, of Idumea, Nabatea, or Arabia Petræa. Several traces of the mercantile wealth of this district occur in the Scriptures. "In the reign of David, Hadad, the prince of Edom, was driven out, and Hebrew garrisons were placed in Elath and Ezion Geber, where Prideaux supposes that David commenced the trade of Ophir, which was afterwards carried to its height by Solomon."

Dr. Vincent takes this opportunity of briefly stating his opinion respecting the much agitated question of the situation of Ophir, the source of Jewish wealth under the prosperous reign of Solomon.

"And here, perhaps, it will be expected that the trade to Ophir should be examined, which has so much divided the opinions of mankind, from the time of Jerom to the present moment; but as I have nothing decisive to offer upon the question, I shall only state my reasons for acceding to the opinion of Prideaux and Gosselin, who confine it to Sabæa.

"For I neither carry Ophir to Peru with Arias Montanus, or to Malacca with Josephus, or to Ceylon with Bochart, because I consider all these suppositions as founded upon no better evidence than the finding of gold in those countries; but our choice must lie between the coast of Africa and Sabæa. Montesquieu, Bruce, and d'Anville, have determined in favour of Africa, principally, I think, because gold has always been an export from that country, while the precious metals were usually carried to Sabæa, to purchase the commodities of the east. I allow great weight to this argument, and I admit the probability of d'Anville's supposition, that the Ophir of Arabia might naturally produce an Ophir on the coast of Africa, which should, by an easy etymology, pass into Sophir, Sophar, Sopharah el Zange, or Sophala: but I by no means subscribe to the system of Bruce, which he has displayed with so much learning and ingenuity; and which he thinks established by the discovery of an anomalous monsoon prevailing from Sofala to

Melinda. A sensible writer has denied the existence of any such irregularity, and appeals to Halley, Parkinson, and Forrest; and if the irregular monsoon is annihilated, nothing remains in favour of his hypothesis but the duration of the voyage. The duration it should seem easy to account for, upon a different principle; for the navigators were Phenicians, and we learn from Homer their method of conducting business in a foreign port. They had no factors to whom they could consign a cargo in the gross, or who could furnish them, on the emergence, with a lading in return; but they anchored in a harbour, where they were their own brokers, and disposed of their cargoes by retail. This might detain them for a twelvemonth, as it did in the instance to which I allude; and if the Phenicians traded on the Eastern Ocean, as they did in the Mediterranean, we may from this cause assign any duration to the voyage which the history requires.

"But my reasons for adhering to the opinions of Prideaux and Gosselin are, first, that Ophir is mentioned with Havilah and Jobab, all three sons of Joktan: and all of these, as well as Joktan, have their residence in Arabia Felix, most probably beyond the Straits; and secondly, because the voyage to Ophir seems in consequence of the visit of the queen of Sheba to Jerusalem: it is immediately subjoined to it in the same chapter; and Sheba is Sabæa, or Arabia Felix, as we learn with certainty from Ezekiel. It is particularly added, that the royal visitant brought a present of spices: "there were no such spices as the queen of Sheba gave to Solomon."

"I do not wish to conceal an objection to this supposition; which is, though they are taxed, that spices are never mentioned as an article of importation from Ophir. The produce of the voyage is gold, silver, ivory, almug-trees, apes, peacocks, and precious stones. But as on the one hand this failure in the invoice will argue much more forcibly against any of the more distant Ophiirs which have been assumed; so on the other, it is no proof against Sabæa, that several of these articles are not native; for these, and many more than are enumerated, would certainly be found in Sabæa, if the Arabians were navigators in that age, as we have every reason to suppose they were.

"The evidence that Solomon obtained gold from Arabia is express; and as our early authorities notice gold as a native produce among the Debæ of Hejaz, so may we conclude that the gold of Africa always found its way into Yemen through Abyssinia, as it does at this day. The import of gold, therefore, we carry up as high as the reign of Solomon, and bring it down to the time of Ptolemy Philadelphus, king of Egypt; for we learn, from the testimony of Ezekiel and Aristæus, that spices, precious stones, and gold, were brought by the Arabians into Judea. I do not wish to lay more stress upon

this testimony than it will bear; but it is not unreasonable to suppose, that the circumstances of this commerce were similar, in an early age, to those of a later period. The removal of these difficulties will shew the inducement which persuades me to join in opinion with Prideaux and Gosselin, upon a question that has been more embarrassed by hypothesis, and distracted by erudition, than any other which concerns the commerce of the ancients."

A catalogue of the sovereigns of Idumea is collected from Josephus, from the year 309 B. C., till 36 after the christian æra. The period when a Roman garrison was introduced into Leukè Komè is uncertain. Petrea was reduced into the form of a Roman province under the reign of Trajan. The capture of Hagjr, probably the Hagar of the Hebrews, and Petra of the Greeks, was "the first successful attempt of the Mahometans beyond the limits of the Hejaz, and the prelude to the conquest of Syria by the immediate successor of the Prophet."

The fourth section specifies six different courses of the ancients in the Erythrean sea, mentioned by their historians or geographers.

"I. The first is the voyage, described in the two previous books, down the coast of Africa to Rhaptum; shewing that the Arabians had settlements in that country, before it was visited by the Greeks from Egypt.

"II. Secondly, we are informed of the two distinct courses within the gulph: one from Myos Hormus, across the head of the gulph to Leukè Komè, and thence down the Arabian coast to Mooza; and another, from Berenikè to the same port direct.

"III. Next to this, we collect a voyage from the mouth of the straits along the southern coast of Arabia into the gulph of Persia, extending afterwards to Bahrein, El Katif, and Oboleh, in the Shat-el-Arab.

"IV. Then follows a passage from the straits to India by three different routes: the first, by adhering to the coasts of Arabia, Karmânia, Gadrôsia, and Scindi, to the gulph of Cambay; the second, from Cape Fartaque, or from Ras-el-had, on the Arabian side; and the third, from Cape Gardéfán, on the African side, both across the ocean by the monsoon to Muziris, on the coast of Malabar.

"V. After this, we must allow of a similar voyage performed by the Indians to Arabia, or, by the Arabians to India, previous to the performance of it by the Greeks; because the Greeks, as late as the reign of Philomèter, met this commerce in Sabæa.

"VI. And lastly, we obtain an incidental knowledge of a voyage which confirms all that has been advanced concerning the early commerce of the Arabians, previous, in all

appearance, to every account we receive from the Greeks, and conducted, certainly, by the monsoon, long before Hippalus introduced the knowledge of that wind to the Roman world.

"It is the voyage between the opposite coasts of India and Africa, connected certainly with the commerce of Arabia, but still capable of being considered in the abstract, and proving, in my opinion at least, the possible existence of this intercourse in ages antecedent to all that history can reach. If it could be believed that the natives of India had been navigators in any age, we might more readily admit their claim in this instance than in any other; for the author mentions, that the imports into Africa are the production of the interior, from Barugaza and Ariake; that is, from the coast of Cambay and Concan: and the articles specified confirm the truth of his assertion; for they are, rice, ghee, oil of sesamum, cotton, muslins, sashes, and sugar: these commodities, he adds, are brought sometimes in vessels destined expressly for the coast of Africa; at other times, they are only a part of the cargo out of vessels which are proceeding to another port. Thus we have manifestly two methods of conducting this commerce, perfectly distinct: one to Africa direct; and another, by touching on this coast, with a final destination to Arabia. This is precisely the same trade as the Portuguese found at Melinda and Quiloa, and the same connection with Arabia; and this is the reason that the Greeks found cinnamon, and the produce of India, on this coast, when they first ventured to pass the straits, in order to seek a cheaper market than Sabæa. Still it must be doubted, whether this commerce was conducted by natives of India, or Arabians; for Arabians there were on the coast of Malabar, and in such numbers at Ceylon, that Pliny represents them as masters of the coast, like the Europeans of the present day, who have confined the native sovereigns to the country above the Ghauts, and have possessed themselves of the level towards the sea; such also was their situation, though under the name of Moors, or Mahometans, when the modern Europeans met with them again upon their arrival at Calicut, where their influence over the native government long counteracted all the power of the Portuguese."

If Arabia presented, at an early period, the principal channel of communication between the eastern and western worlds, it is natural to suppose that it must have participated in that wealth which has always been the attendant of Indian commerce. The fact is, that the wealth of Arabia is proverbial among the ancient writers. A remarkable circumstance by which the disposal of their riches was distinguished, is thus considered by Dr. Vincent.

"But there is still one point in which the Arabians are essentially distinguished from all the surrounding nations, which, through their means, partook in the commerce of the east; which is, that however ostentation their neighbours might be, the riches of the Arabians were all applied to their private luxury and indulgence. In Persia, and Chaldæa, those vast public works and edifices arose, which astonished the travellers of the ancient world; and in Egypt, the ruins of the Thebaid are an equal cause of amazement at the present hour. In a secondary rank, Tyre, Jerusalem, Baalbeck, and Palmyra, surprise us with their magnificence; while in Arabia, history speaks only of one public work, which was the Tank at Marîba; and when the head of that once failed, there never was sufficient industry or public spirit in the country to restore it.

"No adequate cause is assignable for this national distinction, but that spirit of independence which broke the body of the people into parts too minute for a combination of interests, and too diffuse for co-operation. This spirit was never counteracted but for a short time by enthusiasm; and no sooner was that exhausted by evaporation, than they returned again to the state in which they are described by the ancients. They are still a nation of merchants and marauders, incapable of subjection, not less from their temper and habits than from the nature of their country; rarely formidable in a body, from their mutual jealousy and distrust; indifferent soldiers, but dangerous partizans.

"No other reason is discoverable, why a nation that at one time possessed almost exclusively the commerce of the east, never arrived at a character of dignity and respect; and no other cause can I trace, why Idumæa became so easy a conquest to the Hebrews, Tyrians, Babylonians, and Romans. It is the influence over their government, and the possession of their harbours on the Red Sea by the Romans, which is now to be investigated; and if the command of the commerce obtained by this power continued with little interruption till the time of Justinian, and was not annihilated till the irruption of the Mahomedans, it is a duration of this commerce in one channel, longer than has fallen to the lot of any other people in whose hands it has been placed."

Leukè Komè, as we have before mentioned, was the port of Petra. Its situation is differently fixed by different writers. D'Anville places it at Haür, about three hundred miles from the head of the Eilatitic gulph. To this it is objected by Gosselin, that Haür, at the distance of three hundred and fifty miles from Petra, would not afford a ready communication with that capital, and could not be within the limits of Petrea.

M. Gosselin fixes upon Mislah, in lat.

27° 50', "to which he is perhaps more particularly directed, by finding a name of notoriety, in a situation that is probable." A fact mentioned by Agatharchides, which may be considered as decisive if that author be accurate, induces Dr. Vincent to place Leukè Komè at the mouth of the bay of Acaba, the Elanitic gulph of the ancients, a situation which agrees with that of Moilah in several maps.

"This author, at the entrance of the Elanitic gulph, has three islands: one, sacred to him; and the two others called Sookabûa and Balydô. These islands, after having been lost for twenty centuries, have been restored to geography by M. Irwin. He is the only voyager, as far as I can discover, who has ever entered this bay; and if his chart may be depended upon, he went up it five-and-twenty miles: in consequence of this he saw these islands, and has named them Tirân, Sanafir, and Barkan. I have never seen them in any chart, previous to his, arranged in the same order: but they bear such testimony to the fidelity of Agatharchides, that he deserves credit when he adds, that 'they cover several harbours on the Arabian shore' [as the Zaffa, ten islands protect the port of Myos Hormos]; and one of these harbours, I conclude, must be the Leukè Komè of the Periplus; for he adds, 'to these islands succeeds the rocky coast of the Thamudeni, where, for more than a thousand stadii, there is no harbour, no road where a vessel can anchor, no bay to afford protection, no scrap of a projecting point, to which the mariner can fly for refuge in a moment of distress.'

"However the colouring of this picture may be heightened, the general description is true, as may be seen by a reference to M. Irwin's Journal, from the 22d of June to the 9th of July; where we have every day islets, breakers, shoals, sands, and sunken rocks, with the mention of only one cove where the shore could be approached. The refuge his Arabian boat found, was generally under islets; but a navigator who did not dare approach the shore, might well paint it in the same colours as Agatharchides has done. Irwin carries Moilah fifty miles more to the north than it appears in other charts, and within the Elanitic Gulph: if this be true, my conclusion is perfectly in correspondence with that of M. Gosselin; and if, by taking different methods, we both arrive at the same conclusion, it must be a strong confirmation that the point we have both fixed on is right; for a safe anchorage at Moilah, covered by the islands, and the unapproachable nature of the coast below, fix Moilah to a certainty for the Leukè Komè of the ancients."

From Leukè Komè to the mouth of the straits, a course of more than a thousand miles, only two places are mentioned, the Burnt island and Moosa. We have

here an analysis of the unfortunate expedition of Elius Gallus, on which however our limits will not permit us to dwell. 'The passage from Leukè Komè to the Burnt island, was conducted with a view of avoiding the coast throughout.' Gebel Tar, which now presents volcanic appearances, is marked in the chart as probably corresponding with the Katakekaumene of the ancients. Moosa was the mart of the southern tribes of Arabia, on the shores of the Red Sea. The mart of Yemen at present is at Mokha. 'Twenty miles inland from Mocha, Niebuhr discovered a Moosa still existing, which he with great probability supposes to be the ancient mart, now carried inland to this distance by the accretion of the coast.' A curious commercial table of the imports and exports at Moosa is extracted from the Periplus.

Okelis is situated on the straits; its present name is Ghella.

We now reach the straits of Babelmandel. The author here inserts a tabulated arrangement of the positions afforded by Ptolemy for the eastern side of the Arabian gulph, compared with Agatharchides, Diodorus, Strabo, D'Anville, Gosselin, and the author of the Periplus.

The first station occurring on the southern shore beyond the straits, is a village, to which the provincial name of Arabia Felix is applied. This, from the circumstances of the description, is supposed to be represented by the modern Aden.

The principal circumstance on which the arrangement of the geography of the Arabian coast on the ocean depends, is the position of Syagros. In the map of D'Anville, Syagros represents the modern Raselhad, the most eastern promontory of Arabia. With this common hypothesis, Dr. Vincent formerly coincided, 'and so much is there,' says he, 'to induce this opinion, that I abandoned it with great reluctance, and shall perhaps find great difficulty in persuading others that it is erroneous.'

"The Periplus notices Syagros as pointing to the east, and as the greatest promontory in the world. Omaa likewise is mentioned with it, answering to the present Oman; and Moscha, seemingly identified with Maskat, the principal port of that province. Under the influence of these resemblances and probabilities, if I had joined in the common suffrage, and called Syagros Ras-el-had in my former publications, wherever it occurred, it is conviction alone, and the abandonment of system for truth, which compels me to recall the error, and acknowledge that Syagros is not Ras-el-had, but Fartaque.

"This is a concession not made for the purpose of particular accommodation, but grounded on a general analysis of all the positions on the coast, on a combination of all the circumstances relative to the division of the provinces; and upon a painful re-consideration of all that was to be undone, and unsettled, after I had fixed my opinions upon the authority of the best writers, who had preceded me on the subject.

"The reader will expect proofs; and the proofs are, that the islands round the whole extent of the coast on the ocean will now fall naturally into their places, which cannot be effected by any other arrangement. The islands in Ptolemy will become relatively consistent with those of the *Periplus*; and the Bay Sachalites, which Ptolemy has been accused of transposing from the west to the east of Syagros, is reduced to the different application of a name, instead of a difference in point of situation.

"Sachalites is universally allowed to be the Greek form of expressing the Arabic Sahar. Now there are two Sahars on the coast of Arabia: one that is almost central between Aden and Fartaque; and another that lies to the east of Fartaque, between that cape and Cape Morebat or Merbat. In the first of these there is little variation of orthography; but the other is written Schahr, Schahr, Shahar, Cheer, and Seger. They are both frequented as places of trade to this day. And if we suppose that the first Sahar is the Sachalites of the *Periplus*, and the second Shahar the Sachalites of Ptolemy, the Syagros of Ptolemy will answer to Fartaque, as well as the Syagros of the *Periplus*, and the two authors will be in harmony with each other."

The port which succeeds Aden is that of Kanè, at the distance of two thousand stadia or more. Kanè is probably the modern Cava Canim.

In Section xrv, entitled, The Bay Sachalites, some fresh proofs are adduced of the identity of Syagros and Fartaque, particularly the relation of that promontory to the island Dioscorida, or Socotra, which appears to be a decisive circumstance.

The only difficulty which encumbers the position of Syagros at Fartaque, arises from the following passage of the *Periplus*. 'Adjoining to Syagros, there is a bay which runs deep into the mainland of Omana, six hundred stadia in width; after this, there are high mountainous rocks, steep, and inhabited by a [wild] race, that live in caverns and hollows of the cliff. This appearance of the coast continues for five hundred stadia more, at the termination of which lies a harbour called Moskha, much frequented on account of the Sachalitic incense which is imported there.'

It is the mention of Moskha and Omana, observes Dr. Vincent here, that necessarily suggests the idea of Maskat, which is in Oman, and the principal port of trade in that province; the description of the mountainous coast is characteristic, and the distance, supposing Ras-el-had to be Syagros, not incongruous. The order, however, in which Moskha occurs in the *Periplus*, is perfectly inconsistent with the situation of Maskat. There does not appear to be any other trace of a district named Omana in the vicinity of Fartaque. The difficulty which arises from the mention of these two names, Dr. Vincent confesses himself unable satisfactorily to solve, while fresh and incontrovertible proofs arise with the progress of the voyage, that Syagros and Fartaque denote the same object. The Moskha of the *Periplus* is therefore conjectured to be Seger.

At the distance of fifteen hundred stadia, says the writer of the *Periplus*, are seven islands almost in a line, called the islands of Zenobius, at the termination of the district called Asikho. Four islands, corresponding in distance with these, are described by Al Edrissi; and represented in modern charts, in the bay of Curia Muria, Hasek being still the name of the principal town on the bay. The computation of seven, it is conjectured, may have arisen from some rocky or deserted islets attached to them.

At the distance of two thousand stadia from the islands of Zenobius, occurs an island of considerable magnitude, called Sarapis, identified with Mazeira. D'Anville, in acknowledging this coincidence, exposes his inconsistency in fixing Syagros at Ras-el-had.

Leaving the promontory of Ras-el-had, the islands of Kalaius are next mentioned, corresponding with those of Suadi, near the entrance of the Persian gulph. At the mouth of that gulph are the islands of Papias and the fair mountain.

Within this gulph the ancient geographer mentions only two particulars; the existence of a pearl-fishery, and a town called Apologas, which our author agrees with D'Anville in fixing at Oboleh. This book concludes with a clear and judicious, though brief account of the revolution of oriental commerce, for which we must refer to the work itself.

The Indian geography of the *Periplus* is the subject of the fourth book, introduced by some general remarks on the commerce of that celebrated country. The following reflections, applicable to

he state of our own dominion there, we transcribe with pleasure.

"It is a political consideration, awful to contemplate, and difficult to discuss, but still necessary to keep constantly in view, when we reflect how deeply all the interests of our country are concerned in the continuance of the pre-eminence we at present enjoy. Our possessions in India are almost become a part of our existence as a nation: to abandon them is impossible; to maintain them—a perpetual struggle with the native powers, and the powers of Europe to support them. It requires all the vigilance of government, and all the vigour of the controuling power, to take care that the natives should not be discontented under our empire; and that the nations of Europe should not be outraged by our approach to monopoly. These considerations, however, are totally distinct from the commerce itself, and totally foreign to the object of the present work: I touch them only as they arise, and return with pleasure to the humbler office of a commentator on the Periplus."

The narrative of the voyager is less distinct and accurate from the entrance of the Persian gulph to the mouth of the Indus, than in the rest of the route which he describes; in consequence of which

Dr. Vincent supposes that he did not personally visit this part of the coast, but proceeded at once from Arabia, either to the Indus, or Barugaza. Omana he places in Persis, which other geographers assign to Carmania or Gedrosia, and which must of necessity belong to one or other of these two provinces, according to the limit which is supposed to divide them.

Omana is followed by the bay of the Terabdi, answering to the Paragon of Ptolemy. There however appears to be no bay upon the coast. Adjoining to this supposed bay is a port named Oraia, standing by a small river, the situation of which it is difficult to decide.

Nothing remarkable occurs on the remainder of this coast before our arrival at Scindi, called Scythia by the writer of the Periplus, and Indo-scythia by Ptolemy. The marts on the Indus in the age of the Periplus, were two; one near its issue called Barbarikè, the other within the country named Minnagara. The latter was the capital of the country. Barbarikè is said to be situated on the middle channel of the Indus. The following is the list of its imports and exports:

"The articles imported at Barbarikè are,

Ἰματισμὸς ἀπλὸς ἱκανός,	-	-	-	Clothing, plain, and in considerable quantity.
Ἰματισμὸς νόθος ἢ πολὺς,	-	-	-	Clothing, mixed.
Πολύμητα,	-	-	-	Cloth, larger in the warp than the woof.
Χρυσόλιθον,	-	-	-	Topazes.
Κοράλλιον,	-	-	-	Coral.
Στάραξ,	-	-	-	Storax.
Λίκανος,	-	-	-	Frankincense.
Ἰατὰ σκεύη,	-	-	-	Glass vessels.
Ἀργυρέματα,	-	-	-	Plate.
Σίγμα,	-	-	-	Specie.
Ὀίνος ἢ πολὺς,	-	-	-	Wine.

"The Exports are,

Κόστος,	-	-	-	Costus. A spice.
Βδέλλα,	-	-	-	Bdellium. A gum.
Λίκαιον,	-	-	-	Yellow dye.
Νάρδος,	-	-	-	Spikenard.
Λίθος καλλαινός,	-	-	-	Emeralds, or green stones.
Σάπφειρος,	-	-	-	Sapphires.
Σινικά δέρματα,	-	-	-	Hides from China.
Ότίονον,	-	-	-	Cottons.
Νήμα Σινικόν,	-	-	-	Silk Thread.
Ἰνδιαν μέλαν,	-	-	-	Indigo, or Indian ink?"

The first remarkable object on leaving the Indus, is the bay of Cutch, called Canthi by Ptolemy, and Eirinon in the Periplus. The description of the voyager appears to be on the whole accurate. The

next bay is that of Barugaza on the east of the Guzerat, of which a very clear account is given. The tide at Barugaza flows with remarkable violence and suddenness.

"The circumstance of the tides is not peculiar to this place, though they are more violent here than elsewhere; for almost all the rivers of India are large, and have both the flux and reflux of extraordinary strength, conforming with the moon, new and full, as well as for three days after each, and falling off again in the intermediate space; but at Barugaza this violence is more remarkable, so that without warning you see the bottom laid bare, and the sides next the coast, where vessels were sailing but just before, left dry as it were in an instant; again, upon the access of the flood-tide, the whole body of the sea is driven in with such violence, that the stream is impelled upwards for a great number of miles, with a force that is irresistible. This makes the navigation very unsafe for those that are unacquainted with the gulph, or enter it for the first time. No anchors are a security; for when the vehemence of the tide commences, there is no intermission, no retreat: large vessels caught in it are hurried away by the impetuosity of the current, and thrown on their sides, or wrecked upon the shoals; while the smaller ones are completely overset. Many also that have taken refuge in the creeks, unless they have fortunately changed their place in due time, (which it is very difficult to do, on account of the instantaneous fall of the water,) upon the return of the tide are filled with the very first head of the flood, and sunk. But all these circumstances united concur more especially, if the new moon falls in conjunction with the night tide; for then, if you have been prepared to enter upon the first of the flood, and when the sea appeared perfectly calm, you shall hear, in a moment, a rushing sound like the tumult of battle, and the water driving forward with the utmost impetuosity, covers the whole of the bare shoals in an instant.

"It will immediately appear, that this description relates to that sort of tide which is called the Bore, and is common to many places in Europe as well as India. On the coast of Egypt, or in the Red Sea, the author could have seen nothing that resembled it, and he dwells upon it, therefore, with more minuteness than a modern observer would employ; but from this very cause it is that we have a picture which cannot deceive us, and a conviction that the author relates what he had himself experienced."

Of that part of the *Periplus* which relates to Barugaza, and the objects of the surrounding country with which it is connected, Dr. Vincent observes that there is reason, after tracing these several connections, to allow that there is no specimen of ancient geography so completely satisfactory, or so consonant to truth, as the portion now under contemplation. The principal relative situations are those of Ozene, Pithana, and Tagara, concluded by lieutenant Wilford, and our

author, to be Ougein, Pultanah, and Desghir. The latter place, adjoining to Elore, and near the modern Aurungabad, is still distinguished by surprizing ruins, spreading over a surface of two leagues in extent. Barugaza is without doubt Baroach, now possessed by the English.

From Barugaza the *Periplus* proceeds southward along the western shore of the peninsula of Hindostan. The division of this tract of country into six provinces, both in ancient and modern times, is remarkable. The modern names are Cambay or Guzerat, Concam, Dekhan, Canam, Malabar, and Travancore: the ancient appellations in the *Periplus*, are Barugaza, Ariakè, Limurikè, the kingdom of Pandion, Paralia, and the Pearl-fishery.

The province of Ariakè, though represented by the author of the *Periplus* as extending seven thousand stadia to the south of Barugaza, is supposed by modern geographers to have been nearly coterminous with the present district of Concam. The first places mentioned are Akabaroos, Oopara, and Kalliena. In regard to Kalliena, all suffrages are united to fix it in the neighbourhood of Bombay; for Bombay is upon an island, close to which, on the main, was an ancient city called Gallian, the ruins of which still remain. Oopara is thought to be the Soopara of Ptolemy, which was long a city of note, and supposed to have been situated in the neighbourhood of Surat. The situation of Akabaroos is undetermined.

On the succeeding part of the coast, our author finds reason, apparently with justice, to differ from D'Anville; who seems to confound the provinces, and the order of the positions given by the *Periplus*, for the sake of finding modern names, somewhat similar in sound to the ancient.

The termination of the Ariakè, the Concam or Pirate-coast of the moderns, Dr. Vincent considers as defined by the *Sesekreienai* of the *Periplus*, which are probably the Burnt islands off Vingora, not distinctly described till of late. The island of the Aegidii is commonly supposed to be represented by the Angedives. Our author, with greater probability, assigns it to Goa, as more conformable with the description, and more consistent with the divisions of the coast. He supposes Leukè, or the white island, to denote the chief of the Angedives.

In the province of Limurikè, which, though supposed by D'Anville to be Canam, is demonstrated to be the modern

Canara, only three places are mentioned, Naora, Tundis, and Mooziris. The only data for the position of these places afforded by the Periplus, arise from that of Nelkunda, though in a different province.

"For the position of Nelkunda, I am obliged to major Rennell, who is the first geographer, as far as I have learnt, who has fixed it at Nelisuram. That he is correct in this, I am persuaded, admits not of presumptive proof only, but demonstration:

"For we may first observe, that Nelisuram is not only a mart itself, but gives name to a district. This district is not in Canara, but Malabar: the frontier of Malabar, the boundary wall which runs from the sea to the foot of the Ghauts, is at Dekly, or Dekully, immediately north of Nelisuram. This wall is still visible; and this in a peculiar manner makes it correspond with Nelkunda, which was the first port in the kingdom of Pandion.

"2. A second proof may be derived from the name itself, which Orme writes Neileaseram. Nella, according to Paolino, signifies *river*, and Ceram a *country*; and if Nella-ceram be the country of Nella, Nelkunda must be the fort of Nella, resembling Goleconda, Inna-conda, or Conda-poor, on this identical coast of Canara.

"3. But the last and best testimony is that of major Rennell himself, who mentions 'a large river, named Cangerecora, whose course is from the N. E. and which falls in about four miles to the north of mount Dilla; previous to which its course is parallel to the sea-coast for about eleven miles, being separated only by a spit of land. The forts of Nelisuram, Hamdilly, and Matteloy, are situated on this river, which is joined by several others that descend from the Ghaut mountains, which in this part approach within twenty-two miles of the coast. I cannot help considering this Nelisuram, which is situated twelve miles up the river, as the place meant by Nelcynda or Melcynda, by Pliny, and Ptolemy—a place visited by the Egyptian and Roman ships.'

"Let us then observe, that the Nelkunda of the Periplus lies actually the same twelve miles up the river; and after this ask, whether all these circumstances can be accidental: for if the correspondence is evident, it is but reasonable to assume this proof as a demonstration."

Naora is the first port of Limuriké, and Mooziris the last. The Periplus places Mooziris fifty miles to the north of Nelkunda, Tundis fifty miles north of Mooziris, and a third fifty north are assumed to Naora. These positions agree with Mangaloor, Barceloor, and Onoor. These stations are certainly assigned with much greater probability than those adopted by former geographers.

The kingdom of Pandion agrees with

Malabar. Its principal port was Nelkunda, the situation of which was before discussed. Its trade appears to have been nearly of the same nature with that of Calicut, the present mart of the province. The regular course of the commerce with the western world is supposed to have ended here.

An interesting disquisition occurs on this occasion respecting the discovery of the monsoon by Hippalus, and its influence on the commerce of the ancients, to which we refer the curious reader.

The name of the southern promontory has descended to us almost unchanged, being known to the ancients under the name of Comar. The following is the description of it by Paolino.

"Nothing can be more enchanting to the eye, or delicious to the senses, than is experienced in a voyage near the extremity of the peninsula. At three or four leagues from the coast, the country of Malabar appears like a theatre of verdure: here a grove of cocoa-trees, and there a beautiful river pouring its tribute into the ocean, through a valley irrigated and fertilized by its waters. In one place a group of fishing-vessel; in another a white church, peering through the verdure of the groves; while the gentle land-breeze of the morning wafts the fragrance exhaled from the pepper, cardamum, betel, and other aromatics, to a great distance from the shore, and perfumes the vessel on her voyage with their odours; towards noon succeeds the sea-breeze, of which we took advantage to speed the beautiful Calypso towards the port of her destination."

Kolkhi and the Pearl-fishery are connected by Ptolemy and the Periplus, and placed to the eastward of Cape Comorin. The account given by the ancient geographer of the situation of Ceylon is very inaccurate. Dr. Vincent however makes us amends, by collecting with great diligence and accuracy all the information which the ancients have left us respecting this celebrated island. They in general strangely miscalculated its situation and magnitude. The writer of the Periplus supposes it to stretch across the Indian sea, nearly to the coast of Africa. Ptolemy represents its circumference as two thousand four hundred and fifty miles; and carries its extreme southern point more than two degrees south of the equator. Yet the accuracy of his information with respect to some particular objects, according to the following account, is remarkable.

"And yet, in the midst of this darkness,

Ptolemy's information was such as, in one instance, to confirm the rank which he so deservedly holds in preference to others; for he gives the names of places more correctly, and more conformably to modern intelligence, than appear in any other author, Greek, Latin, or Arabian. This is a merit peculiar to him, not only here, but in the remotest and least known regions of the world: it proves that his inquiries were made at Alexandria of merchants or mariners, who had actually visited the countries he describes; but that they had not the means of giving true positions, because they had neither instruments for observation, or the compass to mark their course. The north polar star was not visible; and if they sailed by the Canopus in the southern hemisphere, as Ptolemy asserts they did, that star is not within fifteen degrees of the pole, and would give occasion to a variety of mistakes. Still, under all these disadvantages, it is something to have procured names that we can recognize; and these names at once put an end to the dispute formerly agitated among the learned, whether the *Taprobana* of the ancients were Ceylon or Sumatra. They prove likewise, that some merchants, or travellers, had reached the capital and interior of the island. By them the capital was found where Candy now is, and called *Maagrammum*, the *great city*, or metropolis, which was placed on the river Ganges, still called the *Ganga*, *Gonga*, or *Ma-vali-gonga*, the *great river of Babi*, which flows to Trincomalee. The Hamallé mountains, among which is the Pike of Adam, are likewise laid down relatively in their proper position, and called *Malé*, the Sanscreeet term for mountains; and above all, *Anurod-grammum* is preserved in *Anurod-borro*, or *Anurod-gurro*, a ruin found by Knox, while he was escaping to the coast; which, he says, lies ninety miles north-west from Candy, and in a position correspondent with the account of Ptolemy. He found here three stone bridges; the remains of a pagoda or temple, such as no modern Ceylonese could build; and many pillars, with stone-wharfs on the river *Malwatuwa*. *Sindocardia* is another name, expressing the mountains of the *Hingoes*, the name by which the natives call themselves; and *Hingo-dagul* is their name for Candy; for Candy is a hill or fortress on a mountain; and *Hingo-dagul*, the city of the *Hingoes*, perverted by corruption into *Chingoo-les*, by which name they are at present known to the Europeans settled on the coast."

The information of *Cosmas Indicopleustes*, who did not however visit the island, is considerably more correct than that of his predecessors.

The remainder of the narrative of the *Periplus*, as appearing to have been collected by the author from report, is given in a translation, accompanied by notes.

Three dissertations connected with

the subject of the *Periplus* follow the work.

The first is on the *Sinæ*, the *Seres*, and the termination of ancient geography on the east; in which the author attempts to prove, and in our opinion with great probability, that the *Thinae* of the *Periplus*, the *Sinæ* of most writers, the *Tzinistæ* of *Cosmas*, the *Seres* or producers of silk, all describe the same object, that is, China and its inhabitants, or rather the northern part of that great empire. The deductions of the author may be best expressed, within a short compass, by his own words.

"In the course of this investigation, then, we have learnt from ancient authorities, that the *Sères* are the *Thinae* of *Eratósthènes*—the *Sinæ* of the *Periplus*; that their country lies between Tartary, on the north, and India extra *Gangem*, on the south; that it is the remotest region towards the east; that it is bounded on its eastern front by the ocean; that the ocean extends (in their opinion), without interruption, on the same parallel to the coast of Spain; and that silk was brought from this country, where it was originally found, to India, and out of India, by the Red Sea, into Egypt, and from thence to Europe."

The traffic with the *Seres* over land is rendered indisputably certain, and traced with as much precision as can be expected.

"*Cosmas*, as far as I can discover, is the first author that fully asserts the intercourse by sea between India and China; for he mentions that the *Tzinistæ* brought to Ceylon silk, aloes, cloves, and sandal-wood. The articles themselves are the specific exports of China still; and that the *Tzinistæ* are Chinese, cannot be questioned; for he expressly mentions their country, not merely as exporting, but producing silk; and specifies the distance from it by land as much shorter, compared with the voyage by sea. This circumstance can accord with no other country, at the extremity of the east, but China; for no other country is so situated as to have this double communication, consequently his *Tzinistæ* are Chinese: they have the same attributes as the *Sères*—they are the same people; first, by the means of approach; and, secondly, because they are surrounded by the ocean on the east, and because that beyond them there is no navigation or habitation. This is the one point, above all others, which I have laboured to establish by this disquisition; and though I obtain not my proof till the sixth century, the evidence is consistent in all its parts, and complete. The inference is justifiable, that the same intercourse existed by sea, as well as by land, in ages much earlier, though the account had not reached Europe, and though the proof is defective. It is in

vain that I have searched for any intelligence of this sort previous to Ptolemy, though I was very desirous to find it, and prepossessed in favour of its existence."

To the evidence collected on this subject, may be added that (referred to by Gibbon, II. 141, 8vo.) of the national historian of Armenia, Moses Chorensensis, who flourished in the fifth century. "In the Armenian history, as well as geography, China is called Zenia or Zenistan. It is characterized by the production of silk, by the opulence of the natives, and by their love of peace, above all the other nations of the earth."

The second dissertation is a commentary on the twenty-seventh chapter of *Ezekiel*, containing a prophecy against Tyre, and furnishing a curious and valuable record of ancient commerce.

The third dissertation is by the earl of Macartney, on the navigation and compass of the Chinese.

The appendix is very learned and valuable, containing a catalogue of the articles of commerce mentioned in the digest of the Roman law, compared with those in the *Periplus* of the Erythrean sea, suggested by a recommendation in the *Indian Disquisitions* of Dr. Robertson. The article on cinnamon we should be tempted to extract, did it not exceed our limits.

This work bears honourable testimony to the learning and talents of its respectable author. The subject which he has treated he seems almost to have exhausted, and he has certainly thrown much light on the obscurities of the ancient oriental geography.

CHAPTER V.

MODERN LANGUAGES.

An Essay on the English Elements, Accents, and Prosody: respectively derived from Principles common to every Language, ancient and modern. 8vo. pp. 205.

THE vocal part of language, the great instrument of that noble faculty, which had long remained in undeserved neglect, has of late years begun to experience that attention which its importance merits. The result has been a clearer arrangement of the elements of speech, the acknowledgment of the barbarous but incorrigible capriciousness of our own and some other modern alphabets, and the establishment of just and natural distinctions between the several accidents of vocal language, which had been strangely confounded by the inattention of grammarians. In no instance has this inattention been more conspicuous, than in the disputes which have been agitated respecting the proper mode of pronouncing the Greek language. The different partisans in this question were divided into the advocates for accent, and those for quantity; strangely forgetting that each of these qualities is incident to every word that is uttered; and that, when properly understood, there is not the least inconsistency between the modes of pronunciation which they require. The advocates for quantity however, as they termed themselves, fell into the greatest absurdities; for the whole amount of the reformation which they proposed, and in a great degree accomplished, is that of transferring to the Greek language the rules of Latin accentuation, while they continued in many instances, equally with their adversaries, to violate the laws of quantity. This subject was so little understood, even by grammarians of the greatest eminence, that even Valckenaer, while his learning did not permit him to doubt the genuineness of the Greek accental marks transmitted to us, yet asserts, that not a single verse of a poet, not a single sentence of an orator, is to be pronounced according to them. In our pre-

sent ignorance of the true pronunciation of antiquity, this rule may perhaps be admitted; as applied to ancient practice it is manifestly erroneous.

The author of the present tract, though we feel ourselves compelled in some respects to differ from him, has, on the whole, treated his subject with acuteness and ingenuity. His book is distributed into three parts: the first treating on elementary sounds; the second, on accents; the third, on prosody; chiefly that of the English language, but illustrated by frequent references to those of antiquity.

The following is the introduction to the first of these divisions.

“ 1. The vocal and articulate sounds, which all human speech is composed, are nature limited to a small number. To analyse a language, therefore, and ascertain the elementary sounds, which, by various combinations, constitute the whole of its vocabulary, would seem to be no very difficult undertaking. It is certain, however, that we have yet no perfect analysis of our own language; of which the investigation is perplexed by our very imperfect and irregular spelling.

“ 2. Vowels, diphthongs, and consonants are names by which sometimes letters are meant, and sometimes the sounds of which those letters are respectively the arbitrary signs. But, surely, things in their nature essentially different ought to have distinct appellations. For the present, I beg leave to use these names constantly in one sense, signify not letters, but sounds only, which are the elements of speech; and the principal reason of our present uncertainty respecting those elements, in our own language, is, that we have endeavoured to ascertain them by tracing the various powers of the letters which we read, instead of comparing and classing the sounds which we hear.

“ 3. The vowels, in English, are represented sometimes by single letters, and often by two or more letters combined; and whether single or combined, the same charac-

ers frequently represent different vowels. but, however represented, every vowel in our language, except one, is subject to the distinction of *long* and *short*, independently of the other accidents of *tone* and *emphasis*. *fun*, for instance, is a short syllable, and *me* a long one; and hence the first has been considered as an example of the short, and the second an example of the long vowel.

So also *men* and *mene*, *moll* and *mole*, exemplify what have been called the short and long vowels *e* and *o*. Let the words, however, be compared, not as written characters, but as audible sounds; and if *men* and *me* be alternately pronounced with attention, they will be found to differ in nothing at the length of the vowel. So also *moll*, being only lengthened in sound, becomes *mo*; and by the same process, the short syllable *ban* is drawn into *baln*; *bin* into *be*, &c.

4. By this simple experiment we shall find, that, however differently represented, by single letters, or otherwise, the vowels (always meaning the vocal sounds) in every word or syllable of the same class, in the following list, are constantly the same, excepting only the difference of *quantity*, which is marked in the same manner.

List of Words classed according to their respective Vowels.

1. Böt, böught; cöll, cäll; döñ, dāwn; not, naught; &c.
 2. Pän, pälm; läp, läugh; rät, räft; Säim, psäim; päpä; &c.
 3. Bän, bāne; däll, dāle; wrän, räin; &c.
 4. Bän, beän; däm, deäm; däll, deäive; räll, reäive; &c.
 5. Nö, knöwn; jöcöse, möröse; &c.
 6. Böök, böön; püll, pööl; lööse, löse; dö, dööm; &c.
 7. Büt, bün, döne, sön, &c. always short.
- Of these vowels, the last has been thought peculiar to the English tongue. It is, in one respect, an imperfect vowel, as it is incapable of being prolonged, or forming a long syllable. It is, however, very nearly the same with the Italian *o chinso*, which is probably the same with the ancient *ομικρον*; nor does it differ sensibly from the sound of *e* in the French monosyllables *je*, *me*, *te*, *se*, *je*, *le*, &c. and in the final syllables of the words *gloire*, *victoire*, &c. &c. when they occur in poetical composition. See, on this subject, a letter from Voltaire, subjoined to the *libre d'Olivet's Prosodie Française*.

The author does not appear to us to be quite accurate in several of the sounds which he here classes under the seventh vowel; the *o* in *venöm*, the *e* in *thun-der*, the *u* in *büt*, all seeming, to our ears at least, to be distinguished by shades of perceptible difference, though too minute perhaps for classification.

The analysis of the diphthong *I* (p. 13),

as composed of the seventh, very rapidly melted into the fourth of the preceding vowel sounds, is not to us satisfactory. It appears rather to result from the combination of the second and fourth, the former element passing rapidly into the latter.

From vowels the author passes to diphthongs and triphthongs; of the former of which he enumerates eighteen, of the latter three, in our language. Under the former of these heads, the question respecting the power of the characters *w* and *y* is largely treated, and their vowel sound is very satisfactorily maintained.

The distinction between the sounds of the word *that*, as emphatic or unemphatic, gives occasion to a grammatical disquisition on the force and propriety of that word when employed as a relative. Its *necessity*, as subservient to any discriminations of sense, we do not perceive; to its use for the purposes of euphony and variety, we are ready to subscribe.

Accent is the subject of the second part of this work; by which term the author understands not emphasis, but intonation, some mode of which accompanies every syllable that we pronounce. The hypothesis which he adopts, is that of Mr. Steele, explained in a work entitled '*Prosodia rationalis*,' not, we believe, generally known, but in many respects deserving of attention.

The use of the Greek accentual marks our anonymous author gives up, as wholly lost, and incapable of being retrieved. The exact power, once lost, cannot certainly be restored. Two circumstances, however, seem strongly to imply that they were intended to denote the emphatic syllables of words; one, their application only to single syllables in each word; and the other, the uniformity of that application to a particular syllable. The slides of Mr. Steele and our author are perpetually varying, with the variation of circumstances and connection in which the words to which they are applied occur.

The remaining subject of this little volume is English prosody. The meaning of the word prosody is simply accent, and in this sense it was originally employed. It has however been gradually deflected by custom from that signification, and is now used to denote the laws by which syllables are arranged in metrical compositions.

The author first shews that the English, like the ancient languages, and in all

probability, like every other language that has ever been spoken, possesses distinctions of quantity in the syllables of which it is constructed. For practical purposes this distinction is denoted with sufficient accuracy by the ratio of two to one, and the ear of every one will enable him to decide that it exists in our own language.

Rhythmus, the Greek writers tell us, has its essence in arsis and thesis, or in plain words, in time-beating. What circumstance then is to determine the pulsations which distinguish it? Not the mere quantity of the syllables, answers our anonymous author, for verses occur in Greek, and may occur in other languages, composed altogether of syllables of equal length, and which therefore contain no indication of the rhythmus to which they are intended to be subject. The division of the words may however afford some indication; and it is at all events to be remembered, that the occurrence of these verses is so rare, that it is scarcely admissible to build any theory of prosody upon them. To such verses may be applied the observation of Herman, 'isti omnes numeri, quum certis formis careant, in singulis poetarum locis adnotandi sunt.' *De metr. Græc.* p. 370.

If the principle of rhythmus is not to be found in quantity, it can only depend, our author argues, on emphatic impulse. 'It is therefore manifest,' he concludes, 'that what has been hitherto commonly considered as a great defect, and a striking mark of inferiority, and even barbarism, in modern languages, has at all times been alike inherent in every language, namely, that in our versification, the rhythmus depends on emphatic impulse.'

To establish more fully the similarity between the ancient and modern systems of metre, he endeavours to show that the distinctions of short and long syllables were far from being so accurate as is commonly imagined. The ancient writers indeed tell us that of short syllables, some were shorter, of long syllables, some longer, than others. But the circumstance from which our author principally argues, is the law by which a short syllable in position is considered as a long one. 'It were absurd,' he says, 'to suppose that any real augmentation was ever effected by the simple collision of mute

consonants.' But this statement does not appear to us to be accurate. Even Dionysius, in his examples of *ὀδός*, *πόσις*, *τοός*, and *σποσός*, allows that some additional time accrues in consequence of the accumulation of consonants, though not sufficient to change the denomination of the syllable. But if this change results from consonants preceding a short vowel, will certainly result in a greater degree from their arrangement after that vowel, in consequence of the greater effort which, in that situation, they must be made to utter. Every one must be sensible that the syllable *ex* is properly long, the elision of the consonant requiring at least an equal tone with that of the vowel. The first four letters of the word *ἐξ* are the same with those of the word *οὐβρυς*, yet who does not perceive a greater length of time, which, from the difference of their arrangement, is requisite in the latter case for their utterance. This subject is well illustrated by Mitford, in his 'inquiry into the principles of harmony in language.' p. 41.

The great difference which subsists between the ancient and modern metrical systems, appears to us perfectly obvious. In the ancient languages, not only are long and short syllables distinguished with sufficient accuracy from each other, but the laws by which they are arranged, and the several species of verse are clearly ascertained, and the licences which in certain cases are admitted, are confined within determinate bounds, while the variation of the accent (or emphatic syllable) remains in most instances, nearly a matter of indifference. On the other hand, in modern versification, the long and short syllables may be easily distinguished from each other, yet no rule can be devised for their regular recurrence; while the emphatic syllables possess their determinate place in every verse, with the admission of a few known liberties. In other words, the modern metrical ictus is coincident with the emphatic syllables, and determines their position; in the ancient languages, the rhythmical ictus is commonly independent of the syllabic emphasis; and the only uniformity observable in the versification of those languages, is in the employment and arrangement of syllables according to their quantity.

CHAPTER VI.

BRITISH TOPOGRAPHY AND ANTIQUITIES.

OUR antiquarian and topographical list is of the usual length and of the average value. Much labour and time, as appears to us, is, if not absolutely lost, at least very ill employed, in what are called topographical researches. The only modern folios are county histories, which are executed for the most part with such tedious minuteness as to render them to the last degree wearisome and unprofitable; and the writers of them, in their eager ambition after the praise of *research*, have, in too many instances, entirely lost sight of a quality to the full as necessary and meritorious; we mean judgment in selection. At the hazard therefore of incurring the charge of herodoxy, we shall take the liberty of stating what appear to us to be the prominent errors that characterize the topographical histories of the present day. It may be said in general that the grand feature of all these works is prolixity, and that a rigorous compression may be introduced into every department with much advantage; depending to particulars, we should in the first place wish the ages of barbarism, and the few relics that they have left behind, to be dispatched in a very summary manner: circles of stones, barrows, places of encampment, whether British, Roman, Saxon, or Danish, have already received much more than their legitimate share of investigation, and may be abandoned without reluctance to oblivion and the ploughshare. Nor does it seem absolutely necessary to describe every old castle with the minuteness of a surveyor, or to relate in full detail every plundering expedition which it sent forth or resisted. England being the country in which that species of architecture, vulgarly called Gothic, has been brought to its highest perfection, and there being now no probability of its again recovering from the disuse into which it has fallen, no liberal critic will blame the topographer if he lingers with fond reluctance within the consecrated walls of our cathedrals, and describes at length those venerable structures, which, whether we consider the sublimity of their general effect, or the richness and fantastic variety of their minute decorations, may proudly and successfully enter into competition with the chaster but less impressive efforts of Greek and Roman genius. A similar indulgence will be conceded to the topographer while describing the remains of our monastic edifices: as architectural fragments, and as picturesque objects, many of them are entitled to high praise; but surely there is no necessity to dwell long on their former inhabitants; to investigate with scrupulous attention the local peculiarities of their government; to write critical dissertations on the succession of their abbots and priors; and to rescue from merited neglect their splendid impositions, their gaudy mummeries, by which the reign of ignorance, of slavery, and superstition, was so long upheld. For a *protestant* ecclesiastic to dilate with complacency on these topics, argues something more than bad taste.

The general reader would no doubt be pleased and benefited if the greater part of the genealogies, and what comes under the denomination of family and manorial history, was greatly compressed; but as the principal patronage of county histories, and the chief part of the readers, are to be expected from among the residents in the district described, a deviation from the usual practice in these particulars would we are afraid materially affect the encouragement which is required in so arduous an undertaking. A more restricted use of the church-registers, and a more select assortment of monumental inscriptions, might however be introduced without any disadvantage, and greatly to the benefit of the literary character of the work: the possession of parish-priests, clerks, and church-wardens; carpenters', glaziers', and plumbers' bills, and circumstances of similar importance; are in their proper place among the manuscript archives of each parish; but when occupying page after page of a county history, constitute mere waste paper.

But if our topographers are liable to the charge of prolixity on the above-mentioned topics, there are others, and those of no small importance, of which the reader may justly complain for their mortifying conciseness. Such is the case in general with all the branches of natural history. Sometimes a bare catalogue of plants, birds, and fishes, is thrust into some bye-corner of the book, accompanied by a few mineralogical details collected a century ago; but of real science and personal observation there is for the most part a total deficiency. The various and important topics comprehended under the general term statistics, are also treated of very unsatisfactorily; and in short every thing relating to the present state of the country; the information requisite for this purpose being not to be had by consulting written documents, but by laborious personal enquiry. Lastly, a greater accuracy both of plates and maps might be obtained at no great additional trouble, and with a very manifest gain both of beauty and usefulness.

ART. I.—*The History of the Orkney Islands: in which is comprehended an Account of their present as well as their ancient State; together with the Advantages they possess for several Branches of Industry, and the Means by which they may be improved. Illustrated with an accurate and extensive Map of the whole Islands, and with Plates of some of the most interesting Objects they contain. By the Rev. GEORGE BARRY, D. D. Minister of Shapinshay. 4to. pp. 509.*

THE present volume furnishes much important information concerning a portion of the British dominions which has hitherto been but little known. We shall therefore indulge ourselves, and at the same time, we presume, gratify our readers, by a copious account of the work, and of the islands it professes to describe.

Situated on the north of Scotland, surrounded by a tempestuous sea, and intersected by dangerous friths, the public attention has been seldom directed to this part of the British isles. While her legitimate sister, the Hebrides, can boast of a Johnson, a Pennant, and a Banks, as philosophic visitors; Orkney has been indebted chiefly to residents for any published descriptions of her scenery, produc-

tions, or commercial consequence: so that if we except Torfæus, who has given a history, and Wallace, who, about a century past, furnished a description, every thing that relates to these isles must be sought for in writers who have professedly written upon other subjects: and for this purpose their detached accounts must be collected and arranged. This Dr. Barry professes to have done; 'his intention being,' according to his own statement, 'to look back to early times, and, by means of those feeble and scattered rays of light, furnished occasionally by ancient writers, to point out who were their first inhabitants;' and 'having thus taken an extensive view from that period, and from facts traced the various changes they have undergone, and the effects of such changes,

o the time when they were granted undecemable to a subject who sold them, and they finally became a part of the town of Scotland,' Dr. Barry then adverts to their present state. This part of his plan he considers of the greatest importance, and as such he states, 'that he has taken more than ordinary pains to give the fairest statements, and place every part in the clearest and most interesting point of view.' But to the end that these objects may be accomplished, he proposes to give a particular description of the islands which compose the group. The history thus considered, he observes, naturally divides itself into three books.—1st, Contains a general view of the islands, with a geographical description of each, &c.—2d, An account of the early inhabitants; transactions and character of the people who conquered them; monuments of antiquity; and subsequent history.—3d, Includes a statistical account of their favourable situation, and the advantages to be derived from them. Such is the plan of the work as laid down by the author. How far he has succeeded in its accomplishment, we shall endeavour to show: by giving a faithful analysis, pointing out its excellences and defects; and, while we notice valuable statements, endeavour to detect errors, and correct inaccuracies.

We have thought it necessary to state thus much of Dr. Barry's plan; but in justice to ourselves and our readers, we must observe, that there appears a want of the "lucidus ordo," so necessary to produce perspicuity and prevent tautology. Thus, in the *particular description* of each island, the Dr. anticipates what he again repeats in his *general views*. Frequent repetitions of vegetables, minerals, birds, and fishes, occur throughout. The stones of Steunis, and the dwarfic stone, might have been left to the chapter on *monuments of antiquity*; and the account of the ancient language might have been referred to the description of the original inhabitants. Chap. VI. of Book II. surely ought to have followed immediately after the fourth chapter, or have been incorporated. Some additions also might have been made to the historic part, of a highly interesting nature; which would have rendered the present body of information still more valuable, without much increasing the size of the work.

The Orkney islands, justly denominated the archipelago of the northern sea, lie north of Duncansby Head, the Cape

Orcas of the ancients, between 58 deg. 45 min. and 59 deg. 23 min. north latitude, and 2 deg. 10 min. east, and 2 deg. 47 min. west, from the meridian of Greenwich, according to the map here copied from that of Mr. Mackenzie; who, in his survey, places his first meridian through the town of Kirkwall, in the island of Mainland. Other maps, considered accurate, state the latitude and longitude a little different.

As to their number, writers have differed, from the earliest accounts to the present time. By the ancient writers they were reckoned from thirty to forty: Pomponius Mela, the most to be depended upon among them, enumerates thirty: and it is probable both he and others took their accounts from the principal of them in point of size, whether inhabited or not. Gyraldus mentions them under the title of *Orchades* and *Leuchades*; but he does not say he ever visited them. He quotes, for authority, Orosius and Isidorus; who observe there were thirteen inhabited, and twenty desert; which account, at the time they wrote, was probably correct. Dr. Barry derives his information, not from his own observations, but from a survey made about half a century ago, at the instance of the Board of Admiralty, by Mr. Murdo Mackenzie; the accuracy of which has been confirmed by subsequent observations. In addition to these, however, any remarks of Dr. Barry's from personal knowledge would have been a desirable acquisition. According to this survey, the number is fifty-seven; twenty-nine only of which are inhabited, and the remaining twenty-eight, denominated holmes, are used for depasturing cattle. Besides which, there are numerous rocks, not devoid of herbage, called skerries.

The *etymon* of the name has no less perplexed the minds of antiquaries: the question is, whether the cape took its name from the islands, or the islands from the cape? In the former case the name is of Gothic origin; but in the latter of British. Those who side with the first, derive it from the Gothic *Ork* strength, the cape braving the violence of the waves; and thence deduce, by the addition of another Gothic word *Ey*, signifying an island, *Orcadeys*, i. e. the islands of *Ork*, or *Orkney*. Those who oppose this observe, that the Romans, at a very early period, noticed this cape, under the name *Orcadium*, and the opposite cape of Dunnet-head by that of Tarvedium; and assert their etymology to be really British:—thus *Orcad*,

without the Roman ending, comes from *Or*, a boundary or limit, and *Cadw* to preserve, i. e. the defensive boundary: while *Turvedum*, rejecting the *um*, is equally derived from *Teffyn*, a limit, and—to below; from the noise the sea makes round this headland, i. e. *Clanorona Cape*. Should these be thought unsatisfactory, they are at least as probable as the Scandinavian side of the question.

Dr. Barry commences the subject with some general remarks on the geological appearances of the islands, which tend to show the general direction of elevated and depressed lands in this kingdom, and that the line of depression is uniformly towards the north-east.

The climate, according to our author, is much better than has been represented, or than might be expected from the geographical situation of the islands. But no regular and accurate register having been kept of the weather, no just comparison can be made. It may here be observed, that we are very generally, if not always, partial to our own country respecting weather; and though a royal author (Charles II.), who had travelled the continent, could assert, and perhaps with truth, "that there were more days in which a person could go out with comfort in Great Britain, during the course of a year, than in any country in Europe;" yet no one who has travelled would thence conclude that the climate or weather of Great Britain was superior to that of France or Italy.

The south-west winds are observed to be more prevalent than any other; and the weather, though rarely boisterous, is seldom calm: yet if we can judge from the statement of the quantity of rain, said on the average to fall annually (twenty-six inches), wet weather must be much less frequent than in some parts of our islands. The coldest weather is in the advanced part of our spring; and the month of June is represented as generally the coldest of any. This, Dr. Barry supposes, arises from the dissolving of the immense bodies of ice at this time in the northern ocean.

It is a very curious fact, that though these islands are situate so far north, yet the climate is peculiarly mild; and when compared with a similar latitude on the eastern or western continent, extraordinarily so. The weather is neither severe nor unpleasant. The longest day, according to Wallace, is about eighteen hours, and the shortest about six. It has been said, that from the hill of Hoy, the high-

est land of the whole, the body of the sun may be seen at *midnight*: which probably gave rise to the accounts we find in Solinus and others, that there was no night. It is however true, that in clear weather, for nearly two months, during summer, the twilight is sufficiently strong for ordinary sight to see to read through the whole night. The heat in summer, owing to the obliqueness of the sun's rays, and other causes, is not so great as with us; and from the sea breezes, the cold in winter is seldom so intense. "The extent of heat and cold," the Dr. observes, "is on the average from 25 deg. to 75 deg. of Fahrenheit's thermometer. The spring is severe, the summer moderate, and the autumn mild: the range of the barometer is about *three inches*. A striking peculiarity is, that thunder and lightning, which in most other countries occur generally during the heat of summer or the sultry nights of autumn, are here most frequent in the winter months: and then attended with wind and rain, hail or snow. Though thus situated, they frequently enjoy an unclouded sky; and the mist and vapours, so often imagined to exist by foreigners or strangers, are but of short duration: for the land may be often described, even in the night, at *ten leagues distance*."

But this is frequently owing to the *aurora borealis*, which is here seen to the greatest advantage; and though not confined to these high northern latitudes, the southern equally enjoy them, yet are, under Providence, an inestimable blessing. The author gives a pleasing account of them as they appear on the coast of Orkney.

"This is the *aurora borealis*, now very improperly denominated the northern lights, since, by late discoveries, they have been found to belong equally to both hemispheres. Here they happily appear, both more frequently and with greater splendour, than in most other regions; for during the harvest, winter, and spring months, they arise almost every unclouded night, and often shine with the most magnificent brilliancy.

"The light of the moon at her quadratures, sometimes, on such occasions, scarcely equals them, in illuminating the friths and the islands. Between the setting of the sun and the close of the twilight, they commonly make their first appearance in the north, issuing for the most part from behind the clouds, like a fountain of pale light, the form of which is undefined, and continue in this state a little above the horizon, sometimes only for a short period, and at other times for the space of several hours, without any inter-

tion that can be discovered. They form themselves one while into an arch, the height of which is about thirty degrees, and its breadth about sixty; and the pillars on which it is supported several times broader than the rainbow; and so long as they retain this shape, they are without any sensible motion. At another time they extend farther over the heavens, rise much higher, assume a greater variety of shapes, and discover a dusky hue, with a motion that is slow, but perceptible. Very often they exhibit an appearance quite different, and spread themselves over the whole heavens, diffusing every where a surprising degree of light, and exhibiting the most beautiful phenomenon.

"Their motion, in this case, is in various directions, extremely swift, and, as it were, in separate columns, resembling somewhat the evolutions of a great army. Their lowest extremities are distinctly defined, and deeply tinged with the colours of the rainbow; but their upper ones are tapering and fainter. In several places at once they kindle into a blaze, dart along in almost all directions, for some seconds at a time, and then, as if by the strength of their exertions they had spent their force, they are extinguished in a moment, leaving a brown track in the sky behind them. Near the place where they disappeared, in a short time they flash out anew, and with equal rapidity trace the same path in similar motions, and again expire in the same manner. This they often continue for several hours together, to the great satisfaction and amusement of the spectators on land, and advantage of the mariner, when they gradually die away, and leave through the whole heavens a colour resembling that of brass. If the night be uncommonly still, and their motion very rapid, a whizzing noise has been thought to have been distinctly heard from them at various intervals. This beautiful commutation, which has never yet been satisfactorily explained, is said to have appeared much seldomly eighty or ninety years ago than it does at present. It appears now, however, very often, and seems to occupy that space in the heavens which is between the region of the clouds and the summit of the atmosphere, as the clouds in motion never fail to eclipse it; and as it cannot be seen from two places greatly distant from one another at once, nor yet in conjunction with the same fixed stars, it evidently has no great degree of elevation."

The names of the present inhabited islands are given in a note, as enumerated by Torfæus and Buchanan, the principal of which is Pomona, or *Mainland*. Its greatest length from east to west is thirty miles; and of various breadth, owing to its maritime indentations, from two to twelve: though both Wallace and Mackenzie give a considerably less admeasure-
ment.

The following pleasing description of the surface, may serve as a specimen of the author's descriptive style:

"A ridge of hills, of no great height, rises towards its eastern extremity, which stretches westward along the north side of the parish of Holm, suffers an interruption at the bay of Scalpa, is continued again through a considerable part of the parish of Orphir (where the direction is suddenly changed toward the north at nearly a right angle), and extends through the parishes of Frith and Rendal, six miles distant from, and in a line nearly parallel to, the western boundaries of the island. Through this whole extensive tract the hills are generally green on the sides, many parts of which are very productive when cultivated; and the tops are covered with such an excellent mixture of various kinds of grass and heath, as affords almost constantly a secure haunt for multitudes of moor-fowl, as well as pasture for sheep, and black cattle, and horses. Its breadth is by no means so considerable; for though it reaches nearly sixteen miles on the west side, the east does not extend to above five or six; and near the middle it is so narrow as to form a neck of land, which comprehends little more than a mile in length, dividing the island into two peninsulas. The spacious and beautiful bay of Scalpa bounds the one side of this isthmus, and the bay of Kirkwall the other; and the ground that lies between them is at once so flat, so damp, and, in other respects, of such a nature, as to render it probable that the sea some time or other has occupied the whole space between them. The ancient town of Kirkwall stands on the north side of this tract of land, towards the south-east side of the bay of the same name; and by a little rivulet which runs through the middle of the town (over which a stone bridge of one arch has been built, for the convenience of the inhabitants) is divided into the old town, that bends along the bay, and the new that stretches a considerable way to the southward."

The town of Kirkwall bears strong marks of high antiquity, and many ancient buildings, now in ruins, remind us of its former greatness. Of these islands the Dr. gives us a further pleasing description; and if we could realize descriptions, we should almost be inclined to think, that this, and the circumjacent isles, were the *Fortunate* ones described by the *Roman poets*, in the vicinity of which, both the *Elysium* and *Tartarus* of the ancients were supposed to exist. A circumstance Dr. Barry however records, in his account of the village of Stromness, which, while it evinces a spirit still existing, arduous for emancipation from the rod of oppression, demonstrates the impolicy of all undue restraints on the energy or property of man; and

the wisdom of abolishing all *exclusive rights* in a free country, and for ever crushing the petty tyranny of corporate bodies.

“By means of several acts of parliament, enacted when the principles of commerce were but little attended to, and as little understood, the royal burghs had assumed the right of taxing the hamlets and villages that were in their neighbourhood in an arbitrary proportion of the burdens which they themselves were bound in law to sustain. Stromness suffered, or at least thought so, from the exercise of this right claimed by the neighbouring burgh, and therefore long murmured under a burden which was represented as disproportioned to her trade and her ability; and at length, after repeated remonstrances, refused to bear it any longer. The method of compulsion was instantly adopted, by a reference of the point in question to the Supreme Court, who pronounced this judgment: ‘That there was no sufficient right in the borough of Kirkwall to assess the village of Stromness; but that the said village should be quit thereof, and free therefrom, in all time coming.’ This sentence, which has every appearance of being founded in justice, no less than in law, was, in the spirit of litigation, appealed from, but happily confirmed in the house of lords. Thus a paltry village in the remote regions of the north, was at that period enlightened enough to know its own rights, and had spirit sufficient to reclaim them; while others of great consequence tamely submitted to the yoke, till emancipated by this memorable decision, they reaped the fruit of her spirited exertions. From that time Stromness became a place of more note, in consequence of the freedom she had obtained; and her trade, as trade always should be, neither curbed by absurd regulations, nor shackled by the corporation spirit, will probably soon enable her in her turn to acquire an ascendant over, and prescribe laws to, her former lordly superior.”

In speaking of the island of *Swanny*, lying in the middle of Pentland Firth, which separates the Orkneys from Scotland; the author observes, that “3,300 ships used to pass *annually* through this strait, previous to the erection of the lighthouse, and many more must probably have passed since that improvement to its navigation.”

We are decided, though Buchanan has conjured up an imaginary being, called *Pentheus*, to give name to this strait, that it took its name from the people who first crossed it, the Picts, i. e. Pictland frith. Long was this strait, through which the Romans under Julius Agricola

sailed when they surveyed the whole maritime coast of Britain, famed for its gorgons and its hydras, its currents and its whirlpools: but these phantoms of ignorance have disappeared; and so little danger is there now in navigating it, that small boats pass and re-pass to Caithness with perfect safety; and by the assistance of the lighthouse erected on Pentland Skerry,* a rock in the mouth of the frith, even at the dead of night.

The Dr. thinks the original inhabitants were some of the ancient Gaulish tribes, which settled in Scandinavia; but materially fails in what he calls a proof of this position. Nothing can fairly be stated from the present names of persons or places, many of which are of a mixed nature: the majority appear of Gothic origin; probably given and imposed by the invaders, as the names in South Britain were changed by the successful Saxons. The difficulty becomes greater on extending our inquiries; because from very early accounts we have of navigation and commerce, these islands are mentioned as inhabited. It appears from good authority that they were known to the enterprising people of Tyre: and even *Thule*, whether it be the Fula of the Orkneys or the Mainland of Shetland, is not unnoticed: and from them the knowledge is derived to the Greeks and Romans. This furnishes a strong argument from analogy, that they were peopled from Britain; and with the Britons had one common Celtic origin, afterwards denominated *Pights* or *Picts* by the Romans: not from their painting their bodies, which has been absurdly supposed; but, as Whitaker has plainly demonstrated, from *their lying without the pale of the Roman province in Britain: from the British word VICT or PICT, as the Pictoria in Gaul, and the Picturians in Caledonia*. And it is not improbable that this term, which signifies *Seceders*, might have been given them by their countrymen, who submitted to the Roman yoke. By this name they were recognized, when they made their irruptions to the south; and by this name they were distinguished by the Britons of the west. They are represented as a tall, fair, comely, fighting people; and so were the Britons. Their language was lost after they ceased to be a distinct people, though still a little of it is preserved in the ancient Erse or Norse: and Dr. Barry ob-

* Another lighthouse is now erecting in Sandey, on the Start point, one hundred feet above the sea, having revolving reflectors.

serves that there are villages yet, which speak a language not understood by the present inhabitants of other places. This origin is confirmed by various monuments similar to those visible in many parts of England and Wales; and more especially by those denominated *Picht* or Pict-houses, found by the northern hordes on their invasion; which still remain, though the present inhabitants are unable to account for their designation. If still further proof were necessary, the similar customs* of the Picts and Britons would be sufficient; particularly the striking one mentioned by Cæsar, and alluded to by Tacitus, *a community, as well as a plurality of wives*. The Dr. allows that the Picts of North Britain and the isles were the same; and though separated as they were from the seat of government, *they might at times wish and attempt to throw off the yoke*; yet there is testimony to shew, that they were tributary to the Pictish kings, till the union took place under Kenneth Macalpine. That these islands were early inhabited, appears from what Tacitus speaks of their having been subdued by Agricola; though Polydore says this was effected by Claudian. And Torfæus's account might be right, who informs us they were discovered 400, and inhabited 260, years before the Christian æra. The progress from families to tribes, and from tribes to communities, is in early population rapid; and under some able chieftain quickly leads to the establishment of monarchy. That they had a government, whether regal or not, is evident; and that they continued under their princes, whether tributary or not, till the subversion of the Pictish kingdom by the prowess of Kenneth II., is equally clear. And though little can be depended upon till after the conversion of the inhabitants to Christianity; yet from that period considerable light is furnished on the subject: and some confidence may be placed in the accounts we have of those times from the accordant testimony of collateral history. We are informed by Adamnan, that they were converted to the Christian faith by means of Columba, a monk of Irish extraction, who resided in St. Kilda. After furthering the extension of the gospel in Pictland, he turned his attention to the Orkneys; and sent Cormac, one of his attendant preachers, to accompany the prince

of Orkney, then at Luckness, the 'palace of Brude king of the Picts, making submission and giving hostages for his future fidelity: who enjoined him, on his leaving the court, to be kind to the *Christian missionary*. Dr. Barry however asserts, that "this event did not take place till after the *Norwegian æra*, under the government of Sigurd II., earl of Orkney;" and the mode in which it was effected, strongly reminds us of that adopted by the Spaniards for christianizing the inhabitants of South America.

"Christianity, some years before this period, had become the religion of Norway, by means of Olaus Frigueson, who then filled the throne. This celebrated prince, being in his youth converted in England, seems to have bestowed on it such attention, as enabled him to perceive its excellence; and he soon became inspired with all the zeal of a new convert, to spread its principles through distant lands. For this end he prepared five or six ships, on board of which he invited such wise and learned men as he deemed best qualified to diffuse the knowledge of his favourite system; and sailed directly for Ireland, with which his country had then an intimate connexion. His transactions there are foreign to our purpose; but on his return, he brought his squadron to anchor in one of the harbours of South Ronaldsay, where the earl then was, in readiness for some expedition. Sigurd was of an open and unsuspicious temper, which arose from confidence in the strength of his arms, and in the magnitude of his fame. He beheld, therefore, the Norwegian fleet without apprehension; nor did he hesitate to go on board as soon as he received the king's invitation, as he dreaded no harm, and supposed, perhaps, that a conference only was wanted, respecting some military enterprise, in which the interest of both of them might be equally concerned. The king's conduct, however, soon convinced him of his mistake; for scarcely had they met together, when Olaus, assuming an air of anxious dignity, opened his design in the following terms: 'It cannot have escaped you, that, as heir to Harold Harfager, I have an undoubted right to the sovereignty of these islands, over which you preside: and you must, moreover, be sensible that both you yourself, and your fortune, are now in my power: but I am so far from wishing to avail myself of these circumstances, that I am inclined to promote your best interest, and to unite you and myself together in still firmer bonds. For this end, my proposal is, that you, and all your people, shall instantly adopt the Christian religion, receive the holy rite of baptism, and acknowledge me as your liege lord: and, on condi-

* Dr. Barry has taken his view of the manners of this people from writers who have professedly written on different nations: and thus from Tacitus and Landanor Bok, Gildas, and Shoketel, formed a motley robe that is neither appropriated to the Picts nor Scandinavians.

tion that you comply with this proposal, you shall secure my friendship ever afterwards; and, what is of far more consequence, the everlasting friendship of the sovereign of heaven. But if you and your people refuse compliance, I am determined to desolate your country, and inflict on all of you the punishment of death; and you will have just cause to expect, hereafter, a punishment infinitely more dreadful, from the hand of an offended God.

"The earl, though confounded at this unexpected overture, and still more at the menaces with which it was attended in case of refusal, yet retained his recollection, and made this firm and spirited reply: 'I cannot, O king, suffer myself to renounce that religion which has been sanctioned by custom, and which I received from my ancestors, as I consider myself as no wiser than they; and no reasons have as yet been offered to convince me, that the religion which you thus recommend for my adoption, is in any respect better than my own.'

"The king had neither time nor inclination to produce any other arguments than those he had used, on similar occasions, in his own country; the arguments of intolerant zeal and despotic power. He therefore drew his sword; and, laying hold of the earl's son, Hundius, whom his father had carried on board with him, declared, in the most determined manner, that he would instantly plunge it into the youth's bosom, if his father hesitated any longer; and at the same time added, that his fate should only be the forerunner of what all those should suffer, who refused to adopt the principles of this religion which he himself professed. Convinced that an absolute refusal, or even any longer hesitation or delay, would have been the certain means of involving himself, his family and country, in one common ruin, Sigurd yielded to the imperious dictates of Olaus, whom he now acknowledged as his sovereign; publicly professed his christian faith, and received baptism; and the people followed the example of their earl, with one accord. The king, exulting in the success of his pious enterprise, now returned home, carrying Hundius along with him as an hostage; and on his departure left some learned men to instruct the inhabitants in the nature of that religion which he had thus planted with the point of the sword. Hundius soon after died, while he was yet an hostage; and the earl, considering this event as dissolving entirely his connexion with that monarch, contracted an alliance in another quarter, by marrying, as his second wife, a daughter of Malcolm, king of Scotland."

Here there appears a chasm, which we think the Dr. might have filled up from unquestionable authorities; and the account of the annexation of the Orkneys to the crown of Scotland under Kenelm, who drove numbers of the Picts of the Main-

land to take shelter in the isles, and there pursued them, would have been interesting information. This would properly have led to the introduction of the Scandinavian dynasty; and illustrated the unjust irruption, and consequent seizure, by *Harold Hufagor*. The Picts and Scots had long, as neighbours, been in league; and intermarriages had frequently taken place between various branches of the two regal families. But what is intended to strengthen the bond of union among nations, is often seen to weaken it; and the root of alliance not unfrequently produces the germ of discord. The Scottish king Achaius had married Fargusia, sister to Hungus the Pictish king. By her he had a son, Alpin, who on the death of Dorstologus and Eogan, the two sons of Hungus, without issue, laid claim to the Pictish crown, by virtue of his maternal title: and Buchanan himself allows, "*that both by old law and right he laid it justly, being by consanguinity the nearest heir.*" The Picts long resisted the Scottish claim of succession; and they had taken the first claimant, Alpin, prisoner, and cut off his head. His son Kenneth pursued his father's track: but he met with numerous obstacles in his way, and many bloody contests took place between him and the Picts: nor was it till after a ten years military struggle, that he could get his title established, and obtain possession of the Pictish crown. However, having prevailed by force of arms, he took his seat; and nearly at the same time, after the death of Dungullus, ascended the Scottish throne. The obstinate resistance they had made, irritated the victors, and numerous were the cruelties and exactions exercised towards the vanquished: many of them fled, and took refuge among their allies in Orkney; which still opposed the title of Kenneth. After he had seized on Fife, Lothian, and other Pictish territories, and placed garrisons for their security, he turned his arms against the islands, which he soon subdued, and added them to his other dominions, A. D. 840. After the Scots had obtained the prevalence, it would be natural for them to cast contempt upon a nation that had so long been their rival in martial prowess; and they would readily countenance every thing tending to diminish the glory of the conquered Picts. But, notwithstanding what is found in the Scottish writers, the Picts were certainly an ancient and brave people; and from the few monuments remaining, they appear, after their con-

version, to have been as pious and punctual in their religious observances as their accusing neighbours. The period at which the Dr. commences the history, is from the arrival of the Scandinavians under *Harold the fair-haired* 876; and this was probably the first time the race of Odin had ever any footing in the isles. On his landing he found *two distinct people*, under the names of *Peti* and *Papa*: respecting the first, our author finds no difficulty, as the Scandinavians call the Picts *Peti*; but is at a loss for the latter denomination. Nor does the idea of Pinkerton, that they were *Irish priests*, appear more satisfactory to him than to us. The islanders had been long, we have seen, converted to Christianity; and previous to the period of which we speak, the church of Rome had made large strides towards absolute dominion. She insisted that the new calendar, tonsure, and observance of Easter, should be adopted by all the western churches. Many, however, objected, and resisted the bull; and a consequent division took place between those who complied, and those who refused compliance. These would be distinguished by appropriate names; *Peti* or *Picts* would allude to the old sort; and *Pape* or *Papists* to the new: like *presbyterians* and *seceders* in the modern kirk. After many hard and desperate struggles, through the blind policy of Donald Bain, it became, in the reign of Olaus, tributary to Norway. Thus a country naturally calculated to defend the north of Scotland, and add greatly to its maritime strength, was ceded to a northern neighbour; which afterwards enabled him to become a formidable, and often successful rival. Boethius makes this cession to have taken place A. D. 1098: if so, the contest must have been sharp and long; and proves that the islanders did not tamely resign their rights to a foreigner.

This part of the history is merely, the Dr. confesses, abridged from *Torfæus*, with occasional remarks from some few other writers: and as *Torfæus* had the means of information, his account, allowing for the bias towards the court in which he was historiographer, *Denmark*, may be relied on as tolerably authentic.

The next æra treats of the transactions in the islands from that time till they became subject to the crown of Scotland. Here it is obvious, if the Dr. be not prejudiced, he has been grossly misled; when he observes, "though *Rodolphus* is certainly mentioned as a bishop of Orkney in

the reign of David; yet the title was then ostentatious only; and William was the first bishop of the see." This assertion however appears to be without the smallest shadow of authority. For if, as he observes, bishops had been appointed by the archbishop of York, it is presumed that they still existed in that character. That they did not reside does not annul their authority; and various circumstances arising out of the times might often occasion non-residence. Nay, if there existed bishops on the Mainland in the reign of Macalpine, is it not as reasonable to conclude, that Orkney, then a distinct government, had, if not bishops, at least *one diocesan*, subject, doubtless, to the archbishopric then removed to St. Andrews? Indeed we think the Dr. should have paid a more pointed attention to the ecclesiastical affairs of the islands, so intimately connected with the real state of a country, and the character of a people. The writers of the Scottish affairs in the time of Alexander, give us a different account. They state, that not only the Isle of Man, and the Hebrides, but also the *Orkneys* were, on the death of Haco, ceded by his son Magnus to the crown of Scotland, in a treaty between the two monarchs, 1263; for which cession Scotland was to pay Norway and Denmark 1000 marks sterling, and 100 marks annually, in compensation for the advantages they had received. Subsequent failure of the annual stipulation occasioned the future contentions, which often subsisted between the northern courts: till the Danes finally and formally relinquished all claim and pretension to the sovereignty of Orkney. From this period *Torfæus* appears to have possessed but few documents, respecting the future transactions in the isles: owing probably to the public records being now diverted to another channel, and finding a place in the archives of Scotland. The author therefore gives us merely a brief chronicle of the failure of the *male* line of the ancient earls of Orkney, in the person of Magnus V.

We have before stated the very imperfect account of ecclesiastical affairs, at which the reverend author only occasionally glances. We regret this the more, because he, from education, habits of life, and station, must have been eminently qualified to give such account; and from his candour in other investigations, we might have expected a considerable degree of impartiality. However confused the state of the times may have been, previous

to 1500, subsequent to that time, till the union of the two kingdoms in the reign of Anne, three aras were formed by events in which Orkney must have materially shared:—the Reformation,—the re-establishment of episcopacy,—and the means which led to establish the kirk; and to make the episcopal, a dissenting, church in Scotland. Information on this subject, connected with the isles, would have been gratifying.

In Book II. Chap. V. Dr. Barry treats of some monuments of antiquity. "Over the islands," he says, "are dispersed many single stones, rude as out of the quarry; in two places triads, and in one instance with one of the stones thrown down." These he allows to be the most ancient of this country; but he attributes them to a *Scandinavian origin*.

The *circular and semicircular monuments*, many of which are still to be seen, he supposes of *much later date*: and contrary to the generally received opinion, terms them *Gothic structures*: on this subject, he says:

"They have indeed been considered as druidical temples, according to a fashion which, for half a century past, has prevailed, to ascribe almost every monument of antiquity to that extraordinary order of man. But had these been the authors of such monuments, history would not have been silent on the subject; which constantly mentions their having no temples whatever, and worshipping the deity in groves only. Besides, had they been places of worship peculiar to that celebrated people, they would naturally have shared the same fate with themselves, and been razed to the foundation, as soon as the priests that had officiated in them were destroyed. That this had not been the case, is evident; for, in the south, as well as in the north, they remain still entire; and had they then existed, and had any connexion with that people, Tacitus, when he mentions the destruction of their groves, would not have failed to have taken some notice of them also. * The very date of some of them in Scandinavia is moreover well known;† and the use of them pointed out by the writers of that country, who inform us, that they are denominated, in popular language, *tings*, or courts; and that they are places appropriated for the administration of justice, and the oblation of sacrifices. 'A judicial circle stands there, where men were doomed to sacrifice.'—* There Thorder Galler erected a court for one quarter, by the consent of all the men of that quarter.† These circles and semicircles, therefore, or the stones erected into these

forms, are to be considered as intended to serve the double purpose of temples and courts of justice, or places for assembling large bodies of people for various ends; and they are plainly to be ascribed to those nations that were of *Gothic origin*. Though their form is similar, they are very different in their dimensions, according to the purpose for which they were designed. In the largest class we may certainly rank Stonehenge in England, which is unquestionably the most superb and magnificent object of the kind; and which, if it be not the burial-place of the celebrated Saxon, as the name seems to import, might have been the place for the meeting of their national assembly, as they met in the open air.‡ To the same class may be referred that noble circle of *Classemis* in the *Lewes*,§ which may have been a court-house, in which affairs of importance might have been transacted, relative to the interest of the community. ¶ Their kings and chiefs were also sometimes elected in these large circles; while the lesser ones were used as temples of the inferior gods, and not unfrequently as family burying-places. ¶ It might have been naturally expected, that some such objects would have existed here, as the country had been so long occupied by the same people who had erected and used them in other places. And accordingly in many places are seen small circles, but without stones around them now, whatever might have been formerly; and the islands possess also their *Classemis*, and even their *Stonehenge*, which, though often visited, and sometimes described, is still but little known."

Among these monuments, that called the stones of *Stennis* claims the principal attention. It consists of a semicircle nearly 100 feet in diameter, surrounded by a mound of earth; with single stones standing erect in the interior, and is situated on the eastern side of the loch *Stennis*. On the western side is a complete circle 300 feet in diameter, surrounded by a ditch twenty feet broad, and twelve deep; and on the inside, by a range of standing stones twelve and fourteen feet high, and four broad. These are accompanied by four barrows of considerable magnitude, and other erect stones on the margin of the lake. "Of the flat stone lying in the centre of the semicircle, there can be no doubt as to its use;" and the Dr. thinks, "the round hole discoverable in one, whose edges are worn, as with rope, was for the purpose of binding the victim, usually, we suppose, immolated on this very altar."

This is certainly a very curious monu-

* Tacitus. † So Mr. Thorkelin told Mr. Pinkerton. ‡ Islands Landnama Bok.

§ Tacitus. § Martin, Western Isles. ¶ Wormius, Olaus Magnus, and Dalberg Suecia ant. et hist.

ment, and from its form evidently coeval with similar ones found in England and Wales; as Stonehenge in Wiltshire; Rolich in Oxfordshire; Buarth Arthur in Caermarthenshire, &c. &c.; if not with the stupendous and venerable temple at Avebury in Wiltshire. But when our author asserts that these, which have been supposed *Druidical*, must belong to the same people from whom all things else respecting this country are derived, i. e. the Scandinavians, we think he completely begs the question. For he allows, "that till centuries after the Christian æra, little of a certainty is known of the Orkneys." Had we known more, perhaps we might have found, that these Celtic priests, *the Druids*, had footing in these, as well as all other parts of the British isles. There is nothing contrary to such a supposition; and it is rendered highly probable by the existence of similar monuments in those parts, where they have been acknowledged as residing. We can have no objection to join the Dr. in supposing them *Taings*, or *Courts of Judicature*, though not exclusively so: for we find in the early history of almost every people, that the sacrificial, legislative, and judicial characters, were often vested in the same persons. Long were the two last united, nor was it till very lately, that the government of this free country arrived at that rational system, where the enacting and executing powers were separated. Nothing can be justly inferred from the observation that the *druids worshipped in groves*; for these temples might have stood in extensive groves, before the country was deprived of wood: or, what is more probable is, that, terrified by the sword of the invaders, the peaceable ministers of religion retired into the fastnesses of the forests; both for the security of their persons, which were threatened, and for the purpose of quietly performing their devotions, and delivering their instructions. "But if they had been *Druidical*," Dr. Barry observes, "history would not have been silent." Has it then been silent, because they were Scandinavian? Not only on this, but on many other important points relative to early manners and customs, we have found history silent, or very imperfect in its details. Even the Dr. finds it will not furnish him with one single document to prove that they were the works or temples of the Druids. Had any thing of this kind been adduced which might have emitted one ray of light on this obscure subject, we should

have felt highly gratified. The matter is still *lis sub judice*: and though, after reading both sides of the question, and examining many of the monuments in dispute ourselves, we are of opinion, that analogical circumstances are in favour of the British origin: yet we hold ourselves still open to conviction: and solicit the lovers of truth not to be weary of investigating this early and interesting part of our history. That the temples must have shared the fate of the priests who administered in them, is absurd; because it is contrary to facts recorded in history on similar occasions: and because, if the objection be allowed, it will equally apply against their Scandinavian, as well as druidical origin: our author admits they were *religious temples*, for "sacrifices were offered up in them;" and we suppose by priests, whatever their origin or denomination.

Various *tumuli* or *barrows* are found in many of the islands, in which, when opened, have been discovered bones, urns, stone coffins, &c. These are of a mixed nature, and probably belonging to more than one people; this being a mode of burial in early times, whether of persons slain in battle or not. Stone coffins were not peculiar to the Britons; nor urn burial to the Greeks and Romans.

The *Pight* or *Pict-houses*, as they are termed, are more curious still, as they shew that the persons, to whom they must be attributed, were probably the original inhabitants, who were a race unknown to the people of the north. These are numerous, and are found on the holmes in the midst of lochs, with a stony ford or causeway attached, as a passage to them; on the points of very high lands; or on strands on the sea-shore, more especially near places adapted for landing with facility. Their situation points out their intention: they were evidently the barracks or habitations of those appointed for the defence of the isles against invasion, or the depredatory warfare of their roving neighbours; and what confirms this is, that they stretch in a regular chain from one headland to another, in a full view of the adjacent harbours, and distant ocean. Though many of them have been demolished, yet sufficient still remain to shew the nature of their structure, and demonstrate their use. As these ancient remains have been so little understood, and are singularly different from those objects which have principally engaged the attention of antiquaries, we shall give Dr. Barry's description of a large one (for

they vary in size) lately discovered at Quanterness.

"As works of that nature have never been clearly understood, though they have excited much curiosity in men who take pleasure in studying the progress of the human mind, by looking back to early ages, the utmost attention has been given to examine that Pict-house with care, to measure its dimensions accurately, and to delineate the form of all its parts with precision. Situated on a gentle declivity, under the brow of the hill of Wideford, it looks toward the north isles; has a full view of the bay of Frith, and the pleasant little island of Dansey, from which it is not far distant, and lies little more than a mile west from the road or harbour of Kirkwall. Like the rest it bears externally the form of a truncated cone, the height of which is about fourteen feet, and the circumference at the base three hundred and eighty-four; but whether, like them also, it be surrounded by one or two circular walls, the quantity of rubbish prevented us from discovering, though, that it is so, is very probable. In one respect it differs from most of them, as it stands alone, and at a distance from the shore; whereas in general, they are situated on the shores of the sea, and several of them at no great distance from, and in full view of, one another, as if they were some way or other connected, or had been intended for mutual communication.

"Internally it consists of several cells or apartments, the principal one of which is in the centre, twenty-one feet six inches long, six feet six inches broad, and eleven feet six inches high, built, without any cement, with large flat stones, the one immediately above projected over that below, so as gradually to contract the space within as the building rises, till the opposite walls meet at the top, where they are bound together by large stones laid across, to serve as it were for key-stones. Six other apartments of an exactly similar form, constructed with the same sort of materials, and united in the same manner, but of little more than half the dimensions, communicate with this in the centre, each by a passage about two feet square, on a level with the floor; and the whole may be considered as connected together by a passage of nearly the same extent from without, which leads into this chief apartment. So far as can now be discovered, there does not appear ever to have been, in any part of the building, either chink or hole for the admission of air or light; and this circumstance alone is sufficient to shew that it had not been destined for the abode of men. The contents were accordingly such as might have been naturally expected in such a gloomy mansion. None of those things which have been discovered in similar places, were found here; but the earth at the bottom of the cells, as deep as it could be dug, was of a dark colour, of a greasy feel, and of a fetid odour, plentifully inter-

mingled with bones, some of which were almost entirely consumed; and others had, in defiance of time, remained so entire, as to shew that they were the bones of men, of birds, and of some domestic animals. But though many of them had nearly mouldered into dust, they exhibited no marks of having been burnt; nor were ashes of any kind to be seen within any part of the building. In one of the apartments, an entire human skeleton, in a prone attitude, was found; but in the others, the bones were not only separated from one another, but divided into very small fragments."

A ground-plan accompanies the description, with admeasurements of the seven apartments.

In the natural history of the Orkneys, Dr. Barry observes,—"There would be no great difficulty in giving a full and complete statement of the various productions that are to be found in the animal, vegetable, and mineral kingdom." The public may lament that the Dr., as he found the task so easy, has not performed it: for there cannot be a question, that next to the history of man, a description of the surface of the planet he inhabits, and its multifarious productions, must be considered of importance: and if the account would not have amused the ordinary reader, it would have augmented the stock of natural knowledge. For we are not, and probably others will not be, convinced, that "if persons well skilled in the knowledge of natural history were to examine these islands, they would have soon to conclude, that little new was to be expected from this country." This may be an apology for his declining to investigate such subjects, because they may appear to him uninteresting; but we must object to this illegitimate mode of closing the book of science, this mode of damping the ardour of the more scientific and indefatigable traveller.

Dr. Barry's mineralogy of the islands is an abridgment of Jameson's account of the mineralogy of the Shetland and Orkney Islands.

Next follows a list of indigenous plants, with their English names: but without even classical arrangement. The index is confused indeed, and seems furnished by some other hand; as the trivial names differ. The English names, which belong to particular species are frequently placed opposite the genera. This must tend to mislead persons not well skilled in botany. Thus Devil's-bit is put opposite to *Scabiosa*, though it belongs exclusively to *Sedum succisa*; Primrose to *Primula*, though it

applies only to *P. Verna*, &c. *Beta maritima* is here called *vulgaris*, though growing on the sea-shore. In the list of plants we find none but what are described in the *Flora Scotica* of Lightfoot, unless *Plantago uniflora*, and *Gallium montanum*, may be considered exceptions. The Habitats are general, except a few particularized in the island of Hoy. They however appear in some instances, different from those generally known to botanists, viz. the Habitat of *Alchemilla vulgaris* is given—"Banks of Rivulets;" *Sagina procumbens*, "Houses and Walls;" *Hedera Helix*, "Banks of Rivulets;" *Spergularia arvensis*, "Marshy;" and *Thalictrum minus*, "Sandy Places." If these are from actual observation, they are valuable information; if not, they are without authority. The Doctor professes "to leave such discoveries to those who have more time and leisure for such researches."

Our author's zoological remarks commence with the finny tribes; and, as might be expected from the situation of the isles in the northern ocean, the grand store-house of fish, it is a prolific list. But we do not notice one in the enumeration, which has not been described by the laborious Pennant in his *British Zoology*. In the references to names, the Doctor sometimes quotes the *British Pliny*, and at other times resorts to the system of *Linnaeus*: a motley mode of elucidation we cannot account for.

From the surface as well as the situation of the country, abounding with marshy lands, lochs, &c. and accompanied by desolate holmes and skerries, maritime, emigrating, and rapacious birds, are very numerous. But in this list we find not a single non-descript: all are equally well described in Pennant: a few haunts peculiar to Orkney are all that is new on this subject.

The islands abound with rabbits, though destitute of hares: and the Doctor supposes there might have been deer formerly, because the horns of that animal have been dug up in peat grounds. They are unmolested by the ravenous wolf, and subtle fox: and except the poor calumniated toad, no venomous animal finds an asylum in the Orkneys.

Among domestic animals the hog claims the first place. He is represented as very different from the ordinary race of pigs; and though ugly in appearance, and injurious in his habits, yet he fully compensates for these imperfections, by the flavour of his flesh, and the utility of his

hide. His bristles are made into ropes, which are applied to different purposes.

The sheep of the Orkneys are similar to those of the Shetland isles; and though they are suffered to run wild, subject to the intemperance of a cold climate, yet their wool is tolerably fine; but the flesh is indifferent. They are prolific, bringing forth two, and sometimes three, lambs at a time: and they prove the fallacy of the theoretical and unfounded assertion of Buffon, that this animal cannot live without the fostering care, or even the protection, of man.—No more attention is paid to the young than to the full-grown animals: for while many of them are suffered to become the prey of birds in the distant holmes, those nearer home are not made the most of. They never wash the sheep previous to shearing, but take the wool from the animal by rowing; which Dr. Barry considers as a cruel custom; and it is still practised in Orkney as well as in Iceland. Dr. Anderson, however, considers "this as a most rational method for this breed of sheep; which, he says, is the most uncontaminated race of wool-bearing sheep he has yet met with: the wool rising so entirely from the skin about the beginning of June, as to render the shearing of their sheep unnecessary. For it may be plucked off at that time without occasioning the animal the smallest uneasiness: as it will fall off of itself, if not taken away; the young wool springing up beneath it like a newly shorn fleece." Bath Soc. Papers, vol. viii. Though the wool is fine, the fleece is very light, even when compared with the diminutive size of the animal; seldom reaching, and never exceeding, one pound and a half per fleece; and when washed, little more than one pound. Most of it is manufactured in the islands into coarse cloths, stockings, &c. principally for domestic uses, with some little for exportation.

The oxen are small, though useful for labour; and their cows, though poor, are well milked. When fatted, an ox seldom exceeds 60lb., and a cow seldom reaches 45lb. per quarter.

Horses were formerly all purchased from Scotland, and the injurious practice still in part continues: whereby quantities of ready money are drained from the islands, so requisite for necessary improvements; while they have so much cheap land which cannot at present pay so well as by depasturing breeding-cattle.

If the accounts of levies for armies be a just criterion of the numbers of a people

in any country, the population of Orkney in ancient times must have far exceeded the present. If they could furnish 10,000 fighting men, the present number of inhabitants, 24,000 from actual survey, is a diminished population indeed. However, from present appearances in the islands, and a retrospect of former enumerations, there is reason to suppose the accounts have not been greatly exaggerated. Though Dr. Barry thinks the population has been for centuries stationary, yet he invalidates immediately his own position, by observing that emigration has for many years been increasing, and is at this period very great; not less than from 400 to 500 of the youth annually quitting the country. "If this were not the case, the population, instead of being stationary or retrograde, might increase to 40 or 50,000 in the course of a few generations." Why, we may ask the Doctor, this might not have been the case at the time when the inhabitants lived under the fostering care of a race of earls, who, being resident among them, were desirous of their welfare: under an equitable constitution at home, by which they enjoyed a lucrative commerce, and protected by the most potent monarchy then existing in the north? Nay, Dr. Barry's oracle, Torfæus, informs us, that they not only had the advantage of a free commerce with most nations; but that they were enabled to build several large ships, and to pursue an extensive trade for themselves! Our author classes the present inhabitants in three divisions: gentlemen; tradesmen and shop-keepers; and cultivators of the soil, with their attendant cottars or cottagers. The first, he thinks, do not pay sufficient attention either to cherish a spirit of industry in the lower and middling classes, or to set a profitable example. The ladies of the Orkneys, however, receive a high, and, we doubt not, a just encomium for their domestic virtues and exemplary piety. Of the second-class, he observes, they are often accused of exorbitancy in their demands, and dishonesty in their dealings; yet to an impartial observer they will be found in the general as respectable as most in the same line of life. The cultivators of the soil, who make about eight-tenths of the people, are represented as very poor, and possessed of but little stock, and fewer means of increasing it. If idleness should be prevalent, and agriculture at a very low ebb, it must cease to be matter of surprize; for it is the possession as well as the hope of wealth that is a stimulus to

labour, and the great encouragement to industry. While the greater part of the money is drawn away from the islands by the great proprietors, or spent in useless luxury by those resident, much amelioration, either of the soil or the condition of the people, cannot be expected. In enumerating the obstacles to improvement, the Doctor adverts to the feudal system, which, though it perhaps never prevailed here to its full extent, yet a remainder of it is still visible in rents being paid in kind, and labour obtained as services, and the ancient and long-sanctioned usage of stiet-bow, that is, a quantity of stock delivered by the landlord for the use of the occupier of the farm on his quitting it, which, on quitting, he is bound to restore, seems to confirm the same. And if feudal tenures were only known after the Reformation, either here or in Scotland, what is the meaning of the extract of a charter of Robert I. quoted by Nisbet, in which Adam Adamson and his four sons are declared free? Nay, to this very hour, Dr. Barry assures us, the peasantry are the slaves of their masters, not by feudal, yet by prescriptive bondage.

The tenures previous to this period were udal, and the proprietors were called udallers, which the author derives from two Gothic words, signifying ancient property. But may it not rather come from the British words udd lard or master and all, meaning the whole, i. e. complete proprietors? Buchahan mentions them in the *Proceres Orcadium*, the Nobles of Orkney. The progress of feudal tenures, if it commenced at the Reformation, must have been rapid; for udal or allodial estates are almost obliterated, nearly the whole of them being now in fee or feu.

The farms of Orkney are small; seldom exceeding forty acres, and often less than ten, with a portion of waste ground for pasture. Their instruments of agriculture are extremely awkward, their mode of ploughing bad, and their neglect of manures notorious.

The custom of herrying, that is, paring off the sward from the grass lands to mix with sea-weed for manure, is truly a most injurious custom: for, after all the labour and expence of the husbandman, the damage to the grazing part of the farm is more than equivalent to the advantage derived to the arable lands.

A more rational husbandry has, however, been partially introduced; several new sorts of seed have been tried; and turnips have succeeded beyond expecta-

tion. A curious fact is here also stated, "that neither the black fly, nor any other destructive insect, nor the aubery, is known, nor do they seem liable to any other distemper." Flax is but partially cultivated; and hemp has hitherto been totally neglected. Though we remark many defects in the agriculture of the island, yet we felt happy in being informed, "that the annual produce is more than adequate to the consumption; and though, from failure of crops, grain has in some years been imported, yet on the average of years the importation has never been equal to the exportation: and if the lands were properly cultivated, it would be adequate to fourfold its present population."

If its agriculture be at a low ebb, its manufacture and commerce are still more so: for except linen-yarn, the flax for which is principally imported, and the burning of sea-weed for kelp, there is none deserving the appellation. A pleasing description of the latter manufacture is given by Dr. Barry, p. 371. Their exports and imports, though few, have been increasing these last thirty years.

Our author closes his account with the fisheries, which, in common with other writers, he describes as most miserably neglected. This must be the more regretted, because the encouragement of them would not only call forth the latent energies, and produce considerable wealth, but become an admirable nursery for the bulwark of Britain, her extensive commerce and her formidable navy. The situation of the islands is peculiarly adapted for such an establishment upon the most extensive scale: and nothing can so much contribute to the welfare of a country as the encouragement of such branches of trade as are best adapted for the situation of its component parts. To this wise policy was it owing, in a great measure, that the Dutch, with a territory neither large nor naturally rich, raised themselves to a degree of consequence, which long rendered them an object of wonder and envy to the surrounding nations. Though most of the plans Dr. Barry points out as modes of amelioration have been suggested before, particularly in that invaluable work, *The Political Survey of Great Britain*, yet they are urged with additional force by the accompanying remarks. Nor can there be a doubt, that if they were adopted, and all ranks arduously connected with the country were to concur in the measures, a very general and ex-

tensive improvement would soon take place: we should behold with pleasure a more interesting order of things; agriculture, trade, commerce, and navigation, would be rivalling each other; the inhabitants would become more numerous, more industrious, and more happy; and Orkney, instead of an useless province, become a valuable portion of the British empire.

Dr. Barry's language is generally good, and his style, though not energetic, tolerably perspicuous. A few quaint expressions, such as, "both one and the other" for both—"two weeks" for a fortnight—"in time coming" for in future—"operated these changes" for effected these changes—"as fast as they could" for with haste, disfigure the style; and the recurrence of such words as follow destroy the purity of language: feued for held in fee—tannery for tanyard—advices for opinion—transference for transfer—contentment for content—pendicle for a rocky isle separated from another by some supposed convulsion of nature. Astricted can never properly explain the provincial term thirled, meaning the law by which so many farms are bound to support a mill. These are, however, trifling blemishes, which in a future edition may easily be removed. We notice them, because the authority of such a writer might sanction their use.

On the whole we must observe, that the author in this work has brought together much useful information, on a subject but little known; and where we have not been instructed, we have been generally pleased. Notwithstanding we have been under the necessity of objecting to several of his opinions, and of decidedly refusing to acquiesce in referring every thing to Scandinavian origin, yet we think he possesses great merit; and the *History of the Orkneys* may be ranked among the many valuable acquisitions to topography has received within these few years.

We have just heard the unwelcome intelligence that the learned author, while the work was making its appearance, paid the debt of nature: and therefore any further elucidation of the history and present state of this interesting part of the empire must be looked for to another quarter. We feel indebted to Dr. Barry for what he has done, ardently wishing he had possessed more time to have furnished the world with further information; and

while we regret that his must now be posthumous fame, we hope that his family will be materially benefited by his indefatigable labours.

ART. II.—*The Architectural Antiquities of Great Britain, displayed in a series of Select Engravings, representing the most beautiful, curious, and interesting ancient Edifices of this Country, with an historical and descriptive Account of each Subject. By JAMES BRITTON. Parts 1, 2, and 3. 4to.*

UPON the subject of *English architecture*, though much has been already written, still more is left to be explained. The observation of Quintilian, however, is not applicable here. It was his remark,

'Felices essent artes, si de illis soli Artifices judicarent.'

But to elucidate the history of our ancient structures, more knowledge than the architect possesses is required. The task of investigation demands the antiquary's aid; and goes much farther than the mere principles of mechanism on which the buildings, however simple, were constructed.

The history of the art begins with us but at a late period. Of its existence among the aboriginal Britons we can say but little with exactness. With the exception of Stonehenge, and a few huts in part built of stone, though raised entirely without the use of mortar, we have no remains which evince to us either the efficacy or extent of their mechanic powers: and though a new and a surprising change ensued on the arrival of the Romans, we have reason to believe that few of their best works were ever erected in their provinces. Indeed, the specimens of Roman art with which this country was adorned, could not have been extremely numerous, unless we suppose the subsequent inhabitants to have exterminated every relic which might have marked their subjection at a former period: and of this it does not appear that we have proof. For instances occur, in various parts of the kingdom, where the Roman style and manner have not only been copied by the Saxons, but their very materials adopted, and worked sometimes into the old, and sometimes into a new form.

But a systematic and progressive view of English architecture, formed upon correct data, can only begin with the more regular structures of the Saxons. To speak of these however, as built in a style peculiar to the Saxons, is wrong: for though a few of their mouldings may have a character appropriate to themselves, the outline of the style was, at that day, the common architecture of the whole of

Europe; and is as strongly marked in the more ancient churches of Italy, as in the older parts of the Moorish palace of Alhambra. After the arrival of the Normans an enlarged style was introduced; the first instance of which had before appeared in the abbey church of Westminster, constructed by Edward the Confessor: in a short period it attained the height of its perfection, and was suddenly succeeded by a style essentially different in every leading feature; the earliest and the best specimens of which, in all its periods, are only to be seen in England. The arch, instead of round, became pointed like a lancet, while the shaft that supported it was slender: in some cases the column became octangular; and in others, its massive form was gradually changed into a cluster of small ones. Practice and refinement appear to have given new beauties to the style we have described; and in the course of two centuries it arrived at the summit of its perfection as a science. The introduction of stained glass coalesced in the production of effect, and gave new and extended modifications to many of its parts; till profusion of ornament, detracting rather than adding to its real character, it declined: and in the reign of Henry the eighth the Greek style was introduced.

Such, and so ample, is the field in which Mr. Britton has engaged to exercise his talents; and if we may judge from the specimens he has already given, a curious and a valuable work will be at length produced; formed upon certain data, and uninfluenced by theoretic bias. He sets out with no favourite system to support, nor does he yet pretend to present the reader with any thing like a progressive view of our architectural antiquities. Detached specimens are taken from different periods, and the exact times both of their original erections and subsequent alterations are correctly ascertained. The more interesting parts, as well as the *total ensemble* of the building, are given in distinct plates; and each description left unpaged, either to suit the convenience of the amateur, or to combine more easily with the general history, which we presume will hereafter form the preface.

The buildings already selected are as creditable to the talents of the author as to the graver of the artist, and we cannot speak in terms too strong to do justice to their merits.

The first part opens with several views of the priory of St. Botolph, Colchester; a structure in itself anomalous: since in the midst of Roman materials it exhibits a singular deviation from the general specimens both of the Roman and the Saxon styles. Mr. Britton refers its erection previous to the reign of Henry the first; though the priory was founded about the year 1102. The selection in this instance has our strongest approbation, as the subject forms a complete study of itself, not only to the antiquary but the curious artist. The priory at Dunstable, in Bedfordshire, forms another specimen; and its architectural history we believe has never before received so much elucidation. Its most curious feature is the western front; which may be considered, Mr. Britton observes, as one of those architectural paradoxes bequeathed by our ancestors to puzzle modern antiquaries. In the lower part of the building is a grand arch, acknowledged to be of the time of Henry the first, which merits attention not more for its antiquity than its enrichments. An adjoining door-way is evidently of the thirteenth century; and Mr. Britton fixes its date at 1273. The columns, arches, pedestals for statues, mouldings, and ornaments composing the decorations of the battresses, recesses, and gallery of the exterior, are of the earliest pointed style, as are the ornaments at the base of the belfry tower: while the tower itself, with its variegated masonry, and the battlements on the body of the church, indicate the mode of building peculiar to the sixteenth century. The third specimen exhibits the tower gate-way of Layer Marney Hall in Essex, and shews the state of domestic architecture in the reign of Henry the eighth; when the dissolution of the monasteries occasioned an extraordinary change in the features of the time. The real castellated character of a baronial mansion was now no longer seen, though a few of its peculiarities were retained. The gate-way, with two octagonal projecting towers, above seventy feet in height is now the principal relic of Layer Marney mansion. It is of red brick with chequered compartments of flint; and, like the gate-way which till lately remained in the same county, at Nether Hall, displayed much grandeur

and external dignity. The last specimen in the first number is the church of St. Nicholas at Abingdon, supposed to have been built about 1300 by abbot Nicholas de Coleham. The circular door-way, however, at the west end, with zig-zag ornaments, is supposed by Mr. Lysons, in his *Magna Britannia*, to be of a much earlier age.

The second part of Mr. Britton's work is entirely devoted to King's College chapel at Cambridge: it is illustrated with a plan, sections, and views; and from the nature of its details, will be as acceptable to the professional enquirer as to the antiquary.

"It was observed by Dr. Henry, that there is a certain perfection in art to which human genius may aspire with success, but beyond which, it is the apprehension of many, that improvement degenerates into false taste and fantastic refinement. This axiom is amply exemplified in the history of ancient architecture. The heavy simplicity of the Saxon was supplanted, in the twelfth century, by the lofty magnificence of the *pointed* style: but three centuries after, magnificence itself was exhausted, and the chapel of King's College is, perhaps, the only specimen in which the *perfection and decline* of what has been absurdly termed the Gothic style may be completely seen. In the eastern part of the structure, we have the most elegant and pure example of the art. Here decoration is sufficient, without profusion; and the greater and smaller members are judiciously proportioned to produce that architectural symmetry which at once pleases the eye and satisfies the mind. The western part of the building, though executed in the same style, is rather too much encumbered with ornament; and the wood-work skreen which separates the chapel into two parts, serves only to show that the good taste which guided the original architect, a century before, had departed in the days of Henry the eighth. This displays the Italian or Melange style of building, which was principally brought into fashion by Hans Holbein and John of Padua.

"Henry the sixth, who all writers seem to have allowed would have made a better figure in a cloister than a court, was only nine months old at his accession to the throne. In his natural disposition he was weak and ductile, though, at the same time, more deeply tinctured with devotion than was common, even to the general complexion of the times. The kings, his predecessors, who were less pious than himself, had been liberal, even to extravagance, in the erection and endowment of religious houses; and Henry, who, to a piety which was little encumbered with state transactions, added the zeal and generosity peculiar to youth, endeavoured, in the present work, to eclipse their efforts. His first design for building was upon a small

scale, yet afterwards he extended it so largely that Henry himself forewore it could not possibly be finished in his life-time. He left instructions, therefore, with a view to its completion, in his will; and detailed a plan which while it reflects the highest credit, at least on the grandeur of his devotional ideas, evinces that, though the architects of those times were unguided by the cold rules of proportion, they still worked upon acknowledged principles: and reconciled solidity and lightness with a better grace than the best artists of what may be termed the classic æra. It is enough to say they understood *effect*, and that in their efforts to attain it, they never weakened the buildings they erected.

"Henry's first foundation, in 1411, was for a rector and twelve scholars only; but his second was for a provost and *seventy* scholars, who, owing to the incompletion of the monarch's designs, were long confined to the few and inconvenient apartments provided for the smaller society. The plan which Henry had projected in the second instance, was proportionable to the number of people for whose maintenance he had made provision: but a *part* of the chapel only, which formed the north side of an intended quadrangle, was all that the troubles of his reign allowed him to erect. According to Henry's will, the chapel itself was to contain, in length, two hundred and eighty-eight feet of *'assize'*, without aisles; and all of the width of forty feet. The walls were to be ninety feet in height, embattled, vaulted, and *'chare-roffed'*, sufficiently buttressed, and every buttress finished with purfled pinnacles or little spires with flower-work. The window at the west end was to have *'nine days'*, and the windows in the sides five days: betwixt every buttress in the body of the church, on both sides, were to be *'closets'*, or small side chapels, with altars; they were to be in length twenty, and in breadth ten feet, and the pavement of the choir was to be a foot and a half above the pavement of the church.

"How far this building was advanced previous to Henry's death is not satisfactorily ascertained, though it is generally admitted that the eastern end was raised some feet above the ground, and a small portion of the north and south walls were built. The rest was left for his successors, though the whole was not entirely finished till after the year 1530."

The expences of the undertaking are next detailed: but as they were in part printed by Malden, we shall not extract

them here. The sums accounted for between 1479 and 1515, amount to no less than 13,624*l.* 4*s.* 3*d.* exclusive of the painted glass and the fitting up of the interior of the chapel. The ground-plan, with the groining of the roof, forms one of the most curious illustrations in the plates; and the view of the interior from the screen, does great credit to the artist who engraved it. The appendix contains such parts of the will of Henry the seventh, as throw light upon the history of the structure, with the indentures relating to the building.

The last which we shall here notice, and perhaps the best, is the third part, in which we have an *'essay toward the history of temples and round churches.'*

"Among the most ancient (if not really the very first) species of *circular temples*, were those rude piles of stones, which are usually denominated druidical.* These are almost uniformly disposed in a circle, and consist of one, two, or four concentric rows of upright *unwrought* stones.† Several of these, of various dimensions and figures, are still remaining in Wales, Cornwall, Cumberland, Scotland, Ireland, and other parts of the British islands; also in Brittany, Denmark, &c. but the most considerable in size, and popular estimation, are those of *Stonehenge*, and *Avebury*, in Wiltshire. The former has obtained extraordinary celebrity; but the temple at the latter place, though upon a *much more stupendous scale*, and surprising plan, is seldom alluded to by antiquaries, and scarcely known even to Englishmen.‡ Its centre consisted of a *circular range of immense stones*, one hundred in number, with *four other circles* within the area. The whole was environed with a deep ditch, and high bank. Diverging from this were two avenues, or double rows of upright stones, which extended a mile each way from the centre, and at the extremity of one of these avenues, were two *oval* ranges of upright stones."

After this Mr. Britton briefly notices a few of the temples in other countries, which were built upon the circular plan; and particularly points out to notice those which were erected by the Romans. The most popular of these, he observes, was the Pantheon, commonly supposed to have

* "Moses rose early in the morning, and buikled an altar under the hill, and twelve pillars." Exodus, chap. xxiv. v. 4. See also the first volume of King's *Munimenta Antiqua*, where the author has described, and referred to, numerous stone circles, or temples.

† Stonehenge, I believe, is the only example in Britain, where the stones have been squared, or shaped with tools; whence the Welsh antiquaries infer that it is not a purely druidical structure.

‡ Stukely wrote a dissertation on it, which he published in a folio volume, with numerous plates, in 1743; but as this work is scarce and dear, it is only to be found in the libraries of the curious, and consequently is only read by a few persons.

was erected by M. Agrippa; though Pallas is of opinion, that the body, or circular part, was built in the time of the republic, and the portico only added by Agrippa. It was repaired A. D. 607, dedicated to the Blessed Virgin, by Pope Boniface IV.; and, in three years after, it was again dedicated to all the saints by Pope Gregory IV. From these Britton proceeds to the *round churches* of England, which not only constitute a singular and rare class of ancient edifices, but are eminently interesting to the architectural antiquary.

The origin of round churches, in England, has been generally attributed to the Saxons. This opinion was very prevalent in Cambridge, till Mr. Essex corrected it by his historical observations, which were published in the sixth volume of the *Archæologia*. 'Their temple at Jerusalem,' he observes, 'is not of the circular form, neither was the tabernacle of Moses; nor do we find the modern Jews affect that figure in building their synagogues. It has, however, been generally supposed, that the round church at Cambridge, that at Northampton, and some others, were built, for synagogues, by the Jews, and that they were permitted to dwell in those places; but as no probable reason can be assigned for this supposition, and I think it is very certain that the Jews, who were settled in Cambridge, had their synagogue, and probably dwelled together, in a part of the town now called the Jewry, so we may reasonably conclude, the round churches we find in other parts of this kingdom were not built by the Jews, for synagogues, whatever the places may be called in which they stand.' As these churches are evidently not of Roman architecture, and as they were not erected by the Romans, we are naturally curious to ascertain when, and by whom, they were built. There appear to be four perfect examples of these buildings in England: St Sepulchre's church at Cambridge, St Sepulchre's church at Northampton, the Temple church London, and a small church at Little Maplestead, Essex. All these, with one that was at Temple Bruer, and one at Aslackby, Lincolnshire, are generally attributed to the knights Templars, during their power and prosperity in England. This singular religious order of 'knights-errant' obtained their organization and fame in the vicinity of the church of the Holy Sepulchre at Jerusalem.

"It is the general opinion of writers,

that this sacred structure was built by Helena, the mother of Constantine the Great; but, unfortunately, none of these writers have identified the part then built, or described its size, character, or style of architecture. Besides, we are informed that Charlemagne, (A. D. 813.) *rebuilt* this venerated edifice. 'The east end,' observes Mr. Essex, 'I take to be of his building, containing the semicircular tribune; but the intermediate part, between it and the sepulchre, is more modern, and might be rebuilt when the church was restored, in the year 1049, after it was defaced by the Saracens towards the end of the tenth century.'† Bede, speaking of this structure, describes it as a large *round church*, with *three walls* and twelve pillars; but the precise disposition of these walls and pillars is not specified.‡ The round part of the present building materially differs from this description. It consists of a semicircular wall, which attaches to a large mass of buildings on the east, and a little within the wall is a circular colonnade, consisting of sixteen columns and piers, with an open space for four others, towards the east.§ The circular part of the building is of Roman architecture, and its roof, which is mostly of cedar, gradually diminishes from its base upwards, and terminates with a round aperture. This shape is rather singular, as it differs from the usual form and construction of domes, or cupolas. The other parts of the building consist of several chapels, oratories, passages, towers, &c. and on the south side is displayed several examples of *painted arched doors* and *windows*, with corresponding *clustered columns*. Sandys, Le Bruyn, and Maundrell, who have all visited this place, are so extremely vague and unsatisfactory in their respective accounts, (I cannot apply the term of *history*, or *description*), that they prove more tantalizing than gratifying to our curiosity.

"This sacred structure was revered, by the holy knights, above all earthly objects; their enthusiasm had endowed its every stone with marvellous qualities; and they foolishly fancied it a secure passport to heaven, if they lost their lives in defence of the building. As it was their province to protect Christian pilgrims against the Saracens, and as they were originally instituted and stationed at the church of the Holy Sepulchre, it seems extremely probable that they would imitate that structure, when they were afterwards distributed in companies over Europe, and when they had occasion to erect a *new church*. This appears actually to have been the case with those that settled in England; for we have

* The Templars had numerous other places of residence in England, where they established preceptories, &c. In Strype's edition of Stow, 1720, Vol. I. p. 270, it is said that they had *temples* at London, Cambridge, Bristol, Canterbury, Dover, Warwick, &c.

† *Archæologia*, VI. p. 169.

‡ Resurrectionis Domini: *rotunda ecclesia tribus cincta parietibus, duodecim columnis sustentatur.* (De Locis Sanctis, Cap. 2.)

§ See the ground-plan in Sandys's Travels. I have also been favoured with a view of a model of this church, now in the possession of the learned author of *Munimenta Antiqua*.

already seen that they had circular churches at several places,* and some of these were dedicated to the Holy Sepulchre, or Sanctum Sepulchrum. Perhaps the most ancient of these is that at Cambridge, which I now proceed to describe."

The first of the churches engraved, evidently the oldest of the form in England, is that of St. Sepulchre at Cambridge, built in the reign of Henry the first. The upper story of the tower, however, is of the time of Edward the second; and the east end, or chancel, with a northern aisle (marked in the ground-plan by a lighter colouring), is of the date of 1313. St. Sepulchre's church, Northampton, forms the second subject; the circular part of which is attributed by Mr. Britton to the close of the twelfth or beginning of the

thirteenth century, about the time when the use of the pointed arch became first prevalent. The third is the Temple church in London; the exterior wall of the circular part of which, with the great western door, Mr. Britton considers as the remains of the original building of 1185; but the six clustered columns within, with the incumbent arches, and the whole of the square church, he seems justly to attribute to the reign of Henry the third.

Here, for the present, we leave the 'architectural antiquities'; their accuracy and their elegance will at least do permanent honour to the talents of their author. The public must decide in regard to their encouragement.

ART. III.—*The History and Antiquities of Doncaster and its Vicinity, with Anecdotes of eminent Men.* By EDWARD MILLER, Mus. D. 4to. pp. 443.

THE county of York, though the most extensive of any division in England, and comprehending within its boundaries almost every subject that can engage and interest the topographer, antiquary, and natural historian, has never yet been honoured with a complete local history. A few works have been published relating to particular towns and districts in the county: among these the present publication now claims our attention; and demands from us such an analysis and account as will enable our readers to appreciate its character and the abilities of the author. In discharging this duty, we shall endeavour to gratify the expectations of the former, and render strict justice to the latter.

Dr. Miller, in a dedication to the mayor and corporation of Doncaster, observes, that he has now enjoyed an appointment under them for nearly *half a century*. He must, therefore, be far advanced in years,

and from so long a residence in the town, must, or ought to be, well acquainted with its local history and characteristics; and we are entitled to expect ample and well-authenticated accounts of all the principal events which are directly or collaterally connected with his primary subject. In the introduction he develops his plan, and furnishes us with something like a clue to judge of the work.

"This history of Doncaster," he observes, "with the principal towns and villages in its vicinity, it is hoped will afford the reader both entertaining and useful information.

"The receptacles of the dead are here explored—their virtues, their charities, their geniuses recorded.—The learned divine—the brave warrior—the renowned statesman—the ingenious artist, and industrious farmer, all claim a place in these pages.

"The country within this district is picturesque and delightful; it contains so many beauties of nature and vestiges of art, that the description may afford ample scope both for

* "The German writer of 'Voyage en Sicile & dans la Grande Grèce, adressé à l'Abbé Winckelman, Lausanne, 8vo. 1773,' gives this description of a church of St. Sepulchre at Brindisi, the ancient Brundisium. 'On donne l'Eglise du St. Sepulchre pour un temple antique; c'étoit une rotonde; cet edifice n'est point du bon tems de l'architecture: sa forme n'est pas parfaitement circulaire, & il n'y a point de portique à l'entrée, et il décrit un demi-cercle différent, qui ne fait point corps avec le reste du bâtiment; ce qui lui donne une irrégularité désagréable. L'on reconnoit aussi le mauvais goût du tems de la décadence des arts aux ornemens de l'ancienne porte qui est murée aujourd'hui. Cet edifice est vouté, & soutenu entièrement par des colonnes de marbre.'

"This person, who was over head and ears in Roman and Grecian antiquities, would not have thought it worth his while to have taken notice of an ancient Christian temple, as this is no doubt, had he not mistaken it for a pagan one. The description answers exactly to our church of the Holy Sepulchre at Cambridge." British Museum, Cole's MSS. Vol. II. p. 46.

the genius of the poet, and the researches of the antiquary.

"The author, well aware that he is neither possessed of invention requisite for one character, nor of scientific knowledge for the other, would not have presumed to offer this work to the public, had he not been favoured with the kind assistance of many learned friends in the neighbourhood. Their communications have extricated him out of many difficulties, which might otherwise have proved insurmountable; and their kindness and approbation have not only encouraged him to persevere in this undertaking, but to pursue it with gratification and delight.

"Should it be asked why this work was not consigned to able hands? the answer is, authors of genius will rarely submit to the drudgery of compiling; and, perhaps, there is no species of composition which requires more zeal in inquiry, or more labour in procuring and arranging the materials, than in works similar to this now offered to the public.

"To accomplish his purpose, the author has not been satisfied with mere verbal intelligence, nor relied entirely on the kind communications of friends; but has also found it necessary to visit every church, town, and village, of which he has given a description."

After a few more introductory remarks, and acknowledgments to gentlemen who assisted him with information, &c. the author commences his regular history, by a few observations on the west riding of the county of York in general. As Doncaster, and the other towns described in this volume, are all situated in this division of the county, the Doctor, in a very concise manner, notices its boundaries, dimensions, divisions, rivers, &c. and proceeds in his second section, to the 'Natural History of Doncaster, and its vicinity.'—The second section treats of the climate, situation, air, water, soil, vegetables, minerals, and other traits of natural history, which, according to our author, belong to Doncaster, and its vicinity: but the greater part of these are not alone peculiar to this neighbourhood, or even to Yorkshire; they are very general throughout England. In a confined work like this, which relates to a single district of a county, we think it wrong to extend its pages, and enhance its price, by 'Biography,' as it is absurdly termed, of the hedgehog, badger, and various species of birds and beasts, which are very common in almost every part of the kingdom. The practice of thus multiplying books, without adding to the stock of literary information, is among the growing evils of the times.

The general state of agriculture, of woods, and plantations, is the subject of

section III.; in which are introduced some observations on cropping trees, and planting hedges. The latter subject is descanted on in an extract from the *Gentleman's Magazine*.

Having, in the next section, slightly touched on the different names and etymologies of Doncaster, the author, in section V., treats of its ancient state and antiquities, with a description of Doncaster-cross, (of which a wood-cut is given,) and a Roman altar, discovered in 1781. The latter is minutely described and delineated in a print. The sixth section contains a chronological series of 'public and private grants, and other historical events,' relative to the ancient state of Doncaster. In this the author has detailed a particular account of Aske's rebellion, (temp. Hen. VIII.) which is mostly extracted from Rapin's History of England. The following section is devoted to the church, and its antiquities. A well-executed plate is given of the former, which is a large elegant pile of building, and displays the highly ornamented style of architecture which characterised the sacred edifices of the fifteenth century. Such, at least, we are induced to conclude from the print. The south side of the church, here represented, displays nearly an uniform style of architecture, and hence we are led to infer that so much of it was built at one period. The author, however, denies this, and endeavours to prove that the east end was raised "in the fifth year of William the Conqueror, who began his reign 1066."—"As for the present elegant tower," he continues, "its architecture shews it to be of a later period; and it was most probably built during the reign of Henry III. when a great number of our present churches were built." The only authority adduced to justify this opinion is a stone, inscribed 1071, which Doctor Miller possesses, and which he says was taken out of the east end of the wall, about six years ago. Concerning the date of the tower he merely gives us *conjecture*, which appears to be equally fallacious with the inscription: both are doubtful; for the style of windows, &c. at the south-east end exactly correspond with those of the west, (at least, they are so represented in the print,) and the tower is evidently of a much later date than what the Doctor chooses to assign to it. If he will examine some of the churches of Lincolnshire, with their history, he will be likely to find a better criterion to judge of the date of this building, than in the writings of Mr.

Rastall, whose sentiments he quotes. Though the author is extremely concise and unsatisfactory in his *history* of the church, he is triflingly copious upon the tombs, epitaphs, organ, and arms, belonging to it: these are all visible *objects*, and epitaphs are easily transcribed. As connected with the church service, though not peculiarly apposite to the present history, the author informs us that he has "selected, adapted, and composed," some music for the Psalms of David: which has obtained most extraordinary celebrity; and "*the utility of which is evident.*" Had there been less egotism, we should have been better pleased with his remarks on psalmody, and on the caricature singers of country congregations in general.

"The psalmody in this church," he observes, "till the year 1790, was conducted upon the same plan as that of other parochial churches in this kingdom; where the parish clerk had the choice both of the words of a psalm, and the tune to be sung. His custom was to send the organist, not the words, but only the name of the tune, and how often it was to be repeated. Strange absurdity! How could the organist, placed in this degrading situation, properly perform his part of the church service? Not knowing the words, it was impossible for him to accommodate his music to the various sentiments contained in different stanzas; consequently, his must be a mere random performance, and frequently producing improper effects.

"The late vicar of Doncaster, the Rev. George Hay Drummond, about the above period, observing one Sabbath-day, that his clerk had chosen both the words and tune of a psalm so improperly as to occasion laughter in some part of the congregation, told me, that in order to remedy such an abuse in future, he would immediately employ himself in selecting the best stanzas in each psalm from the version of Tate and Brady, and arrange them for every Sunday and festival throughout the year, provided I would adapt them to proper music. I was instantly struck with the idea, and in performing my part, generally made choice of the most popular of our old and venerable melodies long used in the established church of England: when the work was finished, I had great encouragement to publish it, from its being, I believe, the first arrangement of psalms, with tunes annexed to them, and adapted for every Sunday throughout the year, that had been made since the Reformation in the reign of Edward VI.

"His present majesty was graciously pleased to patronize this work; as did also the archbishops, the bishops, and a great number of the inferior clergy. The names of subscribers, with the number of copies for which they subscribed, amounted to nearly 5000;

and most probably before that time, no musical publication in this kingdom had produced so large a list of subscribers.

"The utility of this work is evident. The choice, both of the words and music of a psalm, is no longer left to an ignorant clerk. In every church where this book is used, the organist has both the words and music of the psalm before him, and it must be his own fault if he do not make a judicious use of them, by observing the different sentiments conveyed in different stanzas, and by not overpowering the voices by the use of too many stops in his organ.

"No encouragement is given in this church to a detached set of singers, who are so frequently permitted in our villages to *harlequinade* music, by squeezing through their noses compositions, which they call *su-ges*, to the amazement and derision of the sensible, un-employed part of the congregation.

"In parochial psalmody, no difficult music ought to be used. The tune should be so simple and easy, that all the congregation may readily join in this essential part of their duty; and this, according to the scriptures, they ought to do standing. Many there are, particularly those of rank and eminence, who do not join at all in this high act of devotion, or do it with the utmost indifference, 'irreverently sitting, while they address their God with the voice of supplication, praise, or thanksgiving, as if they sang only for their amusement, or to pass away a few idle minutes, while the minister ascends the pulpit.'"

From the subject of singing, the author immediately adverts to the organ; after describing which, he observes, that

"The reader may suppose what effect this fine instrument had on the parishioners, when erected in the year 1739, as the Rev. Mr. Fawkes, at that time curate, thought it necessary to preach an appropriate sermon on its being opened. Judge of the sublimity of this discourse by the following specimen: after having wound up his imagination to the highest pitch in praise of church-music, speaking of the organ, he said, 'But O what!—O what!—what shall I call thee by? thou divine box of sounds!'"

The remaining part of this section is occupied by a long indenture, relating to a library established in the church; with a catalogue of its books; and a list of livings, chantries, &c. in the deanry of Doncaster.

From what the author properly calls the "dry, and generally uninteresting matter, contained in part of the last section," the reader is led, in the following, to the contemplation of eminent men born in Doncaster, or residing in its neighbourhood. The most conspicuous of these are,

Thomas de Rotherham, archbishop of York (temp. Edw. IV.); Admiral Sir Martin Frobisher (temp. Eliz.); Sir Philip Monckton, and Sir Ralph Knight, who were both distinguished in the civil war of Charles the First; the former an adherent to the king, the latter to the parliament. The memoirs of these two gentlemen are given at considerable length, and relate to some memorable events of that period: those of Sir Philip are chiefly copied from his own hand-writing, and detail many skirmishes and battles that were fought in the civil war, in which he took a very active part.

The present state of Doncaster is the subject of section IX., which treats of the population, corporation, public edifices, (with plates of the mansion-house, town-hall, theatre, and grand stand,) markets, fairs, bridges, chapels, hospital, dispensary, poor-house, schools, and manufactories, with a plate of a patent machine (Mr. Ramsore's) for cutting straw. A description of the theatre introduces some anecdotes of the celebrated G. A. Stevens, with the following characteristic letter, which was addressed by that eccentric genius to Dr. Miller:

"Dear Sir, "Yarmouth gaol.

"When I parted from you, at Doncaster, I imagined, long before this, to have met with some oddities worth acquainting you with. It is grown a fashion of late to write lives: I have now, and for a long time have had leisure enough to undertake mine; but want materials for the latter part of it: for my existence now cannot properly be called living, but what the painters call still-life; having ever since February 13, been confined in this town gaol for a London debt.

"As a hunted hare is always shunned by the happier herd, so am I deserted by the company,* my share taken off, and no support left me, save what my wife can spare me out of her's.

"Deserted in my utmost need,

"By those my former bounty fed.—

"With an economy, which 'till now I was a stranger to, I have made shift hitherto to victual my little garrison; but then it has been with the aid of my good friends and allies—my clothes. This week's eating finishes my last waistcoat: the next I must atone for my error: on bread and water.

"Themistocles had so many towns to furnish his table, and a whole city bore the charge of his meals. In some respects I am like him, for I am furnished by the labours of a multitude. A wig has fed me two days—the trimmings of a waistcoat as long—a pair of velvet breeches paid my washerwoman, and a ruffled shirt has found me in shaving. My coats I swallow by degrees: the sleeves I breakfasted

upon for weeks—the body, skirts, &c. served me for dinner two months—my silk stockings have paid my lodgings—and two pair of new pumps enabled me to smoke several pipes. It is incredible how my appetite (barometer-like) rises in proportion as my necessities make their terrible advances. I here could say something droll about a good stomach; but it is ill jesting with edge tools, and I am sure that is the sharpest thing about me.

"You may think I can have no sense, that while I am thus wretched I should offer at ridicule; but, sir, people constituted like me, with a disproportionate levity of spirits, are always most merry when they are most miserable; and quicken, like the eyes of the consumptive, which are always brightest the nearer a patient approaches to dissolution. However, to shew you I am not entirely lost to all reflection, I think myself poor enough to want a favour, and humble enough to ask it here. Sir, I might make an encomium on your good-nature and humanity, &c. but I shall not pay so bad a compliment to your understanding, as to endeavour, by a parade of phrases, to win it over to my interest. If you could, any night at a concert, make a small collection for me, it might be a means of obtaining my liberty; and you well know, sir, the first people of rank abroad, will perform the most friendly offices for the sick: be not, therefore, offended at the request of a poor, though a deservedly punished debtor.

"G. A. STEVENS.

"George Alexander Stevens began his career on the stage at Norwich, during my early years in that city (being my native place): he met with so much applause there, that he became ambitious to try his fortune in London; where he made his first attempt in the character of Hamlet. There was something in the manner of his acting, so unusual and strange to a London audience, that, during the first act, they suspended their judgment; but in the second, they began to hiss violently; on which he came forward, and addressing himself to the audience, 'What,' said he, 'you don't like it I find!—well, come—I'll give it you in a new taste.' He then began to burlesque the character in such a manner as drew from the audience repeated bursts of laughter and applause."

This section contains a list of the mayors of Doncaster, from 1493 to the present time; accompanied with a series of the most remarkable public events during that period; and concludes with a list of the principal persons residing near the town, in the years 1673 and 1804. The following anecdotes of Doctor Herschel, the eminent astronomer, at Slough, are new to us, and, we presume, will be amusing to our readers: they, at the same time, furnish a fair specimen of the author's style.

* Norwich company.

"As an account of this celebrated astronomer has lately appeared in the volume of Public Characters, for 1802, perhaps the compiler of that work, had he known them, would have made some use of the following particulars:

"It will ever be a gratifying reflection to me, that I was the first person by whose means this extraordinary genius was drawn from a state of obscurity. About the year 1760, as I was dining with the officers of the Durham militia, at Pontefract, one of them informed me, that they had a young German in their band as a performer on the hautboy, who had only been a few months in this country, and yet spoke English almost as well as a native: that, exclusive of the hautboy, he was an excellent performer on the violin, and if I chose to repair to another room, he should entertain me with a solo. I did so, and Mr. Herschel executed a solo of Giardini's, in a manner that surprized me. Afterwards, I took an opportunity to have a little private conversation with him, and requested to know if he had engaged himself to the Durham militia for any long period? He answered, 'No, only from month to month.' 'Leave them then,' said I, 'and come and live with me. I am a single man, and think we shall be happy together; doubtless your merit will soon entitle you to a more eligible situation.' He consented to my request, and came to Doncaster. It is true, at that time, my humble mansion consisted but of two rooms. However, poor as I was, my cottage contained a small library of well-chosen books; and it must appear singular, that a young German, who had been so short a time in England, should understand even the peculiarities of our language so well as to adopt Dean Swift for his favourite author. I took an early opportunity of introducing him at Mr. Copley's concert; and he presently began in

"Untwisting all the chains that tie

"The hidden soul of harmony.

For never before had we heard the concertos of Corelli, Geminiani, and Avison, or the overtures of Handel, performed more chastely, or more according to the original intention of the composers, than by Mr. Herschel. I soon lost my companion—his fame was presently spread abroad—he had the offer of scholars, and was solicited to lead the public concerts both at Wakefield and Halifax.

"About this time a new organ for the parish church of Halifax, was built by Snetzler; which was opened with an oratorio by the late well-known Joah Bates. Mr. Herschel and six others were candidates for the organist's place. They drew lots how they were to perform in rotation. My friend Herschel drew the third lot—the second performer was Mr. Wainwright, afterwards Doctor Wainwright, of Manchester, whose finger was so rapid that old Snetzler, the organ-builder, ran about the church, exclaiming, '*te tevel, te tevel, he run over te key like one cat, he will not give my pipkes room for to shpeak.*' During Mr.
